

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

MACGILLIVRAY

MACGILLIVRAY, ALEXANDER, a chieftain of the Creek or Muscogee Indians, born on the Ocoee river near the present site of Wetumpka about 1740, died in Pensacola, Feb. 17, 1793. His father, Lachlan McGillivray, was a Scotchman of good family, who ran away from home when a boy, came to America, and acquired a large fortune by trade with the southern tribes of Indians. His mother was Sehoy Marchand, the half-breed daughter of a French officer who was murdered in 1732, in a mutiny of his own soldiers, while commanding Fort Toulouse, on the Ocoee river. Alexander received a good education in Charleston, and was noted as a boy for his fondness for books and literature. His father had intended to educate him for commercial life, and at one time he was placed in a counting-house in Savannah; but having no taste for trade, he returned, on arriving at manhood, to his Muscogee relatives. Here he soon rose to a high position among the united tribes of Creeks and Seminoles, and at the breaking out of the American revolution was their recognized head. During the war of the revolution the McGillivrays, father and son, were zealous adherents of the royal cause, and the former held the rank of a colonel in the British service. He left the country with the British when they evacuated Savannah, and his estates were confiscated. After the war, Alexander McGillivray, in behalf of the Muscogee confederacy, entered into an alliance with Spain, of which government he was made a commissary, with the rank and pay of colonel. The trade of the Creeks, under his influence, was directed to Pensacola, and for several years he baffled the most persevering efforts of the governments of the United States and Georgia to open an intercourse with the Creeks, and obtain a cession of certain disputed lands lying on the Ocoee. At length, in 1790, he was induced by Washington to visit New York, where he was received with high honors, and where he eventually signed a treaty yielding the disputed territory. In return for this concession, beside a pecuniary equivalent to the Creeks, McGillivray by a secret article was rewarded with the appointment of agent for the United States, together with the rank and pay of brigadier-general in the army. The provi-

sions of this treaty were not acceptable to the Creeks; it diminished the influence of the chief, and he either was or affected to be unable to prevail upon them fully to comply with it. Meantime, however, he continued to retain his chieftainship, and at the same time actually succeeded in obtaining an increase of salary and of authority from the Spanish government. Although engaged in several military expeditions, in concert with the British, during the revolutionary war, he was less distinguished for military talent than for his skill in controlling the wild chieftains under his command, and the adroitness and ability of his conduct in dealing with the agents of more civilized governments. His hospitality and generosity were almost princely. His deportment was that of a polished gentleman; and his published correspondence affords evidence of his intelligence and education, as well as of his skill as a politician. He was a brother-in-law of the famous Le Clere Milfort, and an uncle of William Weatherford.

MACGILLIVRAY, WILLIAM, a Scottish naturalist, born in the isle of Harris in 1796, died in Aberdeen, Sept. 5, 1852. In 1823 he was appointed assistant professor of natural history in the university of Edinburgh, and subsequently conservator of the museum of the royal college of surgeons. In 1841 he was made professor of natural history in Marischal college, Aberdeen, which office he held till his death. The most popular of his works are: "History of British Birds," "History of British Quadrupeds," and a treatise on "The Flowering Plants and Ferns of Great Britain and Ireland." The queen purchased his MSS. of the "Natural History of Dee-side and Braemar," on account of its being specially illustrative of the vicinity of her highland residence at Balmoral, and caused it to be printed in 1856, and copies of it to be sent to all the societies of natural history throughout her dominions.

MACGREGOR, JOHN, a British statistician and politician, born at Stornoway, Ross-shire, in 1797, died in Boulogne, April 23, 1857. At an early age he was placed in a commercial house in Canada, which gave him opportunities for collecting the particulars of the resources of the country embodied in his work entitled

"British America," which appeared in 1832. On his return to England he was employed on commercial missions to various continental governments, and in 1840 he was appointed one of the two joint secretaries of the board of trade. He became an enthusiastic advocate of free trade measures, and exerted his influence with the late Joseph Hume to cause the appointment in the house of commons of a select committee on the import duties. In 1847 he resigned his office and became a successful candidate for the representation of the city of Glasgow. He established the royal British bank, but lacked the qualifications for the governorship of such an institution, and, to escape the legal investigation which followed its failure, retired to Boulogne, where he died. He was a friend of the historian Sismondi, and dedicated to him his narrative of his tour on the continent ("My Note Book"). He compiled a comprehensive work on the "Progress of America from the Discovery by Columbus to 1846," comprising 3,000 pages, in 2 huge crown 4to. vols. His "Commercial Statistics," in 5 large volumes containing nearly 4,000 pages, appeared between 1848 and 1850, and was followed in 1852 by the first volume of his "History of the British Empire from the Accession of James I.," a work left incomplete at the time of his death.

MACHENRY, a N. co. of Ill., bordering on Wis., drained by Fox and Des Plaines rivers and their branches; area, 470 sq. m.; pop. in 1855, 19,285. The surface is nearly level and the soil fertile. Limestone abounds. The productions in 1850 were 562,269 bushels of wheat, 301,248 of Indian corn, 270,275 of oats, and 45,094 lbs. of wool. There were 3 grist mills, 7 saw mills, 10 churches, and 5,936 pupils attending public schools. The Chicago and north-western, Galena and Chicago union, and Fox river valley and Wisconsin central railroads pass through the county. Capital, Dorr.

MACHIAS, a port of entry and capital of Washington co., Me., on the left bank of the W. branch of Machias river, near its mouth, 151 m. E. by N. from Augusta, and 240 m. N. E. from Portland; pop. in 1850, 1,590. The inhabitants are principally engaged in ship building and the coasting trade. The tonnage of the district, June 30, 1859, was 33,501; for the year ending with that date the arrivals were 4, tonnage 426; clearances 56, tonnage 11,412.

MACILVAINE, CHARLES PETTIT, D.D., an American clergyman, bishop of the Protestant Episcopal church in the diocese of Ohio, born in Burlington, N. J., Jan. 18, 1798. His father, Joseph McIlvaine, was a leading lawyer, and U. S. senator from New Jersey at the time of his death in 1826. He was graduated in 1816 at Princeton, was admitted to deacon's orders, July 4, 1820, by Bishop White, and having labored in Christ church, Georgetown, Md., he received two years later priest's orders from Bishop Kemp of Maryland. In 1825 he became

professor of ethics and chaplain in the U. S. military academy at West Point. In 1827 he became rector of St. Ann's church, Brooklyn, N. Y., where he remained until 1832. He was consecrated bishop of Ohio, Oct. 31, 1832. Bishop McIlvaine has been a large contributor to theological literature. His "Lectures on the Evidences of Christianity," delivered in the New York university in 1831, were published by request of the council, and have gone through 30 editions. At an early period of the controversy arising out of the Oxford tracts, appeared his "Oxford Divinity compared with that of the Romish and Anglican Churches" (8vo., 1841). In 1854 he published a volume of sermons entitled "The Truth and the Life." He has also compiled two volumes of "Select Family and Parish Sermons." In 1853 the degree of D.C.L. was conferred on him by the university of Oxford, and in 1858 that of LL.D. by the university of Cambridge. In 1859 the Rev. G. T. Bedell, D.D., was consecrated an assistant bishop of the diocese.

MACINTOSH, a S. E. co. of Ga., bounded S. E. by the Atlantic ocean, and S. W. by the Altamaha river; area, 550 sq. m.; pop. in 1859, 5,583, of whom 4,224 were slaves. It is drained by the Sapelo river and Jones's and Doctor's creeks. The surface is level and the soil fertile. The productions in 1850 were 34,715 bushels of Indian corn, 53,165 of sweet potatoes, 3,122,919 lbs. of rice, and 520 bales of cotton; there were 2 grist mills, 4 saw mills, 12 churches, and 120 pupils attending school. Capital, Darien.

MACINTOSH, JOHN, a soldier of the American revolution, born in McIntosh co., Ga., died Nov. 12, 1826. With the rank of lieutenant-colonel he had command of the fort at Sunbury, in Liberty co., when it was besieged by Lieut. Col. Fraser, at the head of a considerable body of British troops, who demanded a surrender in an hour's time, threatening, in the event of refusal, to lay the village and surrounding country in ashes. The reply of Col. McIntosh was: "Come and take it;" which the British commander declined to do. At the battle of Brier Creek, March 3, 1779, Col. McIntosh displayed great bravery. With Gen. Elbert he stood his ground until nearly every man around him had been shot down. On surrendering his sword, a British officer attempted to kill him, but was prevented by Col. Aeneas McIntosh of the British army. After the close of the war he removed to Florida, and settled on the St. John's river. Here he was suddenly arrested by a band of Spanish troops and imprisoned in the fortress of St. Augustine, on suspicion of having designs against the Spanish government, and was finally sent to the captain-general of Cuba, and by him incarcerated in the Moro castle at Havana. After nearly a year's imprisonment, he was released, and returned to Georgia, not, however, until he had aided in destroying a fort on the St. John's opposite Jacksonville, and done the Spanish government some other injuries. In the war of 1812 he again took up arms against

the British, and did efficient service.—**JAMES S.**, an American soldier, son of the preceding, born in Liberty co., Ga., June 19, 1787, died in the city of Mexico in 1847. He entered the army in 1812 as a lieutenant, and was attached to the rifle regiment, with which he served in Canada and on the northern frontier. In May, 1814, he aided in cutting off supplies intended for some British ships building at Sackett's Harbor. He subsequently received a severe gun-shot wound in defending the hospitals at Buffalo. He served with Gen. Jackson throughout the Indian war, for a considerable time commanding Fort Brooke at Tampa, Fla. He was afterward stationed at Mobile, at Fort Mitchell, Ga., at several posts in Arkansas, Wisconsin, and Michigan, and finally at Detroit, whence he was ordered to Texas in 1845. He was present at the battles of Palo Alto and Resaca de la Palma, in the latter of which he received a number of severe wounds. He was also at the battles of Contreras, Churubusco, and finally at Molino del Rey, Sept. 8, 1847, where he was mortally wounded at the head of his column.

MACINTOSH, LACHLAN, a soldier of the American revolution, born at Borlaim, near Inverness, Scotland, in 1727, died in Savannah, Ga., in 1806. His father, John More McIntosh, with 130 highlanders, came to Georgia with Gen. Oglethorpe in 1733, and settled in the lower part of the state, at the place now known as Darien, but called by them Inverness. Here young McIntosh gathered from his mother, an educated woman, the ordinary branches of an English education, with mathematics and surveying. In the latter studies he received great assistance from Oglethorpe himself. He became afterward a clerk in a counting house at Charleston, where he remained until called on to take command of the first regiment organized in Georgia. Subsequently 3 regiments were raised, and he was appointed a brigadier-general. In 1777 he fought a duel near Savannah with Button Gwinnett, who died 12 days afterward from wounds received in the combat. Gen. McIntosh now accepted a command in the central army under Washington. He was selected by Washington to conduct a campaign against the Indians in the West, and with a small force succeeded in restoring peace on the frontier. In 1779 he repaired to the South and took command of the Georgia troops at Augusta, whence he subsequently marched to Savannah, in the siege of which place he commanded the 1st and 5th South Carolina regiments, and bore an active part. After the fall of Savannah, he retreated to Charleston, and was present there when the city surrendered to Sir Henry Clinton, May 12, 1780. He remained a prisoner of war for a long time, and never resumed his command, but was a member of congress in 1784, and a commissioner to treat with the southern Indians in 1785.

MACINTOSH, MARIA J., an American authoress, born in Sunbury, Ga., in the early part of the present century. She is descended from

a family of Scottish Jacobites, who for their adherence to the old pretender were compelled in the first half of the last century to emigrate to Georgia. About 1835 she removed permanently to New York; and having suffered pecuniary reverses soon after, she resorted to her pen as a means of support, publishing in 1841 her first tale, "Blind Alice," under the pseudonyme of "Aunt Kitty," by which she continued subsequently to be known. It was followed by "Jessie Graham," "Florence Arnott," "Conquest and Self-Conquest," "Praise and Principle," and other tales published between 1841 and 1846, each of which was designed to inculcate some moral sentiment. In 1846 she published a work entitled "Two Lives, or to Seem and to Be," and in the succeeding year her stories were collected in a single volume. Her remaining works are: "Charms and Counter-Charms" (1848); "Donaldson Manor" (1849); "Woman in America" (1850); "The Lofly and the Lowly" (1853), a picture of life on a southern plantation; "Violet, or the Cross and the Crown" (1856), and others.

MACK VON LEIBERICH, KARL, baron, an Austrian general, born at Neuslingen, Franconia, Aug. 25, 1752, died in St. Pölten, Oct. 23, 1828. He rose from humble life to a high position in the army, served in Turkey under London, and against France in the Netherlands in 1792-'3. Appointed in 1798 generalissimo of the Neapolitan troops, he was defeated by MacDonald and Championnet, and incurring the suspicion of the Neapolitans, gave himself up to the French generals, by whom he was sent as prisoner to Paris, but made his escape and was appointed to a new command in S. W. Germany in 1805. Although able in the war office, and popular with the soldiers, he was wholly deficient in the qualities of a commander in the field. He was devoted to the Austrian nobility, who treated him with the utmost contempt on account of his plebeian origin. The consequence of placing a man of his mediocrity against the greatest military genius of modern times became evident when Mack, surrounded by Napoleon's armies, surrendered the fortress of Ulm (Oct. 17, 1805) with a garrison of about 24,000 men. "On the morning of Oct. 20," says Schlosser, "the French exhibited the spectacle of a triumph at Ulm, which had a more powerful influence on the subsequent undertakings during the war than any species of reward could have produced; the Austrians, among whom were 18 generals, marched past Napoleon, laid down their arms before the conqueror, deposited 40 stands of colors at his feet, and delivered up 60 pieces of artillery." Mack was sentenced to death by an Austrian court martial; his sentence was commuted to perpetual imprisonment, and he was set free after 2 years' detention. He was deprived, however, of all his honors and dignities, and was not pardoned till 1819.

MACKAY, CHARLES, LL.D., a British author, born in Perth in 1812. He was partly educated in Brussels, and after returning to

England, published a volume of poems. In 1834 he became attached to the staff of the "Morning Chronicle" newspaper, and so remained for 9 years, writing during the time another volume of lyrics, the principal of which is "The Hope of the World." In 1844 he became editor of the "Glasgow Argus," but relinquished this post in 1847. During the previous year he had received from the university of Glasgow the degree of LL.D., and also published a work on the "Education of the People," a collection of poems which had originally appeared in the London "Daily News," and "Scenery and Poetry of the English Lakes." In 1848 he returned to London, where he published in the same year "Town Lyrics and other Poems." In 1849 appeared his "Bottle," a series of sketches illustrated by George Cruikshank, a work which attained great popularity. In 1858 he made a tour through the United States, where he delivered lectures on the subjects of song-writers and poets. He addressed from the United States a series of letters to the "Illustrated London News," with which journal he had been connected for some time previous to his departure. These letters afterward appeared in a volume entitled "Life and Liberty in America." Among his other works are: "Egeria, or the Spirit of Nature and other Poems" (London, 1850); "Longbeard, or the Revolt of the Saxons," a romance (3 vols. 8vo., 1850); "Memoirs of Extraordinary Popular Delusions" (3 vols. 8vo., 1851); "The Salamandrines" (1853), his longest poem; "The Lump of Gold," the "Songs of the Brave," and "Under Green Leaves" (1856); and "A Man's Heart" (1860). Many of Mr. Mackay's songs have attained great popularity, and the music to which they are set is in some cases of his own composition. In July, 1860, he established the "London Review," a weekly journal of politics, literature, art, and society.

MACKEAN, a N. co. of Penn., bordering on N. Y.; area, 1,142 sq. m.; pop. in 1850, 5,564. It is drained by the Alleghany river and branches, by the sources of the Clarion river, and numerous creeks. The surface is hilly, the soil of slate and shale formation, and it abounds with coal, iron, and salt. The productions in 1850 were 10,173 bushels of Indian corn, 29,974 of oats, and 9,657 lbs. of wool. There were 2 grist mills, 38 saw mills, 1 iron foundry, 5 churches, and 973 pupils attending schools. Capital, Smithport.

MACKEAN, THOMAS, an American jurist and statesman, and a signer of the declaration of independence, born in Chester co., Penn., March 19, 1734, died June 24, 1817. In 1765 he was elected a member of the Pennsylvania assembly, to which he was annually returned for the next 17 years. In 1765 he attended the general congress of the colonies which assembled at New York, and formed one of the committee who framed the address to the British house of commons; and in the same year he was appointed judge of the court of common

pleas for Newcastle county. In Sept. 1774, he took his seat in the first continental congress, as a delegate from the lower counties in Delaware, and continued to discharge the duties of that office until Feb. 1783, being the only member who served during the whole revolutionary period without interruption. In 1781 he was elected president of congress. He was an energetic whig, and was active in urging the adoption of the declaration of independence. While occupying a seat in congress from Delaware he was in 1777 appointed chief justice of Pennsylvania, and in the same year he also officiated as president of the state of Delaware, for which he drew up a constitution. He was chief justice of Pennsylvania until 1799, when he retired from the bench on being elected governor of the state. His administration lasted until 1803, when he withdrew definitively from public life. As a jurist he held a high position for integrity, impartiality, and learning. In politics he was one of the leaders of the republican party, the ascendancy of which in Pennsylvania was in no small degree owing to his exertions.

MACKEEVER, ISAAC, a commodore in the U. S. navy, born in Pennsylvania in April, 1798, died in Norfolk, Va., April 1, 1856. He entered the navy as a midshipman in Dec. 1809, was made a lieutenant in 1814, and commanded one of a flotilla of 5 gun boats under the command of Lieut. Thomas ap Catesby Jones, which was captured by a British expedition upon Lake Borgne, La., in Dec. 1814. The gun boats mounted, collectively, 23 guns, and were manned by 182 men. The British expedition consisted of 49 large barges and other boats, manned by over 1,000 seamen and marines. The engagement, which was very severe, lasted more than 8 hours, and over 200 of the British were killed and wounded. Lieut. McKeever's vessel was the last one attacked, and he was severely wounded, together with most of his officers, before he surrendered. He became a commander in May, 1830, and a captain in Dec. 1838, performing much active service in both grades. He commanded the squadron on the coast of Brazil from 1851 to 1854. In 1855 he commanded the navy yard at Norfolk, Va., when a terrible pestilence broke out in that city and the adjacent towns. He was authorized by the navy department to suspend the operations of the establishment, and leave it for a time if he saw fit; but he decided to remain, that work might be afforded in the navy yard to those who had no other means for the support of their families.

MAOKENDREE, WILLIAM, an American clergyman, bishop of the Methodist Episcopal church, born in King William co., Va., July 5, 1757, died March 5, 1835. He joined the patriot party in the American revolution, and rose to the rank of adjutant in the army. During a season of remarkable religious interest in Virginia in 1787, he resolved to enter the ministry, joined the Methodist conference, and at the expiration of 4 years was ordained an elder. He

was appointed to several offices of importance and trust, was one of the delegates of the first general conference which elected its members, and was afterward made presiding elder of a new conference in what was then the far West, comprising Ohio, Kentucky, Tennessee, and parts of Virginia and Illinois. He had but 13 assistants to labor in these wide fields, but his zeal, eloquence, and great physical strength enabled him to discharge his functions with wonderful success. On May 12, 1806, he was chosen bishop. During the first year he was almost continually with Bishop Asbury, visiting nearly all parts of the United States and a part of Canada. Until the last year of his life, despite old age and bodily infirmities, Bishop McKendree attended the conferences, travelling when he could no longer sit up in the carriage, and sometimes carried in an almost fainting condition into the house.

MACKENZIE, SIR ALEXANDER, a Scottish traveller, born probably in Inverness, died in 1830. He emigrated to Canada when a young man, and obtained a situation in the counting house of Mr. Gregory, one of the partners in the north-west fur company. In 1789 his employer determined to send him on an exploring expedition through the regions of the north-west, and in the summer of that year Mackenzie set out from Fort Chippewyan, on Lake Athabasca, where he had been stationed for 8 years, with 4 canoes and a party of 12 persons, to accomplish this mission. For 6 weeks he threaded his way along the rivers and lakes of British America, till he reached the great northern ocean in lat. 69°. Having returned to Fort Chippewyan, he started in Oct. 1792, to explore the country toward the Pacific, reaching that ocean July 23, 1793, and regaining in safety the point of departure. He published a detailed account of these explorations, under the title of "Voyages from Montreal, on the River St. Lawrence, through the Continent of North America, to the Frozen and Pacific Oceans, in the years 1789 and 1793" (London, 1801). In consideration of his services he received the honor of knighthood in 1803; and the river by which he had descended from Slave lake to the Arctic ocean was called after him.

MACKENZIE, ALEXANDER SLIDELL, a commander in the U. S. navy, born in New York in April, 1808, died in Tarrytown, N. Y., Sept. 12, 1848. His name was originally Slidell; that of Mackenzie, the name of his mother, was added to his own in 1837, at the request of a maternal uncle. He entered the navy as a midshipman in Jan. 1815, and made his first cruise to the Mediterranean in the frigate Java, commanded by Capt. Oliver H. Perry. In Jan. 1835, he was promoted to the rank of lieutenant, and in Sept. 1841, to that of commander, in both which grades he performed much active service in the Mediterranean, West India, the Brazilian waters, and the Pacific, and was distinguished as an accomplished and zealous officer. In 1842 he commanded the brig Somers of 10 guns, manned

chiefly by naval apprentices; and on his passage from the coast of Africa in the autumn of that year, the existence of a mutinous plot on board was discovered, the principals of which were immediately placed in close confinement. A council of officers was called, which, after a careful investigation, decided that the conspiracy had already attained a formidable growth; and as the mutinous spirit evidently increased, even while the investigation was in progress, the immediate execution of the three persons principally implicated was recommended. This recommendation was carried into effect at sea, Dec. 1, 1842. The Somers soon afterward arrived in New York, when a court of inquiry, composed of Commodores Stewart, Jacob Jones, and Dallas, was immediately ordered to investigate the affair. The result was a full approval of the conduct of Mackenzie. Subsequently, a court martial was held upon him at his own request, of which Commodore John Downes was president, and the trial, which occupied over 40 days, resulted in his acquittal. Mackenzie was the author of several works of merit. His first book, "A Year in Spain," which appeared in 1829, was received with great favor both in Europe and America. His subsequent works were a series of popular essays on naval subjects, "The American in England," "Spain Revisited," a revised edition of the "Year in Spain" published in 1836, and biographies of Com. O. H. Perry, Stephen Decatur, jr., and John Paul Jones, the latter being a contribution to Sparks's "American Biography."

MACKENZIE, DONALD, an American merchant, born in Scotland in 1788, died in Mayville, Chautauque co., N. Y., Jan. 20, 1851. He emigrated to Canada in 1800, and, after being employed for several years in the service of the north-west company, became in 1809 a partner with John Jacob Astor of New York in his project for establishing a trade in furs west of the Rocky mountains. He travelled across the continent to the mouth of the Columbia river, an undertaking then surrounded with perils, and remained at Astoria until the surrender of the place to a British force in 1814; when, having converted whatever he could into available funds, he again traversed the wilderness to the Mississippi, reaching New York in safety. He was subsequently unsuccessfully employed in negotiations to secure to the United States the exclusive trade with Oregon; and in 1831 he entered the service of the Hudson's Bay company as member of the council and chief factor. He retired in 1832 with a fortune, and settled in Mayville.

MACKENZIE, HENRY, a Scottish author, born in Edinburgh in Aug. 1745, died there, Jan. 14, 1831. He was educated at the high school and university of Edinburgh, prepared himself for practice in the court of the exchequer, studying the English exchequer practice in London in 1765, and ultimately became attorney for the crown in Edinburgh. While in London he began his first and best novel, "The

"Man of Feeling," which was published anonymously in 1771. Its popularity induced a Mr. Eccles of Bath to lay claim to the authorship, and to support his pretensions by a copy transcribed in his own hand, with interlineations and corrections. It became necessary, therefore, for Mackenzie to acknowledge himself the author through a formal statement by his publishers. He was an ornament of the literary circles of Edinburgh, which then included Hume, Robertson, Adam Smith, and Blair, his professional duties allowing him leisure both for literature and society. His second novel was "The Man of the World" (1788), the hero of which grasps at happiness in defiance of the moral sense, ruins himself, and afflicts his friends; while the hero of the former, with almost excessive purity and delicacy of mind, is characterized only by fine and generous sentiments. The last of his longer novels was "Julia de Roubigné," in a series of letters, marked even more than the others by pathos and melancholy. He had previously been one of a society of literary lawyers in Edinburgh, by whom a series of papers, modelled after the "Spectator," had been projected. He was the editor of the "Mirror," which appeared once a week for 17 months from Jan. 1779, to which he contributed 42 papers; and of the "Lounger," which continued for about two years from Feb. 1785, to which he furnished 57 papers. In the former he published his "Story of La Roche," and in the latter he was the first to appreciate the poems and genius of Burns. He was one of the original members of the royal society of Edinburgh, to the "Transactions" of which he furnished a memoir on German tragedy, highly commending the "Emilia Galotti" of Lessing and the "Robbers" of Schiller. For the highland society he wrote a "Report on the Ossianic Controversy," against the genuineness of the poems. In 1798 he prepared a life of the blind poet Blacklock for an edition of his works; and in 1812 he read before the royal society a life of Home, the author of "Douglas," which sketched the literary society of Edinburgh during the latter part of the last century. He was likewise the author of political tracts in the tory interest, and in 1804 received the lucrative appointment of comptroller of taxes for Scotland, which he held till his death. His collected works (8 vols., 1808) contain 3 tragedies, two of which had been previously performed. He passed his last years in the society of friends, enjoying his favorite sports of shooting and fishing, and occasionally writing on matters of taste; for, he said, "the old stump would still occasionally send forth a few green shoots."

MACKENZIE, ROBERT SHELTON, D.C.L., a British and American journalist, born in Drew's Court, Limerick co., Ireland, June 22, 1809. He was educated at a school in Fermoy, where his father, originally an officer in the British army, occupied the position of postmaster; and at the age of 13 was apprenticed to a

surgeon apothecary in Cork, with whom he remained 8 years. After passing his medical examination he opened a school in Fermoy, and in 1829, having already had some experience as a newspaper reporter, he became the editor of a country journal published in Staffordshire, England. In 1830-'31 he was employed in London in writing biographies for a work called the "Georgian Era," and in revising the contributions of others; and for a number of years subsequent he acted as editor of a variety of newspapers, including the "Liverpool Journal." Between 1834 and 1851 he was the English correspondent of the "New York Evening Star," beside contributing extensively to various American periodicals. In 1845 he became editor and part proprietor of a railway journal in London, and in 1847 was an active member of Lord Brougham's law amendment society. In the latter part of 1852 he arrived in New York, where for several years he was a writer for several of the principal journals; and in 1857 he became literary and foreign editor of the "Philadelphia Press," a position which he still holds. In addition to his labors as a journalist, he has been a prolific author of original works and compilations, extending from 1829 to the present time. Among these are: "Lays of Palestine" (1829); "Titian," an art novel, the scene of which is laid in Venice (8 vols. 8vo., 1843); "Partnership en Commandité," a legal and commercial treatise on the advantages of that system (8vo., 1847); "Mornings at Matlock" (3 vols. 8vo., 1850), a collection of fugitive magazine pieces; Sheil's "Sketches of the Irish Bar" (New York, 1854), with memoirs and notes; an edition of the "Noctes Ambrosianae," with sketches of the principal contributors and numerous notes (5 vols. 12mo., New York, 1854); "Bits of Blarney" (12mo., 1855); an edition of Curran's life by his son (12mo., 1855); one of Dr. William Maginn's writings (5 vols. 12mo., 1855-'7), and others. Among his latest publications are: "Tressilian and his Friends" (12mo., 1859), and an edition of the "Memoirs of Robert Houdin" (1859).

MACKENZIE RIVER. See HUDSON'S BAY TERRITORY, vol. ix. p. 325.

MACKEREL, a well known scanthopterygian fish of the scomberoid family, and one of great utility to man, from its countless numbers and excellence as food. This family includes also the bonito (see BONITRO) and its allied forms, the tunny, the pilot fish, and the sword fish. The scales are small, delicate, and smooth, the bones light, the tail slender, and gill covers unarmed; the first dorsal fin continuous, the rays of the second and of the anal detached, forming finlets, and with a large interval between the dorsals; the body is fusiform, the caudal fin powerful, the tail usually with a slight keel on the side, the vertical fins without scales; a row of small conical teeth in each jaw; branchiostegal rays 7; most of the species have no air bladder. The common European mackerel

(*scomber scombrus*, Ouv.), so well known for the beauty and brilliancy of its colors and the elegance of its form, has a pointed nose, the under jaw the longer, the gill covers large and smooth, the pectorals and ventrals in advance of the dorsal, the former the most anterior, 5 finlets above and below the tail, vertically over each other, and the tail crescent-shaped; the color above the lateral line is fine green varied with blue, and marked with broad, descending, undulating, dark lines; the lower parts are silvery with golden tints. According to Anderson, the mackerel performs migrations almost as extensive as the herring; it probably inhabits almost every part of the European seas, and comes into shallow water at particular seasons to breed; were it not for these periodical visits, no effective fishery could be carried on, as it would be impracticable to follow the shoals over the ocean; great as is the number caught, it is very small compared with those which escape. It is caught on the shores of Great Britain from March to June, spawning in the latter month; the young, called shiners, are 6 inches long by the end of August; in winter they retire to deep water, though a few are taken on the Cornish coast all the year round; as many as 500,000 eggs have been counted in a single female. The mackerel is very voracious, feeding principally on the fry of other fish; it grows rapidly, and attains an average length of 15 inches, and a weight of 2 lbs., though some considerably exceed this. It is considered better in May or June than earlier or later in the season; the flesh rapidly becomes soft, and must be eaten soon after being taken from the water; much of the flavor, however, is retained in the salted fish. The mackerel season is a very busy and profitable one on the British coasts, a single boat's crew sometimes gaining £100 in a night's fishing. They are taken in large quantities by drift nets, reaching about 20 feet below the surface, and extending for more than a mile; these are set in the evening, and the fish, roaming at night, are caught in the meshes and retained by the pectoral fins; they are caught also in seines and by trailing. The mackerel will bite at almost any bait, especially any thing resembling a living prey, and will even dart at a piece of red cloth or leather; it generally takes the hook not far below the surface. The Spanish mackerel (*S. colias*, Gmel.), found abundantly in the Mediterranean, occasionally upon the French and English coasts, and perhaps even in American waters (though a different species from that commonly known here by that name), is about as large as the last, with larger scales, and with the dark undulations of the back more complicated and the whole surface more or less spotted with gray; it has an air bladder, which the common species has not; it is far inferior also as an article of food. Mackerel of these and many other species, described in ichthyological works, are found in all the northern seas from Greenland to the Mediterranean, in the Black sea and that

of Azof, and in the waters of Australia, the East Indies, the Cape of Good Hope, the North Atlantic, and the American coasts; they have everywhere, and from remote antiquity, maintained a high rank as an article of food. Not only man, but many species of cetaceans and fish, prey upon the mackerel; among their greatest enemies in our waters are the horse mackerel or tunny and the blue fish. From the perishable nature of their flesh, it is permitted in many English seaports to cry them in the streets on Sundays.—The common mackerel of our coast is the *S. vernalis* (Mitch.), of a dark green color above, with beautiful undulations of a darker color extending below the lateral line; the top of the head is dark, almost black, and a large black blotch extends backward from the occiput to the gill covers; behind the eyes cupreous; gill covers silvery, sides white with cupreous reflections, and abdomen white; beneath the lateral line is a fuliginous line, often interrupted, extending the whole length of the fish. The fins and finlets are much like those of the European species. This mackerel is caught in the waters of Massachusetts bay from the 10th of May through the summer, in some seasons in great quantities and in others hardly at all; most of the first comers are males, large but lean, and when cured are ranked as No. 3; these are taken in nets in the vicinity of Provincetown, this mode of fishing lasting for a month or 6 weeks. After the spring visit they return in the autumn, but are then usually taken in smaller quantities. Mackerel are inspected before they are barrelled, and are divided into 4 distinct qualities; No. 1 includes those over 13 inches long; No. 2, those under this size, but fat; No. 3, those 13 inches long, but poor; and No. 4, such as are less than 13 inches, and poor. After July 1 they will generally take the hook, but sometimes from unexplained causes not a fish of countless numbers will bite; indeed, no other fishery of late years, near the shore, has been so capricious and uncertain, either because the fish have found food in abundance elsewhere, or have been terrified by some of their numerous enemies. From 8,000 to 10,000 barrels are sold fresh in Boston market every year, and from 200,000 to 300,000 are annually inspected in Massachusetts, which are worth about \$1,500,000; the number caught varies greatly from year to year, from the causes above alluded to. In some years the number of vessels from Massachusetts alone engaged in this fishery has been nearly 1,000, employing in the various processes of catching, salting, and packing more than 5,000 persons. The smaller specimens, or tinkers, and various other fishes, are ground up for bait, which is allowed to become rotten, and in this strong-smelling state is scattered on the surface of the water in order to attract the shoals. A large proportion of the poorest quality is exported to the East and West Indies and to South America; the better qualities find a ready market in New York, Philadelphia, and cities further south, and especially in the slave-

holding states. Mackerel are caught in great quantities along the coast of the British provinces; in 1857, in Nova Scotia alone, nearly 86,000 barrels were inspected, and in some years the number has been much greater.—The fish called Spanish mackerel on our coast, *S. Debayi* (Storer), much resembles the European *S. colias* (Gmel.), but is more robust, with more numerous spots, and with an interrupted dull brown band beneath the lateral line, extending from beneath the pectorals in a straight line to the tail. It is far less common than the *S. vernalis*; it is generally fat, and is regarded by epicures as a superior fish for the table; its usual weight is somewhat less than a pound. Another scomberoid belonging to the genus *cybium* of Ouvier (*C. maculatum*, Cuv.) is also called the Spanish or spotted mackerel; the body is elongated, but without the pectoral corslet of the tunny; there is an elevated crest on each side of the tail, and a smaller one above and below it; the teeth are large, compressed and sharp, short and even on the palate bones. The length is about 20 inches; the color above is dark leaden, lighter on the sides; the jaws, gill covers, and abdomen clear white, with a satin lustre; the dorsal ridge dark green; 20 or more circular or oblong spots on the sides above and below the lateral line, most of them above the line and anterior to the 2d dorsal; the membrane of the 1st dorsal black, the 2d leaden, pectorals black below and light above, and the ventrals white; the rays of the 1st dorsal project beyond the membrane; the 2d dorsal triangular, emarginated behind; there are 8 or 9 finlets between the caudal and the 2d dorsal and the anal. It extends from South America as far as the coast of Maine, and is esteemed as food; it was more common than usual during the summer of 1859 in the waters of New York, Connecticut, and Massachusetts.

MACKEY, ALBERT GALLATIN, an American physician and author, born in Charleston, S. C., in 1807. He obtained by teaching school the means of preparing himself for the medical profession, and was graduated at the medical college of South Carolina in 1832, obtaining for his Latin thesis *De Gastridite* the first honors and a prize. For 5 years he practised medicine in the parishes of St. Paul and St. Bartholomew, S. C., when he married and settled at Charleston. In 1838 he was elected demonstrator of anatomy in the medical college of South Carolina. In 1844 he abandoned his profession from a strong taste for letters, and a passion for the study of symbolism and the occult sciences, and divided his time between miscellaneous writing and freemasonry. He was connected with the "Literary Bulletin," "Southern Patriot," "Evening News," and other periodicals of Charleston. In 1850 he established a masonic monthly, which was maintained almost solely by his own pen for 8 years. In 1858 he established a "Quarterly" devoted to the same interests, which he continued for 2 years. He acquired almost unaided the Greek, Latin, Hebrew, and most of the continental languages. He has lec-

tured much upon the temperaments, the influence of organization upon mind, and the intellectual and moral development of the middle ages. Latterly, he has devoted his attention more exclusively to his favorite study of abstruse symbolism, which has led him to cabalistic and Talmudic researches; and he is now preparing an elaborate work on symbolism. His published writings, beside contributions to periodicals, are: a "Lexicon of Freemasonry" (Charleston, 1845), a standard work among masons; "The Mystic Tie" (Charleston, 1849); "Principles of Masonic Law" (New York, 1856); "Book of the Chapter" (New York, 1859); and "Text Book of Masonic Jurisprudence" (New York, 1859). Most of these have already passed through several editions, and are of high authority in England and America.

MAOKIE, JOHN MILTON, an American author, born in Wareham, Mass., in 1813. He was graduated in 1832 at Brown university, where he was tutor from 1832 to 1838, and subsequently travelled in Europe. In 1845 he published a "Life of Godfrey William von Leibnitz," and in 1848 contributed to Sparks's "American Biography" a "Life of Samuel Gorton." In 1848 appeared his "Cosas de España, or Going to Madrid via Barcelona." Mr. Mackie is known as a contributor to the "North American Review" of a number of articles on various subjects, principally on German literature and history. He has also written a "Life of Schamyl, the Circassian Chief" (Boston, 1856), and "Life of Tai-Ping-Wang, Chief of the Chinese Insurrection" (New York, 1857).

MACKINTOSH, SIR JAMES, a British statesman and philosopher, born in Aldourie, near Inverness, Scotland, Oct. 24, 1765, died in London, May 22, 1832. His father, the proprietor of a small estate, the inheritance of his family for more than two centuries, served 24 years in the army, and was severely wounded in the battle of Freilinghausen in the 7 years' war. James was educated with great care by his mother, who lived with her mother and sisters, until at the age of 10 he was sent to school at Fortrose. "The only infant in a family of several children," he writes in his autobiographical sketch, "they rivalled each other in kindness and indulgence toward me, and I think I can at this day discover in my character many of the effects of this early education." He already evinced that predilection for abstract speculation which distinguished his intellectual character, an interest in theological controversy being his inducement, as he remarks it has been the general inducement of individuals and nations, to prosecute metaphysical inquiries. The study of Bishop Burnet's commentary on the 17th Anglican article led him to ponder the subject of predestination, and at the age of 14 he adopted the doctrine of the freedom of the will. His autobiography shows his singular interest at this time in Roman and Byzantine history, his habit of various and desultory read-

ing, and his proneness to revery. He was regarded as a prodigy of learning, was employed at school to teach what he knew to the younger boys, and had become a prolific versifier when in 1780 he entered King's college, Aberdeen, where he remained till 1784, passing his vacations in the house of his grandmother. One of the works which he read out of course was Warburton's "Divine Legation," to which in part he ascribes his fondness for "the twilight of historical hypothesis," and his passion for investigating the rise, progress, and decline of opinions. Of his fellow students, Robert Hall, his senior by one year, was the one whose society and conversation had most influence on his mind. In Greek, Hall preferred Plato and Mackintosh Herodotus, and in their walks they were often pointed out as "Plato and Herodotus." But their most common subjects of disputation were the abstruse questions of morals and metaphysics. For months and even for seasons in succession they debated every important position in Berkeley, Butler, and Edwards, each cordially acknowledging through life his obligations to the other. Under their auspices a society was instituted of which they were the centres of attraction, which was jocularly designated "the Hall and Mackintosh club." Mackintosh left Aberdeen with literary ambition and with a preference for the legal profession, but his father's fortune was too small for him to venture on so uncertain a pursuit. His eagerness for books suggested bookselling as an eligible occupation, and he was always of opinion that a highly educated man of moderate fortune would find the life of a bookseller in London very agreeable. His deliberations terminated in the choice of medicine, in which he began his studies in Edinburgh in Oct. 1784. Surrounded by intellectual celebrities, his attention was engrossed rather by speculation than study—medicine, metaphysics, politics, and literature contributing almost equally to his general culture. He became president of the academic royal medical society, "then divided into Callenians and Brunonians, the Catholic church and the heretics," and was one of the most zealous supporters of Brunonianism. He was also a member and a prominent speaker of the celebrated speculative society, among the leaders of which at that time were Benjamin Constant and Thomas Addis Emmet. Three years were thus spent in a university, than which, he says, it is not easy to conceive one "where industry was more general, where reading was more fashionable, where indolence and ignorance were more disreputable." Having obtained his diploma, he set out for London, arriving there in a period of intense political excitement. He found debate in political clubs, the eloquence of Burke and Sheridan at the trial of Hastings, and the charms of society far more congenial to his tastes than the life of a medical practitioner. He contemplated a professional establishment in St. Petersburg, but the project was abandoned. Other schemes failed. While his plans were

thus undetermined, and he felt the pressure of pecuniary difficulties, he married a young lady without fortune, and found himself at the age of 24 with no prospect of professional settlement, with his property rapidly diminishing, and with a wife. The malady which attacked the king in 1788, and largely occupied the public attention, led him to advertise a work on insanity, a considerable portion of which was written, but which was never published. During the struggle concerning the regency he made his first public appearance in politics, the field then most congenial to his thoughts, by writing a pamphlet in support of Mr. Fox. In 1789 he made a tour with his wife through the Netherlands to Brussels, and on his return to London he contributed articles on the affairs of Belgium and France to the "Oracle" newspaper, which led to his superintendence of the foreign department of that journal. From this period dates his resolution to study law and change his profession. After exercising his powers as a writer for the newspaper press, and cultivating them again in retirement, the irreconcilable sobriety which rent the whig party of England furnished the occasion for the first public demonstration of his abilities. Mr. Burke's "Reflections on the French Revolution" thoroughly aroused the public mind, and was generally received with enthusiasm by the better educated classes, and with indignation by those who favored the French principles of liberty. Numerous replies were immediately published and forgotten, Thomas Paine alone having answered him with nearly equal strength, but with too much coarseness and dogmatism to attract those most influential in society. In the *Vindicta Gallica* (April, 1791) Mackintosh appeared as the apostle of liberalism, with a sobriety, a command of moral and political science, an amiability of feeling, and a beauty of style and illustration which placed him at once in the front rank of the party which was upholding the cause of France. This work enjoyed the praise of both Fox and Burke, his acquaintance was sought by the most eminent whigs of the day, the highest hopes were conceived of him, and upon the formation of the association of the friends of the people he became its secretary, in which semi-official character he defended its principles in a letter to Pitt. Applying himself more particularly to legal studies, he was called to the bar in 1795, and attached himself to the home circuit. But the technicalities of the law were distasteful to his generalizing and philosophical mind, and exursive reading and occasional contributions to periodicals divided his attention, when in 1797 he suffered a severe affliction in the loss of his wife. "She gently," he wrote, "reclaimed me from dissipation; she propped my weak and irresolute nature. . . . To her I owe whatever I am; to her whatever I shall be." For several years he devoted himself with more concentration of thought and purpose than at any other period of his life to the study of general or international law, in which his mind

found opportunity to delight itself with general principles. It was a subject also in which current events tended to excite an interest. In 1799 he formed the plan of a series of lectures upon the law of nature and of nations, for which the benchers of Lincoln's Inn granted him the use of their hall. The introductory discourse met with instant and brilliant success. It was published, read, and commended by men of all parties, and would alone be a remarkable monument of intellectual breadth and strength. The lectures were twice delivered in successive years before audiences of a distinction unrivalled on any similar occasion; and the ostentatious support of the ministry, in consequence of the widely different view which he took of the French revolution from that which appeared in the *Vindicta Gallica*, tended to alienate from him the prominent men of his own political party. "The opposition," he said, "mistook the moral character of the revolution; the ministers mistook its force; and both parties, from pique, resentment, pride, habit, and obstinacy, persisted in acting on these mistakes after they were disabused by experience." The reputation which his lectures conferred favored his professional advancement, and for a few years he was chiefly occupied with legal practice. His forensic reputation was raised to its highest point by his effort as counsel for Peltier (Feb. 21, 1808), accused of libel on the first consul of France. "I perfectly approve of the verdict," wrote Erskine, "but the manner in which you opposed it I shall always consider as one of the most splendid monuments of genius, learning, and eloquence." Though Mackintosh held an eminent rank at the bar, his income was not equal to the expenditure required by his social position and habits, since he had married a second time. His eagerness, also, to secure a period of leisure for the gratification of his intellectual tastes induced him to seek a professional situation in India; and by the friendly interest of Canning he obtained the recordership of Bombay, and in connection with it the honor of knighthood. During the interval before his departure he met on two or three evenings of every week a small party, anxious to show their respect and to enjoy his conversation, which regularly included Mr. Horner, Mr. Rogers, and the Rev. Sydney Smith. He remained 8 years in India, receiving in 1806 the additional appointment of judge of the admiralty court, and his official conduct won general favor. He had resolved from the beginning to do all in his power to promote the progress of knowledge within the sphere of his influence, and among other means he founded the literary society of Bombay for the investigation of the philosophy, arts, literature, geography, and history of India. He was elected its president, opened its proceedings with an elaborate introductory discourse, prosecuted a wide range of studies, and was consulted by men of talent in every part of India on their literary projects. He returned to England, with broken health, in 1812. He had been to El Dorado, but had forgotten

the gold; and was obliged to confess to his friends that he was ashamed of his poverty, since it showed a want of common sense. Mr. Perceval immediately offered him a seat in parliament with intimations of future advancement, but he declined it on the ground of the implied condition that he should support the ministry, and he also refused appointments in the ministries of Canning and Lord Liverpool. In 1818 he was returned to parliament on the whig interest for the county of Nairn, and retained his seat successively for Nairn and Knarborough during the remainder of his life. Though he held from the first a high place, it was rather from his preeminence on great occasions than from his efficiency in the ordinary business of the house. His style of oratory, rather academic than forensic, was often too elaborate for a busy and impatient assembly. In 1818 he was appointed professor of law in the college at Haileybury, thus for the first time obtaining a station for which he was confident he was by nature best fitted, and discharged its duties with distinguished success till 1824. In 1827, on the coalition of the whigs with Canning, the latter was surprised that the name of Mackintosh was not one of those submitted to him for office. Under Lord Grey's administration in 1830 he became only a member of the board of control, though a seat in the cabinet was generally expected for him. His last great political effort was a speech advocating the reform bill (July 4, 1832). His death, hastened by a slight accident, was perhaps more sincerely and less enviously regretted than that of any other man of his age. Throughout his public life his highest ambition had aimed at the production of works of literature and philosophy. In India he planned a history of England from the reign of James II., which was prosecuted from time to time, though ultimately he changed his scheme and wrote a brief but highly esteemed general survey of English history down to the reign of Elizabeth, forming 8 volumes of Lardner's Cyclopædia. Of his larger work only a fragment was posthumously published, containing an account of the revolution of 1688, which Macaulay pronounced decidedly the best history of the reign of James II. For the "Encyclopædia Britannica" he wrote an introductory "Dissertation on the Progress of Ethical Philosophy," the original outline of which his declining health obliged him to compress; and though incomplete and desultory as a whole, it abounds in indications of his peculiar comprehensiveness and justice of thought. The charms of society and of conversational discussion, and the interruptions of public affairs, combined with his constitutional indolence to keep him from continuous and severe study, and to prevent the realization of the brilliant dreams of his youth. His autobiography was abandoned almost at the beginning, and his journal is fragmentary, the long gaps being sometimes marked: *Hiatus vultu defendendus*. He was one of the most honored guests at Holland house, was an

occasional contributor to the "Edinburgh Review," and enjoyed a renown for learning, candor, and conversational brilliancy, which is justified though not adequately represented by his works. "His proper place," says Macaulay, "was his library, a circle of men of letters, or a chair of moral and political philosophy. . . . Whatever was valuable in his compositions was the ripe fruit of study and of meditation. It was the same with his conversation. In his most familiar talk there was no wildness, no inconsistency, no amusing nonsense, no exaggeration for the sake of momentary effect. His mind was a vast magazine admirably arranged; every thing was there, and every thing was in its place. His judgments on men, on sects, on books, had been often and carefully tested and weighed, and had then been committed each to its proper receptacle, in the most capacious and accurately constructed memory that any human being ever possessed." His miscellaneous works, including his contributions to the "Edinburgh Review," have been collected (8 vols., London; 1 vol., Philadelphia). The "Memoirs" of his life by his son (2 vols., London, 1835; Boston, 1853) includes also his autobiography, journal, correspondence, and many fragments and sketches.

MACKLIN, CHARLES, an Irish actor and dramatist, born in Westmeath about 1690, died in London, July 11, 1797. His real name was McLoughlin. At the age of 14 he was apprenticed to a saddler, and soon ran away from his master, and went to England, where he married the widow of a publican. This marriage was speedily dissolved on account of his youth, and Macklin, returning to Ireland, became badgeman in Trinity college, Dublin. In 1711 he again visited England, and joined a strolling company of players in the capacity of harlequin. In 1725 he made his appearance at the Lincoln's Inn theatre, London, as Alexander in "Œdipus;" and in 1741 he established his fame as an actor by his representation of Shylock at Drury Lane theatre. Retiring from the stage in 1758, he turned tavern-keeper and lecturer on oratory in Covent Garden; but this speculation having failed, he returned to the stage in 1758, where he continued with some intervals until 1789, when, in his 100th year, the failure of his powers finally compelled him to abandon it for ever. There is some doubt as to the date of his birth, he himself, to serve a special purpose, as was alleged, placing it in 1699, contrary to the evidence of his contemporaries; but even in that case he presents an extraordinary instance of professional longevity. He was the author of 10 dramas, two of which are still occasionally represented: "The Man of the World," and "Love à la Mode." A memoir of him, by J. T. Kirkman, was published in London in 1799.

MACKNIGHT, JAMES, a Scottish clergyman and author, born in Irvine, Argyleshire, in 1721, died in Edinburgh in 1800. He studied at Glasgow and Leyden, was licensed as a preacher, and in 1753 was appointed minister of Maybole in

Ayrshire, where he continued for 16 years, and composed some of his most valuable works. In 1769 he was transferred to Jedburgh, and in 1772 became pastor of one of the leading churches of Edinburgh, where the rest of his life was passed. His most important works are: "Harmony of the Four Gospels" (4to., 1756; 2d ed., 2 vols. 4to., 1768); "The Truth of the Gospel History" (4to., 1768); and "A New Translation of the Apostolical Epistles, with Commentary and Notes" (4 vols. 4to., 1795).

MAOLANE, LOUIS, an American statesman, born at Smyrna, Kent co., Del., May 28, 1786, died in Baltimore, Oct. 7, 1867. He was the son of Allen McLane, a distinguished revolutionary officer. He entered the navy at an early age and served as a midshipman under the elder Decatur. He quitted the navy in 1801 at the desire of his family, studied law, was admitted to the bar in 1808, and rose to eminence in the profession. During the war with England he served as a volunteer in a company which marched to the defence of Baltimore in 1814. In 1816 he was elected representative in congress from the state of Delaware, and was successively reelected till 1827, when he was chosen U. S. senator. In May, 1829, he was appointed by President Jackson minister to Great Britain, which post he held for two years, and on his return home was made secretary of the treasury. In 1833 he declined to sanction the removal of the deposits from the U. S. bank, and was consequently transferred by the president to the state department. He held the office of secretary of state till June, 1834, when he resigned and retired from political life. In 1837 he accepted the presidency of the Baltimore and Ohio railroad, which he held till 1847. In June, 1845, he was appointed by President Polk ambassador to London during the pendency of the Oregon negotiations, after the settlement of which he resigned. In 1850 he was a member of the convention to reform the constitution of Maryland, which was his last public service.

MAOLAREN, CHARLES, a Scottish journalist and author, born about 1785. In 1817, while holding a subaltern position in the excise, he projected the "Scotsman" newspaper, of which between 1820 and 1847 he remained the responsible editor. The journal was conducted with ability, and under his direction became the leading organ of the liberal party in Scotland. Mr. Maclaren, who is chiefly a self-educated man, possesses a considerable knowledge of geology and physical geography, is a careful statistician, and an elegant writer. He has published a "Treatise on the Topography of Troy," "The Geology of Fife and the Lothians," and is the author of a variety of scientific papers contributed to the periodicals.

MAOLLAURIN, COLIN, a Scottish mathematician, born in Kilmodan, Argyleshire, in Feb. 1698, died in Edinburgh, June 14, 1746. He was educated at the university of Glasgow, and in 1717 was appointed professor of mathematics in the Marischal college, Aberdeen, which posi-

tion he occupied until 1735, when, at the recommendation of Sir Isaac Newton, whose acquaintance he had formed during a visit to London in 1719, he was called to the mathematical chair of Edinburgh. During the rebellion of 1745 he aided with the existing government, and personally superintended the formation of trenches, batteries, and other defences hastily thrown up around Edinburgh. Upon the entrance of Charles Edward into the city he took refuge with Dr. Herring, archbishop of York, but returned to the city when quiet was restored. He died shortly afterward, having held the mathematical professorship over 20 years. His works are: *Geometriae Organica* (London, 1730); "Treatise on the Percussion of Bodies" (1734), for which he received the prize of the academy of sciences; a "Treatise on Fluxions" (3 vols. 4to., Edinburgh, 1742), written partly in reply to an attack of Bishop Berkeley on the principles of fluxions, and the most complete treatise on the subject, as well as the author's most profound work; a "Treatise on Algebra" (1748); and an "Account of Sir Isaac Newton's Philosophical Discoveries" (London, 1748), left unfinished by the author, and published from his papers. He also contributed numerous mathematical papers to the "Philosophical Transactions," on curves, equations with impossible roots, &c.

MACLAY, ARCHIBALD, D.D., an American clergyman, born in Killearn, Scotland, May 14, 1778, died in New York, May 2, 1860. His father having died, he undertook at the age of 12 the support of his mother and sisters, employing his spare time in study with a view of entering the ministry as an Independent. Having removed with his family to Glasgow, he was assisted by Mr. Robert Haldane, who offered him the means of procuring an education and a comfortable support till he should enter the ministry. In 1802 he commenced preaching at Kirkcaldy in Fifeshire. In 1804 he was appointed a missionary to the East Indies by a society in Edinburgh; but as he was about to sail, the British government interposed objections, and he was compelled to relinquish the enterprise. He then, on the advice of Mr. Haldane, sailed for New York in Oct. 1805, commenced preaching in Rose street, and soon organized a church. In 1808 he united with the Baptists, and most of his congregation in Rose street followed him. A church was organized soon after, of which he remained pastor until 1837, when he resigned, to become the general agent of the American and foreign Bible society, then just organized. He retained this agency for 18 years, visiting every part of the Union many times, and extending his journeys occasionally into the British provinces and Great Britain. The Bible translation society in England was among the results of his labors. One of his addresses was translated into several languages, and more than 100,000 copies of it circulated. In 1850 he became an officer and general agent of the Bible union, a society organized mainly for

the revision of the English Scriptures, and in 1856 was elected its president; but becoming dissatisfied with its management, he withdrew from it, and published his reasons for so doing. He continued to preach till within a few months of his death. Though an able and vigorous writer, Dr. Maclay published very little. He was esteemed a superior preacher.

MACLEAN, a central co. of Ill., drained by tributaries of the Illinois river; area, 1,182 sq. m.; pop. in 1855, 19,578. Much of the surface is prairie; the soil is very fertile. The productions in 1850 were 68,898 bushels of wheat, 1,226,533 of Indian corn, 126,159 of oats, and 49,883 lbs. of wool. There were 15 flour mills, 2 saw mills, 11 churches, and 900 pupils attending schools. The St. Louis, Alton, and Chicago, and the Illinois central railroads intersect the county, passing through the capital, Bloomington.

MACLEAN, JOHN, LL.D., an American judge and statesman, born in Morris co., N. J., March 11, 1785. Four years afterward, his father, a poor man with a large family, removed to the West, settling first at Morganstown, Va., afterward near Nicholasville, Ky., and finally in 1799 in what is now Warren co., Ohio. Here he cleared a farm, upon which he resided till his death 40 years later. His son, at the age of 18, desiring to study law, went to Cincinnati, where he maintained himself by writing in the office of the clerk of the county, while he pursued his studies under the direction of Arthur St. Clair, an eminent counsellor, the son of the revolutionary general of that name. In the spring of 1807 he was married to Miss Rebecca Edwards, and in the autumn of the same year was admitted to the bar and commenced practice at Lebanon, Warren co., O. In Oct. 1812, he was elected to represent in congress his district, which then included Cincinnati, receiving a large majority, as a democrat in favor of the war with England and a supporter of President Madison's administration. In 1814 he was unanimously reelected, receiving the vote of every voter that went to the polls. In 1815 he declined to be a candidate for the U. S. senate, though his election was certain; and in 1816, the legislature of Ohio having unanimously elected him a judge of the supreme court of the state, he resigned his seat in congress at the close of the session. He remained upon the supreme bench of Ohio till 1822, when he was appointed by President Monroe commissioner of the general land office. In July, 1823, he was appointed postmaster-general, the post office department being then in a very disordered and inefficient condition. Under his administration this branch of the public service was restored to order, and managed with a vigor, method, and economy, that soon secured an almost unexampled degree of applause and public confidence. By a nearly unanimous vote of the senate and house the postmaster-general's salary was raised from \$4,000 to \$6,000 a year. John Randolph, who voted against the increase,

said he would vote for it if the salary could be reduced to its original amount whenever Judge McLean went out of office. In 1829, having declined the war and navy departments, which were offered to him by President Jackson, Judge McLean resigned the office of postmaster-general and accepted a seat upon the bench of the supreme court of the United States, entering upon his duties as associate justice at the January term of 1830. In this capacity his charges to grand juries while on circuit are distinguished for ability and eloquence. One of the most noted of these was delivered in Dec. 1838, in regard to aiding or favoring unlawful military combinations by our citizens against any foreign government or people with whom we are at peace, with special reference to the Canadian insurrection and its American abettors. In the Dred Scott case he dissented from the decision of the court as given by Chief Justice Taney, and expressed the opinion that slavery has its origin merely in power, and is against right, and in this country is sustained only by local law. Judge McLean has long been identified with the party opposed to the extension of slavery, and his name was before the free soil convention at Buffalo in 1848 as a candidate for nomination as president. At the republican national convention at Philadelphia in 1856, he received 196 votes for the same office to 359 for Col. Fremont. At the republican convention at Chicago in 1860 he also received a number of votes.

MACLEAN, LETITIA ELIZABETH. See LANDON.

MACLENNAN, a central co. of Texas, intersected by the Brazos river; area, 800 sq. m.; pop. in 1858, 4,873, of whom 1,835 were slaves. Its surface is undulating, the river and creek bottoms well timbered, oak, cedar, and elm being abundant, and the soil of the bottoms and the prairie exceedingly fertile, producing cotton, corn, wheat, and other grain. In 1858 there were 4,404 acres planted in cotton, 10,565 in corn, and 4,883 in wheat. Aggregate taxable property in 1859, \$2,548,565. Capital, Waco.

MACLEOD, ALEXANDER, D.D., an American clergyman, born in the island of Mull, Scotland, June 12, 1774, died in New York, Feb. 17, 1838. Emigrating to the United States in 1792, he established himself in Princetown, N. Y., and, having soon after joined the Reformed Presbyterian church, entered Union college with the intention of qualifying himself for the ministry, and was graduated in 1798. In 1799 he was licensed as a preacher, and two years afterward was ordained and installed to the charge of a congregation in New York, and of one in Walkkill, Orange co., N. Y. The latter he soon after resigned; but his connection with the New York congregation, which under his ministry increased greatly in numbers and influence, terminated only with his death. He was esteemed one of the most powerful preachers of his denomination, and was widely known by his publications and sermons on religious subjects,

as well as those of public policy. He early distinguished himself by his opposition to negro slavery. His principal works are: "Negro Slavery Unjustifiable," a discourse (New York, 1802; new ed. 1860); "Ecclesiastical Catechism" (1807), of which upward of 13 editions were published; "Lectures upon the Principal Prophecies of the Revelation" (8vo., 1814); "View of the Late War" (8vo., 1815); "The Life and Power of True Godliness" (8vo., 1816); and the "American Christian Expositor" (3 vols. 8vo., 1832-'3). He also contributed largely to a variety of religious periodicals, and edited "The Large Catechism," the first book that was stereotyped in America. In 1855 appeared "Memoir of Alexander McLeod, D.D.," by Samuel B. Wiley, D.D. (8vo., New York).—**XAVIER DONALD**, an American author, son of the preceding, born in New York, Nov. 17, 1831. He was graduated at Columbia college, and after studying theology he took orders in the Episcopal church in 1845. He was settled for a short time in a rural parish, and in 1850 went to Europe, where he travelled and studied until 1852. During his residence abroad he became a Roman Catholic. After his return he devoted himself to literary pursuits, contributing to various magazines, and publishing "Pynnhurst, his Wanderings and Ways of Thinking" (New York, 1852); "Life of Sir Walter Scott" (1852); "The Bloodstone" (1853); and the "Life of Mary, Queen of Scots" (1857). Mr. McLeod is also the author of "The Elder's House, or the Three Converts;" "Château Leucure, or the Last Marquis;" and a "Life of Fernando Wood," the mayor of New York (1856). McLeod's fugitive poems are his most characteristic productions; some of them, as "The Weeder" (Putnam's Monthly) and "The Saga of Viking Torquil" (Knickerbocker Magazine) have great merit. In 1857 he removed to St. Louis, Mo., where he was for some time editorially connected with the "Leader" newspaper, then under the direction of Dr. J. V. Huntington. He subsequently became professor of rhetoric and belles-lettres at Mount St. Mary's (R. O.) college near Cincinnati, and is now (June, 1860) qualifying himself for orders in the Roman Catholic church.

MACLISE, DANIEL, R.A., a British artist, born in Cork, Jan. 25, 1811. While a boy he was placed with a banker in Cork, but at the age of 16 he forsook this occupation to devote himself to the study of painting, for which he had shown a strong predilection. In 1828 he was admitted a pupil of the antique and life schools at the royal academy, at both of which he gained prizes, and in 1830 studied for some months in the galleries of Paris. In the succeeding year he took the gold medal of the royal academy for his oil painting, the "Choice of Hercules," which was followed in 1832 by his "Allhallow Eve in Ireland," and in 1833 by another Irish subject, "The Installation of Captain Rock." Thenceforth he became a busy contributor to the annual exhibitions of the

academy, of which in 1835 he was elected an associate and in 1840 a member. Among his most popular works are: "The Play Scene in Hamlet" and "Malvolio and the Countess," both in the Vernon gallery, "The Author's Reception by the Players" and other scenes from "Gil Blas," several from the "Vicar of Wakefield," "Christmas in the Baron's Hall," "Origin of the Harp," and "The Sacrifice of Noah," painted in oil; a fresco from "Comus" in the pavilion of Buckingham palace, and others illustrating passages in English history in the new palace at Westminster. At various periods of his life he has furnished sketches for illustrated annuals and magazines, including a series of caricatures for "Fraser's Magazine," and has made designs for art manufacture. With a marked tendency to illustrate Irish history and character, he has for the most part devoted himself to chivalric and romantic subjects.

MACLURE, WILLIAM, an American geologist, born in Ayr, Scotland, in 1768, died in San Angel, near the city of Mexico, March 28, 1840. At 19 years of age he visited New York, and immediately returned to London to become a partner in the commercial house of Miller, Hart, and co., in which he rapidly acquired a fortune. In 1796 he again visited the United States, and in 1808 was in Europe as one of the commissioners to settle the claims of American citizens against France for spoiliations during the revolution in that country. While on the continent he travelled extensively, examining the geology of Europe, and collecting objects in natural history for the United States, to which he had always looked forward as his future home. On returning, he engaged with zeal in the extraordinary private undertaking of a geological survey of the whole country. Depending on his own resources and observations at a time when geology was unknown as a science, and few could appreciate his motives, he visited almost every state and territory, crossing and recrossing the Alleghenies no fewer than 60 times. In 1807 he visited New Haven, and there found Prof. Silliman, then lately from Edinburgh, whence he had brought the geological knowledge of the day acquired in the exciting discussions of the Wernerian and Huttonian controversy. His first communication to the public was a memoir entitled "Observations on the Geology of the United States, explanatory of a Geological Map," read before the American philosophical society, Jan. 20, 1809, and published in vol. vi. of their "Transactions." He still continued his explorations, and on May 16, 1817, presented another memoir to the society, which was published in their "Transactions," and also in a separate volume with a colored map and sections. The former publication was 6 years prior to that of the geological map of England prepared by William Smith, a production which gave him the title of father of English geology. To Maclure is equally due the title of father of American geology. His publications attracted much attention to the science,

and his enthusiasm was communicated to new observers. A map covering a field so vast and new, and as afterward found so complicated in its structure, could not be otherwise than rude and imperfect. It presented the general range of the secondary, transition, and primitive rocks, as they were then called, with considerable accuracy; but the tertiary groups, the arranging of which really involved an acquaintance with their fossils, were very imperfectly defined. Philadelphia was selected by Maclure for his residence when not engaged in his explorations. He joined the academy of natural sciences of Philadelphia, which was founded in Jan. 1812, and its library and museum were made the recipients of his books and specimens. On Dec. 30, 1817, he was elected president of the academy, and was reelected every year thereafter to the time of his death. The "Journal" of the academy was commenced under his auspices, and the first volume was printed in an apartment of his own house. His donations of books to the society included nearly 1,500 volumes, among which were 600 quartos and 146 folios on natural history, the fine arts, &c.—a collection such as was then possessed by no other institution in the United States. In 1816-'17 he visited the West India islands to examine the geology of the Antilles, an account of which, submitted to the society, Oct. 28, 1817, was published in vol. i. of their "Journal." In 1819 he visited France, and then went to Spain to establish a great agricultural school for the lower classes, in which labor should be combined with moral and intellectual culture. He purchased from the revolutionary government 10,000 acres of land near Alicante; but when his buildings were completed, the government was overthrown, and his property reverted to the church from which it had been confiscated. After a hazardous geological tour through the southern parts of Spain, he returned in 1824 to the United States. Here he attempted to carry out a similar plan of an agricultural school, and removed to the New Harmony settlement in Indiana, not, however, adopting the peculiar views of this community. Several distinguished naturalists from Philadelphia joined him in this enterprise, as Mr. Thomas Say, Dr. Troost, Mr. Lesueur, and a few others of scientific reputation. The scheme failed, but Mr. Maclure, having purchased largely of land in and around New Harmony, remained there several years in the hope of bringing his school into operation. The failure of his health at last caused him to seek a more genial climate; and in 1827 he embarked for Mexico with his friend Mr. Say. The next summer they returned; but Mr. Maclure, after attending the meeting of the American geological society in New Haven, Nov. 17, 1828, as the presiding officer, again embarked for Mexico, where he continued to reside, always however with the intention of returning to the United States, and with his interest in the progress of scientific education there unabated. The death of Mr. Say at New Harmony in 1834 caused

him to lose all interest there, and he gave directions for the removal of his library to the academy of natural sciences. This second donation comprised 2,259 volumes, with numerous maps and charts. The American geological society at New Haven also received from him many very valuable works and specimens. To insure a suitable building to the academy of natural sciences for the preservation of their books and collections, he contributed at different times up to 1838 the sum of \$30,000, by means of which they were enabled to complete the edifice on Broad street in Feb. 1840. At this time Maclure was seeking to return to the United States. Enfeebled in health, arrangements were made for his being borne to the coast on a litter; but his strength failing, he was obliged to return, halting first at the house of Farias, ex-president of Mexico, and next at the village of San Angel, where he died. In the early volumes of the "American Journal of Science" are many communications from Mr. Maclure. While in Mexico he wrote "Opinions on Various Subjects," devoted mainly to political economy (3 vols. 8vo., New Harmony, 1887).

MACMAHON, MARIE EDMOND PATRICK MAUMON, duke of Magenta, a French soldier, descended from an ancient and noble Irish family, born in Autun about 1807. His father was a peer of France and a personal friend of King Charles X. After having completed his education at the military school of St. Cyr, he took part in the expedition to Algiers. He afterward acted as Gen. Achard's aide-de-camp at the siege of Antwerp, and then returning to Africa, evinced much skill and courage, especially at the capture of Constantine. The province of that name and that of Oran were placed under his command in 1848. He was promoted to the rank of captain in 1833, colonel in 1845, brigadier-general in 1848, and general of division in 1852; and in 1855 he succeeded Camrobert in the Crimea, where as commander of a division of infantry he took a memorable part in the bombardment of Sebastopol, and particularly in the storming of the Malakoff, succeeding on Sept. 8 in forcing an entrance into that fort and maintaining his position there. He was rewarded by the grand cross of the legion of honor and the dignity of senator. At the outbreak of the Italian war in the spring of 1859 he was appointed commander of the 2d corps of the army of the Alps, and the victory at Magenta (June 4) was chiefly due to his exertions. Napoleon III. conferred on him on the battle field the rank of marshal of France and the title of duke of Magenta.

MACMINN, a S. E. co. of Tenn., bordered on the S. W. by the Hiwassee river and drained by its tributaries; area, 475 sq. m.; pop. in 1850, 12,906, of whom 1,568 were slaves. It has an undulating surface and fertile soil. The productions in 1850 were 939,116 bushels of Indian corn, 216,154 of oats, 56,559 of sweet potatoes, and 10,730 lbs. of tobacco. There were 25 flour mills, 20 saw mills, 7 tanneries, 87

churches, and 3,996 pupils attending schools. The E. Tennessee and Georgia railroad intersects the county, passing through the capital, Athens.

MACNAB, SIR ALAN NAPIER, a Canadian statesman, born at Niagara, Feb. 19, 1798. He is of Scottish extraction; his grandfather was a royal forester of Scotland, and his father was lieutenant of a dragoon regiment and principal aide-de-camp to Gen. Simcoe during the revolutionary war. When, during the war of 1812-'15, the Americans attacked Toronto (April 27, 1813), Alan, then a school boy, carried a musket and retreated with the British to Kingston. Shortly afterward he entered the navy as midshipman on board Sir James Yeo's ship, and accompanied the expedition to Sackett's Harbor and other American lake ports; but he soon abandoned the navy for the army, was present at the capture of Fort Niagara, and commanded the advanced guard at the battle of Plattsburg. At the close of the war he studied law, and practised in Hamilton, acting at the same time as clerk of the journals in the legislative assembly of Upper Canada. In 1829 he was elected a member of the assembly for the county of Wentworth, and after serving 8 terms was returned by the electors of Hamilton. He was subsequently chosen speaker of the lower house. During the insurrection of 1837-'8 he commanded the militia on the Niagara frontier, having the rank of colonel. He routed the insurgents near Toronto, Dec. 7, 1837, and soon afterward, a party of American sympathizers having occupied Navy island in the Niagara river, whence they were cannonading the village of Chippewa on the Canadian side, he sent a party to seize the steamer Caroline, which was employed to convey them supplies, and having driven the crew ashore set fire to it and sent it over the falls. Although the seizure was made on the American side of the river, and provoked in consequence much angry comment in the United States, the act was approved by the British government, and in the opinion of Sir Francis Head prevented an open rupture between this country and England. For his services to the crown during this insurrection Mr. Macnab was knighted, July 14, 1838. After the union of the two provinces of Canada he became speaker of the new legislature, and in 1854 was prime minister under the earl of Elgin, retaining office for a few months under his successor Sir Edmund Head. On retiring from the premiership in 1856 he was made a baronet of the United Kingdom. He has withdrawn from public life.

MACNAIRY, a S. W. co. of Tenn., drained by Forked Deer river and branches of the Big Hatchie; area, 620 sq. m.; pop in 1850, 12,864, of whom 1,893 were slaves. Its productions in 1850 were 571,080 bushels of Indian corn, 55,332 of oats, 45,472 of sweet potatoes, and 9,180 lbs. of tobacco. There were 32 grist mills, 12 saw mills, 5 tanneries, 44 churches, and 2,500 pupils attending schools. The Mobile and Ohio railroad passes through the county. Capital, Purdy.

MACNALLY, LEONARD, an Irish lawyer and dramatist, born in Dublin in 1752, died in 1820. He went to London in 1773, and while studying at the Middle Temple earned a support by writing for the stage and editing the "Public Ledger" and several magazines. After being called to the bar he attempted practice in Ireland, but poverty soon drove him back to London, where he employed the intervals of his light professional engagements by contributing to periodicals, and composing farces, comedies, and operas, which enjoyed great popularity. Though professedly a friend of the Irish patriots, it has lately been discovered that he was a government spy, to whom was owing the capture of Lord Edward Fitzgerald. He ultimately returned to Ireland, where he became one of the most distinguished members of the bar in the department of "crown law," and wrote "Rules of Evidence on Pleas from the Crown" (1808), and "The Justice of Peace of Ireland" (1808).

MACNEIL, JOHN, an American general, born in New Hampshire in 1784, died in Washington, D. C., Feb. 23, 1850. In March, 1812, he was commissioned a captain in the 11th regiment of infantry, and subsequently participated with great credit in the battle of Chippewa, the bayonet charge of the 11th regiment under his command being chiefly instrumental in securing the victory to the Americans. For his conduct in this battle, and in that of Bridgewater, where he was severely wounded, he was appointed successively brevet lieutenant-colonel and brevet colonel. He was retained in the service after the peace, and attained the rank of brevet brigadier-general and colonel of the 1st regiment of infantry. He resigned his commission in 1830. Subsequently he was for many years surveyor of the port of Boston, to which office he was appointed by President Jackson.

MACNEILL, HECTOR, a Scottish poet, born in Rosebank, on the Esk, Oct. 22, 1746, died in Edinburgh, March 15, 1818. The pecuniary circumstances of his family obliged their removal from the neighborhood of Hawthornden to a farm on the banks of Loch Lomond. There he received his early education, for a short time at a neighboring school, but chiefly under the care of his father at home. At the age of 12 he was sent for two years to Glasgow to prepare himself for a mercantile life, completed his commercial education in the counting house of a wealthy relative in Bristol, and went thence to the West Indies, whence he returned after 6 years with no gains. The small inheritance to which he succeeded on the death of his father was also lost. He therefore obtained an appointment as assistant secretary in the flag ship of Admiral Geary, which after two cruises he exchanged for a similar appointment in another ship bound to the East India station, where he remained 6 years. He afterward passed two years in retirement near Stirling, where he wrote his descriptive poem, "The Links of Forth, or a Parting Peep at the Carse of Stirling." He again visited the West Indies, was

engaged in the custom house at Kingston, Jamaica, was enfeebled by fever, and soon after returned. He published in 1788 a statement concerning the treatment of negroes, and in 1789 his poem of "The Harp," founded on a legend of the Hebrides. During a residence near the field of Bannockburn he wrote in verse the temperance tale of "Scotland's Skaith, or the History o' Will and Jean." His health was restored and a competence secured by a third residence in Jamaica, and he spent his last years in Edinburgh in affluence, publishing poems which were universally popular in Scotland. His principal later writings are: "The Pastoral or Lyric Muse of Scotland" (1808); "Town Fashions" (1810); "Bygone Times and Late Come Changes" (1811); and "The Scottish Adventurers" (1812).

MAONEVEN, WILLIAM JAMES, an Irish patriot, and subsequently professor of chemical science in the medical schools of New York, born in Ballynahowne, Galway, March 26, 1763, died July 12, 1841. He was educated in Germany, was graduated M.D. at Vienna in 1788, returned to his native country, and commenced the practice of physic in Dublin. He was diverted from his original intention by his political associations. His intimacy with Lord Edward Fitzgerald, Tone, Emmet, and Sampson, his arrest on March 12, 1798, his confinement in Kilmainham and subsequent removal to Fort George, are detailed by Dr. Madden in his second series of the "Lives of the United Irishmen." After the liberation of the prisoners of Fort George, he passed the summer and autumn of 1802 in travelling through Switzerland on foot, and wrote an account of his journey, entitled "A Ramble through Switzerland." In Oct. 1802, he entered Paris, and a few months after joined the French army as a captain in the Irish brigade. According to a letter of his friend Emmet, he had been in communication with Talleyrand, and had sought an interview with Bonaparte. He entertained the idea of an attack upon Ireland by the French, and in enrolling himself in the service of France he conceived he was only in another way devoting himself to that cause which he had espoused elsewhere. He was disappointed in his hopes, resigned his commission, and in June, 1805, set sail for New York, where he arrived on the 4th of July following. He there entered upon the practice of medicine, received from Columbia college the honorary degree of M.D., and, soon after the organization of the college of physicians and surgeons in 1807, was appointed professor of midwifery; upon its reorganization in 1811 he was made professor of chemistry, and in 1816 the department of materia medica was added to his chair. In 1826 he resigned his official connection with the regents, and with his colleagues Mott, Hosack, and Francis, aided by Godman and Griscom, organized the Rutgers college, with which he remained connected until its dissolution. He was married in 1810 to Mrs. Tom, widow of an eminent merchant. Beside his

"Rambles in Switzerland," he published "Pieces of Irish History," an "Exposition of the Atomic Theory," which was received with favor both abroad and at home, and an edition of Brande's "Chemistry;" and he was co-editor for 8 years with Dr. De Witt of the New York "Medical and Philosophical Journal." In 1812 he was appointed resident physician by Gov. Clinton, and in 1840 by Gov. Seward.

MACNISH, ROBERT, LL.D., a British physician and author, born in Glasgow, Feb. 15, 1801, died there in Jan. 1837. He studied his profession in Glasgow and Paris. While young he wrote for several Scottish magazines, and in 1825 became known as "The Modern Pythagorean" to the readers of "Blackwood," contributing under that name a series of tales and sketches which were extremely popular. His "Anatomy of Drunkenness" (1831) was one of the first works in which that vice was discussed from a purely physiological point of view. His "Philosophy of Sleep" not only attained popularity in Great Britain and America, but was, with the "Anatomy of Drunkenness," translated into French and German. In 1833 he published his "Book of Aphorisms," and in 1835 his "Introduction to Phrenology."

MACOMB, an E. co. of Mich., bordering on Lake St. Clair, and drained by Clinton river and its branches; area, 460 sq. m.; pop. in 1850, 15,530. In the E. the surface is level and well timbered, and in the W. hilly and broken; the soil is deep and fertile. The productions in 1850 were 129,808 bushels of wheat, 107,596 of Indian corn, 158,145 of oats, and 101,084 lbs. of wool. There were 8 grist mills, 8 saw mills, 5 iron foundries, 15 churches, and 4,427 pupils attending schools. Capital, Mount Clemens.

MACOMB, ALEXANDER, an American general, born in Detroit, Mich., April 3, 1782, died in Washington, D. C., June 25, 1841. He entered the U. S. army in 1799 as a cornet of cavalry, was retained in the service after the partial disbanding of the army in 1802, and at the commencement of the war with Great Britain in 1812 held the rank of lieutenant-colonel of engineers and adjutant-general of the army. Finding his position not likely to bring him into active service, he was transferred to the artillery, and in 1813, as colonel of the 3d regiment of artillery, distinguished himself at Niagara and Fort George. In Jan. 1814, he was promoted to be a brigadier-general and placed in command of that part of the northern frontier bordering on Lake Champlain. At Plattsburg on Sept. 11, 1814, being in command of about 1,500 regular troops and some detachments of militia, he sustained the attack of a greatly superior British force under Sir George Prevost, which, after the defeat of the British squadron on Lake Champlain on the same day, retreated to Canada. For his firmness and courage on this occasion, he was commissioned a major-general, and received the thanks of congress and a gold medal. He was subsequently retained in the service as colonel of engineers, and after the de-

cease of Maj. Gen. Brown in 1835 succeeded to the office of commander-in-chief of the army, which he held until his death. He wrote a "Treatise on Martial Law and Courts Martial, as practised in the United States" (8vo., 1809).

MACON, the name of counties in 6 of the United States. I. A W. co. of N. C., extending across the state and bordering on Ga. and Tenn., and intersected by the Tennessee river; area, 810 sq. m.; pop. in 1850, 6,889, of whom 549 were slaves. On the N. W. is Iron or Great Smoke mountain, and on the S. E. border the Blue Ridge. It has an elevated surface and productive soil. The productions in 1850 were 3,687 bushels of wheat, 225,879 of Indian corn, and 84,710 lbs. of tobacco. There were 20 grist mills, 2 saw mills, 8 tanneries, 9 churches, and 1,350 pupils attending schools. Capital, Franklin. II. A S. W. co. of Ga., drained by Flint river and its tributaries; area, 353 sq. m.; pop. in 1850, 8,238, of whom 4,570 were slaves. It has an undulating surface and fertile soil. The productions in 1850 were 258,864 bushels of Indian corn, 93,557 of sweet potatoes, 24,890 lbs. of rice, and 5,773 bales of cotton. There were 14 grist mills, 9 saw mills, 22 churches, and 850 pupils attending schools. Value of land in 1856, \$1,271,527. The south-western and Muscogee railroad passes through the county. Capital, Lanier. III. An E. co. of Ala., bordering on Ga., drained by branches of the Tallapoosa river; area, 970 sq. m.; pop. in 1850, 26,898, of whom 15,596 were slaves. It has an undulating surface and productive soil. The productions in 1850 were 998,867 bushels of Indian corn, 288,880 of sweet potatoes, 191,140 lbs. of rice, and 2,089 bales of cotton. There were 9 grist mills, 8 saw mills, 28 churches, and 1,842 pupils attending schools. The Montgomery and West Point railroad intersects the county. Capital, Tuskegee. IV. A N. co. of Tenn., bordering on Ky., drained by branches of the Big Barren and Cumberland rivers; area, 260 sq. m.; pop. in 1850, 6,948, of whom 766 were slaves. The surface is uneven, and the soil generally fertile. The productions in 1850 were 302,505 bushels of Indian corn, 44,865 of oats, 15,416 of sweet potatoes, and 241,268 lbs. of tobacco. There were 17 churches, and 700 pupils attending schools. Capital, Lafayette. V. A central co. of Ill., intersected by the north fork of the Sangamon river; area, 549 sq. m.; pop. in 1850, 8,865. It has a generally level surface and productive soil. The productions in 1850 were 22,226 bushels of wheat, 693,220 of Indian corn, 90,805 of oats, and 18,888 lbs. of wool. There were 5 churches, and 600 pupils attending schools. The Illinois central railroad and the great western railroad intersect the county, passing through the capital, Decatur. VI. A N. co. of Mo., drained by Chariton river and its E. fork and branches of Salt river; area, 828 sq. m.; pop. in 1850, 8,285, of whom 421 were slaves. Its surface is undulating and soil productive. The productions in 1850 were 19,181 bushels of wheat, 420,023 of Indian corn,

76,683 of oats, and 20,976 lbs. of wool. There were 6 grist mills, 6 saw mills, 7 churches, and 588 school pupils. Capital, Bloomington.

MACON, a city and the capital of Bibb co., Ga., situated at the head of steamboat navigation on both sides of the Ocmulgee river, which is here crossed by a bridge, 80 m. S. W. from Milledgeville and 190 m. W. N. W. from Savannah; pop. in 1850, 5,720; in 1860, about 8,000. It contains a great number of elegant public and private buildings, among which are the court house, market house, and 8 or 9 churches. There are 3 banks, 4 branch banks, an academy, and 5 or 6 newspaper offices. Macon is also the seat of the Georgia academy for the blind, founded by the citizens of Bibb co., and incorporated in 1852, and of the Wesleyan female college, founded in 1839, and having in 1859 10 professors, 178 students, 847 alumni, and a library of 1,600 volumes. Rose Hill cemetery, near Macon, is one of the most beautiful burial grounds in the United States. It is situated on the Ocmulgee, about $\frac{1}{2}$ m. below the city, mostly on elevated ground, the highest point being 142 feet above the bed of the river, and comprises about 50 acres. Macon is on the line of the central Georgia railroad, and is a terminus of the Macon and western and the south-western railroads. It was settled in 1838.

MACON, a town of France, capital of an *arrondissement* of its own name, in the department of *Saône-et-Loire* (Burgundy), on the left bank of the *Saône*, 275 m. by railway S. S. E. from Paris, and 43 m. N. from Lyons; pop. in 1856, 15,000. The annual value of the goods manufactured in the *arrondissement* is about \$3,000,000. They consist chiefly of clocks, watches, machinery, casks, earthenware, copperware, covers of wool, velvet, &c. Macon is the centre of a great trade in Burgundy wine. The best sorts are the growths of Thorins and Moulin à Vent, which are red, and of Pouilly, a white wine. The commerce in grain, flour, hoops, horns, and cattle is also considerable. Lamartine is a native of Macon.

MACON, NATHANIEL, an American statesman, born in Warren co., N. C., in 1757, died at his plantation in the same county, June 29, 1837. His ancestors were from Virginia, people of a high respectability and more than ordinary wealth. He was educated at Princeton, N. J., and was there at the opening of the war of the revolution. In 1777 he left college, and served for a short time as a private in a company of volunteers. Returning at the expiration of this service to North Carolina, he entered upon the study of the law, but soon enlisted again as a volunteer, and, though divers offices were urged on him, served as a common soldier under the command of his brother, Col. John Macon. He continued in the army till the provisional treaty of peace in 1783, and was present at the fall of Charleston, the rout at Camden, and during the pursuit of Greene across Carolina by Lord Cornwallis. For his military service he steadily refused any pay; nor, after that provision had

been made by the government, would he accept a pension. While yet in the army, in 1780, he was elected, in his 24th year, a member of the senate of North Carolina, in which post he continued to serve through 1785. Young as he was, he was employed on the most important committees of that body. The great questions then agitated arose from the financial difficulties of the state, and the depreciated value of the currency. It was characteristic of the man that he advocated the scheme of pledging the credit of the state to redeem her paper issues at their then depreciated rates, maintaining the injustice of allowing a set of speculators to gain what the soldiers to whom the paper had been paid must lose. But he held that the promises of the state must, at any rate, be redeemed. During this period he was married to Miss Hannah Plummer, and soon afterward settled on a plantation which he owned on the bank of the Roanoke, in Warren co., and made this spot his home for the remainder of his life. Here his main occupation and enjoyment were in the cultivation of his farm, in which he displayed singular skill and met with great success. Both in private and public he showed much of the stoic in temper, disregarding style and pleasure, studying strict economy, and holding fast his opinions, and carrying them into practice, to whatever odium or unkind remark they might expose him. When the constitution of the United States was first submitted to the vote of the people of North Carolina, he firmly opposed it as conferring too much power on the new government, as making it in effect independent of the states, and so of the people, and tending to corruption. He retained this dislike to the end of his life, and in the times of "nullification" he boasted of the accuracy of his forebodings. He was elected a member of the U. S. house of representatives in 1791, and continued in that office by successive elections till 1815, and was the speaker of the house from 1801 till 1806, when he would not be a candidate for reelection. From the lower house he was transferred in 1816 to the senate, where he served till 1828, being elected the president *pro tem.* in 1825-'7. Twice during Mr. Jefferson's administration he declined the postmaster-generalship. At the general election in 1824 the state of Virginia cast for him her 24 electoral votes for the vice-presidency of the United States. In 1828 he resigned his seat in the senate, and all the other public offices which he held, as trustee of the university of North Carolina, justice of the peace, &c. At that time he had been a member of congress for 37 successive years, a longer term of continuous service than has fallen to the lot of any other legislator in our country. It was then his purpose to withdraw finally from every form of public function. Yet in 1835 he presided over the convention that was called to revise the constitution of North Carolina, and rendered his last political service to the country as a member of the electoral college of that state in 1836.—Mr. Macon was always a

firm and consistent democrat. He had an unlimited confidence in the capacity of the people for self-government. A favorite saying of his was, that "if let alone they would always do what was right." He was therefore what in later times has been called a strict constructionist. He was disposed to hold the federal government and all state authorities within the narrowest limits of the powers granted to them; and used to insist on a complete responsibility to the people by a frequent return of all trusts to them. He voted for the embargo, and for the declaration of war against Great Britain, but withstood many of the schemes of the administration for carrying it on. He held that the war should be defensive only, and so refused to enlarge the naval force beyond what was needed to guard the coast, voted against a system of fortifications, against privateering, &c. He also voted against all schemes of internal improvement to be undertaken by congress, spoke in 1795 against a grant to the count De Grasse, and in 1824 against a grant of lands to Gen. Lafayette for revolutionary services. In the convention of North Carolina he spoke against giving to free negroes the right to vote; against a land qualification of voters; against the state engaging in any works of internal improvement; against all religious tests as a condition of holding office; in favor of annual instead of biennial sessions of the general assembly; and in favor of voting *viva voce* at all elections. As a speaker, while he was in no sense an orator, few were really more effective. His longest speeches occupied hardly more than half an hour. Few men in congress were listened to with more respectful attention. Two sentences were enough to express his thanks for an election to the chair of the house of representatives, and seven words to announce to his constituents that war had been declared against Great Britain. It is hardly to be wondered at that a character so self-reliant, and with so many salient points, should have retained the public confidence so long; that Mr. Jefferson called him "the last of the Romans;" and that Mr. Randolph pronounced him "the wisest man he ever knew." He died after only a few hours' illness, but had already given directions to a neighbor to make for him a plain coffin, to be paid for before his interment, had selected for the place of his burial a barren ridge, where the plough could never come, and ordered the spot to be marked only by a pile of loose stones from the field. Mr. Macon was a student of few books beside the Bible, and was a member of the Baptist church. A sketch of his life, by Edward R. Otton, was published at Baltimore in 1840.

MAONNAIS, an ancient territory in Burgundy, now comprised in the department of Saône-et-Loire. It was inhabited by the Ædui, conquered by Julius Cæsar, and in the 5th century by the Burgundians. Afterward it was united to the empire of Charlemagne, and at the end of the 9th century to the kingdom of

Arles. It became a hereditary county in the 10th century, and was purchased by Louis IX. in the early part of the 18th. The duke of Berry came into possession of it in the middle of the 14th century. It was restored to the crown in 1416; 19 years afterward Charles VII. gave it to Philip the Good, duke of Burgundy; and it was finally reunited to the French crown in 1477. Its capital, MAÇON, has been the seat of a bishopric since the 5th century.

MACOUPIN, a S. W. co. of Ill., drained by Macoupin, Otter, and Cahokia creeks; area, 864 sq. m.; pop. in 1855, 17,827. It has a diversified surface and excellent soil. The productions in 1850 were 77,022 bushels of wheat, 1,598,829 of Indian corn, 257,101 of oats, and 22,851 lbs. of wool. There were 20 grist mills, 10 saw mills, 2 tanneries, 20 churches, and 2,008 pupils attending schools. The Terre Haute, Alton, and St. Louis, and the St. Louis, Alton, and Chicago railroads intersect the county, the latter passing through the capital, Carlinville.

MACPHERSON, JAMES, a Scottish author, born in Ruthven, Inverness-shire, in 1788, died at his seat of Belleville, Feb. 17, 1796. He completed his education at the university of Aberdeen, and probably afterward studied for the ministry, although it is not certainly known that he ever took orders. At the university he gave evidences of a considerable taste for poetry, and in his 20th year ventured upon the publication of a poem in 6 cantos entitled the "Highlander," which excited no attention. Subsequently, while a private tutor in the family of Mr. Graham of Balgowan, he was encouraged by Home, the author of "Douglas," and Dr. Hugh Blair, to whom he had shown the work, to publish a small volume entitled "Fragments of Ancient Poetry collected in the Highlands of Scotland," and purporting to be a translation of genuine remains of ancient Celtic poetry. The enthusiasm and delight with which these "Fragments" were received were universal; men of letters, like Dr. Blair, Hume, and Dr. Robertson, expressed the highest opinion of their value; and a subscription was immediately raised to enable the author to undertake a mission to the highlands and secure such remaining specimens of Celtic poetry as, it was intimated, might yet be recovered. Macpherson accordingly made an extensive tour through the mainland and islands inhabited by the Gaelic race, and published in 1762, as the first result of his explorations, "Fingal, an ancient Epic Poem in 6 Books; together with several other Poems composed by Ossian, the son of Fingal, translated from the Gaelic" (4to.), which was succeeded in the following year by "Temora, in 8 Books, with other Poems by Ossian." The reception of the first of these works was flattering in the extreme, and not only was it read with avidity in Great Britain, but speedily translated into the principal European languages, the author being alluded to in each instance in terms that, as he has himself expressed it, "might flatter

the vanity of one fond of fame." With the publication of "Temora," however, a change began to take place in public opinion, and gradually a party, small at first, but soon formidable in numbers and influence, sprung up, which did not hesitate to question the authenticity of the alleged translations. Macpherson, elated by prosperity and fame, affected to treat such doubts with contempt, and assumed a bearing so arrogant that Hume, who in 1760 had spoken of him as "a modest, sensible young man," declared 8 years later that he "had scarce ever known a man more perverse and unamiable." In 1764 he received the appointment of secretary to Gov. Johnstone of Pensacola; but after spending a short time in that colony and visiting other parts of North America, he returned in 1766 to England, and fixed his residence in London. In 1771 he produced a work entitled "An Introduction to the History of Great Britain" (4to.), composed, as he said, merely for private amusement, but which was attacked from many quarters with a severity little calculated to improve the author's irritable temper. Shortly afterward he still further endangered his literary reputation by a prose translation of the *Iliad* (1773), which was almost universally condemned as beneath criticism. So greatly was his prestige shaken by this publication, that Dr. Johnson, in reply to an abusive letter from Macpherson on the subject of the authenticity of the Ossianic poems, humiliated his adversary, by telling him: "Your abilities since your Homer are not so formidable." In 1775 he produced his "History of Great Britain from the Restoration to the Accession of the House of Hanover" (2 vols. 4to.), written in the tory interest to detract from the integrity and patriotism of the men who had brought about the revolution of 1688, for the copyright of which he received £3,000; and about the same time he employed his pen in the service of the government, producing the "Rights of Great Britain asserted against the Claims of the Colonies" (1776), and "A Short History of the Opposition during the Last Session of Parliament" (1779), both of which went through several editions, the latter work being generally attributed to Gibbon. In reward for his services he was appointed agent to the nabob of Arcot, and was returned a member of parliament for Camelford, which he represented for upward of 10 years. His legislative career was not remarkable, and he never attempted to address the house. Compelled by failing health to withdraw from public life, he built a handsome seat at Belleville in his native Inverness-shire, whither he retired a few years before his death. His remaining works relate principally to Indian affairs. At his own request he was buried in Westminster abbey, the expense of erecting his monument being defrayed by himself.—The controversy respecting the authenticity of the alleged translations from the poems of Ossian, though of comparatively little interest to the present generation, was one of the most important in Eng-

lish literary history, as well on account of the eminence of those who participated in it, as of the activity and bitterness with which it was waged. Various shades of opinion, from utter disbelief in the Ossianic poems to enthusiastic adoption of every word they contained, characterized the arguments of the controversialists, the two extremes being represented by Dr. Johnson, Malcolm Laing, and a few others on the one side, and by Drs. Blair and Gregory, Lord Kames, Sir John Sinclair, and Mr. Alexander Macdonald on the other. Others again, like Dr. Graham of Aberfoyle, believed that the poems were to a certain extent authentic, the remainder being interpolations; while a fourth party, including David Hume and Dr. Smith of Campbelltown, entertained strong doubts of their authenticity, but hesitated to declare them entirely spurious. During the progress of the controversy, which commenced in 1763 and substantially terminated early in the present century, Macpherson maintained an obstinate silence, making no effort to rebut the charge of literary forgery brought against him, refusing to afford proofs of the authenticity of his translations, and affecting only indignation, that his veracity should be called in question. When urged by the highland society of London (which, after a careful inquiry into the whole subject, had reported that no single poem, "the same in title and tenor with the poems published," could be discovered in all Scotland) to publish the originals of his Ossianic poems, he promised to employ his leisure time in arranging and printing them. At the time of his death, nevertheless, which occurred 33 years subsequent to the appearance of "Temora," they were not ready for the press, and only in 1806 were given to the world by Sir John Sinclair. But as the manuscripts were all in the handwriting of Macpherson or of his amanuenses, the proof of their authenticity was justly believed to have been in no degree advanced; and it has been suggested, and pretty generally believed, that whatever may have been the source from which the English versions of Ossian were derived, the so called "originals" were translated from them into Gaelic by Macpherson himself or by other persons in his employ; hence the delay in their publication. It was the opinion of Sir James Mackintosh that Macpherson originally had no serious intention of maintaining the authenticity of the Ossianic poems, but intended at some time to claim them as his own. "If he had such a design," says Sir James, "considerable obstacles to its execution arose around him. He was loaded with so much praise that he seemed bound in honor to his admirers not to desert them. The support of his own country appeared to render adherence to those poems, which Scotland inconsiderately sanctioned, a sort of national obligation. Exasperated, on the other hand, by the perhaps unduly vehement and sometimes very coarse attacks made upon him, he was unwilling to surrender to such opponents. He involved him-

self at last so deeply as to leave him no decent retreat." The poems themselves, which, notwithstanding their false imagery, the perpetual recurrence of the same ideas, the verbiage and bombast with which they abound, contain passages conceived with true feeling and power, have fallen into almost total neglect; and the present generation of readers, judging of them by their intrinsic value, are led to wonder that they should have formed the subject of any serious controversy.

MACRAUCHENIA (Owen), a genus of fossil herbivorous animals, forming one of the connecting links between the palæotherium and other extinct pachyderms of the Paris basin and the camel family, especially its American representatives. This genus was established in 1888 by Prof. Owen on some vertebrae and bones of extremities obtained by Mr. Charles Darwin in Patagonia, from an irregular bed of pale reddish earth and sand, evidently of subaqueous origin, overlying the porphyritic gravel at St. Julian, in lat. 49° 14' S.; the gravel bed itself was over the pumiceous strata, and argillaceous beds of the upper tertiary formation. The bones were found in a deep furrow in the upper tertiary filled with the earthy deposit, evidently but recently elevated above the sea; indicating that this animal lived after the gravel was spread over this plain, and long after the existence of recent shells, which, according to Darwin, are among the most common now living on the coast. The *M. Patagonica* (Owen) was as large as the present hippopotamus and rhinoceros. The cervical vertebrae were very much like those of the llama, forming a long and slender neck, bearing probably a comparatively small head without a proboscis; as in the llama, these have no canal for the vertebral artery in their transverse processes, this vessel passing for a considerable part of its course in the spinal canal itself; their form is also elongated, with a slight anterior convexity and posterior concavity on their articulating surfaces, indicating a less freedom of motion in the neck. The lumbar vertebrae, though 7 in number as in the llama, in their form and the structure of their articulating surfaces resemble those of pachyderms, and indicate a slight concavity in the region of the loins. The union of the radius to the ulna, and of the fibula to the tibia, approximates it to the ruminants; but the feet resemble those of pachyderms (like the tapir) in having separated metacarpals, and 3 almost equal fingers terminating each in a small rounded hoof. According to Pictet, the molar teeth resemble those of the palæotherium, the last lower one having no 3d lobe, and the premolars being more simple. For details see Owen's description of the fossil mammals in the "Zoology of the Voyage of the Beagle" (1840).

MACREADY, WILLIAM CHARLES, an English actor, born in London, March 3, 1793. His father, the lessee and manager of several provincial theatres, having designed him for one of the learned professions, he was placed at 10

years of age at Rugby school, where he attained considerable reputation as a classical scholar. About 1810 the elder Macready became so seriously embarrassed in his pecuniary affairs, that his son, who was preparing to proceed to Oxford, was induced to resign all idea of completing his education, and as a means of support to go upon the stage. He made his début at the Birmingham theatre in June of that year as Romeo, and by industry and careful study soon acquired a respectable position upon the provincial boards. Gradually rising in his profession, he made his first appearance before a London audience at Covent Garden theatre, Sept. 16, 1816, as Orestes in Phillips's tragedy of the "Distressed Mother," and was pronounced by Hazlitt "by far the best actor that had come out in his remembrance, with the exception of Mr. Kean." From that time forward he continued, notwithstanding the presence of such great actors as Kemble and Kean upon the stage, to rise steadily in the public estimation, until he was generally recognized as the first of English tragedians. Among his most successful personations aside from the Shakespearian plays were Virginius, Caius Gracchus, and William Tell in Knowles's dramas, Melantius in the "Bridal," Rob Roy, Gambia, Werner, Pierre, Richelieu, &c. As a delineator of Shakspeare's heroes he has attempted a wide range of characters, but has been most successful in Hamlet, Macbeth, Othello, Coriolanus, and Leontes. In 1826 he made a successful tour through the United States, and in 1828 visited Paris, where he was received with greater favor than had been accorded to Kean or Kemble, and by some French critics was pronounced second only to Talma. In 1837 he undertook the management of Covent Garden theatre, but retired at the end of the second season, and for two seasons commencing with 1842 he had charge of Drury Lane. As a manager he did much to elevate the standard of dramatic representations, and to relieve the theatre of the reputation for immorality and profligacy with which in the opinion of many it was identified. The performances were artistic and appropriate, and in matters of costume, scenery, and the various accessories, in advance of those familiar to English theatres. The enterprise nevertheless was pecuniarily unsuccessful in both instances; and in retiring from the management of Drury Lane, Mr. Macready stated that his actual loss during his connection with that theatre amounted to £8,000. In 1843-'4 he again played a series of engagements in the United States, which he revisited for the last time in 1848, previous to taking his farewell of the stage. In consequence of a misunderstanding of some years' existence between Mr. Edwin Forrest and himself, the friends of the former actor threatened to prevent the appearance of Mr. Macready in New York. He nevertheless played for a number of nights at the Astor Place opera house in that city in Oct. 1848; but upon commencing a farewell engagement there in the succeeding May he was menaced by se-

rious opposition. On Monday, May 7, when he appeared as Macbeth, such was the confusion prevailing in all parts of the house that the manager was obliged to order the curtain to fall before the termination of the performance. Mr. Macready was thereupon inclined to resign his engagement; but upon the publication in the newspapers of a card signed by many citizens, requesting him to remain, and promising to protect him in the discharge of his professional duties, he consented to reappear on the following Thursday. On that evening, owing to the precautions taken to preserve order in the house, he succeeded in performing his part, Macbeth, and at the end of the play was called out by the audience, whom he thanked for their protection and support. Outside of the theatre the friends of Forrest, after vainly endeavoring to effect an entrance, commenced an attack upon the building with stones and other missiles. The police being unable to restrain the mob, which was rapidly increasing in numbers and violence, and the reading of the riot act by order of the mayor proving ineffectual, the military were called out, and after several volleys of musketry, by which 23 persons were killed and 36 wounded, the riot was quelled. Though assured of ample protection, Mr. Macready determined to make no further attempt to act in New York, and soon after left the country. In 1850-'51 he performed a series of farewell engagements in England, and on Feb. 26, 1851, took a formal leave of the stage at Drury Lane theatre. On March 1 a complimentary dinner was given to him in London, which was attended by many men eminent in literature and art, and at which the chairman, Sir E. Bulwer Lytton, pronounced a high eulogium upon Mr. Macready as an actor, a manager, and a man. His rank as an actor is due principally to intelligent study, his genius being the reverse of impulsive, and his imagination not of that plastic nature which can instantly seize and embody impressions. Many excellent plays of Bulwer, Talfourd, Knowles, Browning, Marston, White, Taylor, and others, were brought out under his auspices; and his exertions to elevate his art and to depress whatever vicious tendencies may be connected with it have had a beneficial effect.

MACRINUS, Roman emperor from April, A. D. 217, to June, 218, born in Cæsarea, Mauritania, in 164. Of the humblest parentage, he was admitted into the employment of Plautianus, the favorite of Septimius Severus, and received successive appointments in the imperial household, until he became prefect of the prætorians under Caracalla. On the death of the latter, whose assassination he plotted, he was proclaimed emperor, gaining the favor of the prætorians by a liberal donative and of the senate by repealing some obnoxious taxes. He immediately marched against the Parthians under Artabanus, and was signally defeated by them near Nisibis. His enforcement of discipline caused disaffection among his troops, a portion of whom renounced their allegiance to

him in favor of the pretender Elagabalus. He marched against the latter, was defeated at Antioch, fled in disguise to Chalcedon, was quickly betrayed, and was put to death in Cappadocia.

MACROBIUS, **AMBROSIVS AURELIUS THEODOSIVS**, a Latin author, who lived in the early part of the 5th century of the Christian era. The place of his nativity is unknown, but the Hellenisms pervading his style indicate that he was a Greek. He wrote on history, mythology, criticism, physics, and metaphysics. One of the principal editions of Macrobius is that of Gronovius (Leyden, 1670).

MACTYEIRE, **HOLLAND NICHOLS, D.D.**, an American clergyman, born in Barnwell district, S. C., July 28, 1824. He was graduated at Randolph Macon college, Va., in 1844, and was then appointed professor of ancient languages and mathematics in that institution. After a year he entered the Virginia conference of the Methodist Episcopal church South, and was stationed at Williamsburg, Va., whence he was transferred in 1856 to Mobile, Ala. He preached in New Orleans for two years (1849-'51), at the expiration of which time he was called to the editorial chair of the New Orleans "Christian Advocate." In 1858 he was elected by the general conference editor of the central paper of the Methodist church South, the "Christian Advocate," at Nashville. He is the author of a prize essay on the "Duties of Christian Masters," which was published by the southern Baptist publication board, and which he subsequently revised and enlarged for the Methodist publishing house. He received the degree of D.D. in 1858 from the Wesleyan university, Ala., and from Emory college, Ga., the same year.

MACVICKAR, JOHN, D.D., an American clergyman and author, born in New York in 1787. He was graduated at Columbia college, N. Y., in 1804, and after spending some time in Cambridge, England, was ordained a clergyman of the Protestant Episcopal church, and in 1811 was settled over a parish in Hyde Park, N. Y. In 1817 he was appointed professor of moral philosophy, rhetoric, and belles-lettres in Columbia college, which position he still (1860) holds. He is the author of "A Domestic Narrative of the Life of Samuel Bard" (1822); "Outlines of Political Economy" (1825); "Early Years" (1834), a memoir of Bishop Hobart; "The Professional Years of Bishop Hobart" (1836); and of numerous essays, addresses, and occasional publications.

MACWHORTER, ALEXANDER, D.D., an American Presbyterian clergyman, born in New Castle co., Del., July 15, 1784, died in Newark, N. J., July 20, 1807. In 1796 he entered the junior class in the college of New Jersey, then at Newark, but removed the next year to Princeton. He began the study of theology immediately after graduating, was licensed to preach by the presbytery of New Brunswick in 1798, and in the following year was installed pastor of the church in Newark, which office he retained with some interrup-

was for nearly half a century. In 1764 he was appointed by the synod of New York and Philadelphia to a mission in North Carolina, where his friends were settled, and where he had spent some years of his youth; he remained there about a year, and after visiting Boston returned to Newark in 1766. In 1775 he was appointed by congress to visit the western counties of North Carolina to persuade the numerous royalists there to adopt the patriot cause. Near the close of 1776 he hastened to the army camped on the Pennsylvania shore, opposite Trenton, to consult concerning the protection of New Jersey, and was present at the council of war which advised the passage of the Delaware and the surprise of the Hessians. At the invitation of Gen. Knox in 1778 he accepted the chaplaincy of his artillery brigade, and enjoyed friendly relations with Washington during the few months that he held this office. In 1779 he accepted a pastorate and the presidency of Charlotte academy, in Mecklenburg co., N. C.; but the place being captured by Cornwallis, he lost his library and furniture, and, fearing further attacks, was recalled and reinstalled at Newark. In 1788 he was prominent in settling the confusion of faith and forming the constitution of the Presbyterian church of the United States. Dr. McWhorter was for 35 years a trustee of the college of New Jersey; and after the burning of the college buildings in 1802, the collection of funds for a new edifice was chiefly due to his influence and personal solicitations in New England. In 1800 he published a century sermon, describing the settlement and progress of the town of Newark, and in 1803 a collection of sermons in 2 vols. 8vo.

MADAGASCAR, the largest and most important of the African islands, situated in the Indian ocean, between lat. 12° and 25° 40' S. and long. 43° 10' and 50° 30' E., separated from Africa by the Mozambique channel, which is in its narrowest part about 300 m. broad; length of the island, from Cape Amber in the N. to Cape St. Mary's in the S., 337 m.; average breadth 250 m., greatest breadth (in the centre) about 350 m.; area estimated at 240,000 sq. m.; pop. about 3,000,000. The name Madagascar seems to be of foreign origin, the natives having no distinct appellation for the whole island. The sea coast contains many excellent harbors, among which are Diego Suarez bay or British cove, near the N. E. end of the island, and Port Louis, Antongil bay, and St. Luce bay, on the E. coast. Tamatave and Foulle Pointe are, however, the most frequented ports on the E. coast, as they are only open roadsteads protected from the surf by coral reefs. On the W. coast are St. Augustine's bay, Tofoa bay, Boiana, Sambatoka, Majamba, Naranda, Pseudava, and Champaykea. Of these, St. Augustine's and Sambatoka are the most frequented. Close to the N. shores of Madagascar are several small islands, the chief of which are St. Mary's, 31 m. long and 3 broad, on the E. coast, and Nosibé, which is somewhat larger, on the N. W. coast.

Both of these are occupied by the French. The N. coast of Madagascar and some parts of the S. E. coast are lofty and precipitous; but generally the shore is a low plain, varying in width inland from 10 to 100 m., the breadth being greatest on the W. side. Beyond this plain the country rises gradually, till in the interior the table-lands reach an elevation of 6,000 feet above the sea. There are several great mountain ranges running from N. to S., the highest peak of which, Ankaratra, is computed to be 12,000 feet above the sea. The island abounds in rivers, some of which are between 100 and 200 m. in length. The largest are the Ikiopa, Manisitra, Matetamana, Mangoro, Sambaho, and Betsibooka, most of which discharge on the W. coast. The Sambaho and Betsibooka are said to be navigable for boats 150 m. from the sea. The mouths of most of the rivers, however, are obstructed by sand bars, and they are little used for navigation. Along the E. coast is a series of extensive lakes, which at intervals communicate with the sea. Some of these are 100 m. in length. The principal are Sariviaka, Imania, Imangora, and Itasy. Springs are numerous in the interior of the island, and many of them are medicinal. There are warm springs and salt springs, of which however, from superstitious prejudices, no use is made.—The climate of Madagascar is exceedingly diversified, both in regard to temperature and to salubrity. In the low lands and on the coast the heat is intense; but in the elevated interior the mercury seldom rises above 85°, and on the mountain summits ice is sometimes formed. The coast region with few exceptions is extremely unhealthy, and affects with equal injury the natives of the interior as well as Europeans. The rank luxuriance of the vegetation and the abundance of stagnant water produce a miasma, exposure to which causes a deadly fever. The highlands of the interior are exempt from this scourge, and are remarkably healthy. Of the geology of the island few details are known. The hills between the E. coast and the interior seem to consist of primary rocks; gneiss, granite, and quartz are found, and also basalt and large beds of clay. In other parts slate and limestone have been seen. Excellent iron abounds in the interior, where one of the elevations is called by a name signifying "iron mountain." Coal is found in the northern parts, and copper and other metals are said to exist, but of this nothing is known with certainty. A great part of the island is covered with dense forests, abounding with valuable timber suitable for ship building, carpentry, and cabinet work. Among the trees are ebony and a species of mahogany. The botany of the island is exceedingly rich, and is yet mostly unexplored. Among the plants peculiar to it is the "traveller's tree," so called because at all seasons its trunk, when an incision is made, yields a cool, sweet, and wholesome beverage. Its wood is also used in the construction of dwellings, and for many domestic purposes. Other valuable trees are the ravine-

la, the fotibe, the filso, the baobab, which abounds on the W. coast; the ampaly, whose hard leaf is used to polish wooden ware; the avoha, from which coarse paper is made; the *tapia edulia*, on which a native silkworm is extensively reared; the tamarind, the aviavy and other species of fig, the vakoa, the dragon-tree, and the bamboo. The azaina is used for canoes, which are made by scooping out the trunk; it yields a great quantity of yellow juice, very adhesive, and used by the natives as glue. The voahena, which furnishes gum elastic, is abundant. Madagascar produces rice, which is the principal food of the people, tobacco, sugar, cotton, indigo, and various spices; also cocoa nuts, breadfruit, plantains, bananas, yams, pine-apples, peaches, oranges, and a great variety of tropical and temperate fruits. The potato is extensively cultivated, and the coffee plant has been introduced and thrives well. Domestic poultry of all kinds is reared in profusion. It is said that in the wildest part of the island a peculiar species of bird of enormous size exists, which is supposed to have given rise to the story of the fabulous roc of the Arabian romances. Oattle, both wild and tame, are numerous, and there are a few sheep and pigs in some districts. In the forests are wild hogs, wild dogs and cats, baboons, monkeys, foxes, and squirrels. There is also a remarkable animal peculiar to the island, called the aye-aye. It is a species of lemur, and is described as having large and round eyes, thin and broad ears, and a thick bushy tail. Its color is brown, and it is nocturnal in its habits. It is very rare, and the natives regard it with a sort of superstitious feeling. The rivers of Madagascar swarm with crocodiles, which are sometimes found 20 feet in length. They are fierce and dangerous, and destroy many cattle, and sometimes even men. The natives regard them with veneration, and never dare to injure them even in self-defence. Serpents of great size are found, though few are venomous.—Madagascar forms one kingdom, and is divided into 23 provinces, which were formerly independent states. Of these provinces the principal are Vohimarina in the extreme north; Tamatave and Betanimena on the E. coast; Matetanana on the S. E., settled in part by Arabs, and famous for its diviners and magicians; Anosy in the extreme S. E., fertile and populous, and the site of the most extensive French settlements; Betsileo in the interior, the people of which are noted for the mildness and simplicity of their manners; Menabe on the W. coast, inhabited by a race called Sakalavas; and Ankova, the central and most important province, the seat of government and the native country of the Hovas, the dominant people of the island. Ankova contains Tananarivo, the capital of Madagascar and the only considerable town, with a population of about 25,000. The Madagascans, or Malagashes or Malagasy, as they are generally termed, are not of one race, but are evidently derived from a variety of stocks. The two great divisions of the people

are into black and olive. The olive race is distinguished by a light, exquisitely formed person, fair complexion, and straight or curling hair; while the black race is of more robust form, and has woolly hair. Beside these two great ethnological divisions, the population of the island is distinguished into 4 great political or geographical sections; these are the Hovas, the Sakalavas, the Betsileos, and the Betanimenas. The Hovas have within half a century made themselves masters of the whole island. In person, they are generally below the middle stature; their complexion is a light olive; their features rather flat than prominent; their lips occasionally thick and projecting, but often thin as in the Caucasian race; their hair is black, but soft, fine, and straight or curling; their eyes are hazel, and their figures erect and well proportioned. They are remarkably active, but have less bodily strength than the black tribes. The Sakalava during the last century were the dominant nation, and held the Hovas in subjection. Physically they are considered the finest race in Madagascar. They are tall and robust, and their limbs well formed, muscular, and strong. Their features are regular, their eyes dark, and their hair black, shining, and crisped or curly. Their complexion is blacker than that of any other people in the island. In war they are bold, energetic, and resolute; in peace they are indolent, and much addicted to sorcery and other superstitious practices. They are friendly to Europeans, evince a strong desire for improvement, and are said to exhibit ample proofs of mental powers capable under proper culture of the highest attainments. They are more numerous than the Hovas, and occupy the N. and W. coasts. The Betsileos are low in stature, slender in figure, erect and nimble in their movements. Their color is dark, though some are of light copper complexion. Their lips are thick, their eyes hazel, and their hair black, long, and curling. They are a modest and unassuming people, inferior to the Hovas in energy and enterprise, but peaceful and laborious cultivators of the soil. The Betanimenas are taller than the Betsileos, and are next to the Hovas the fairest people in the island. Their hair, though not always black, is generally frizzly. They are peculiarly distinguished for cleanliness in their houses and apparel, but are reputed to be of lower morals than any other portion of the people. On the E. coast a small part of the population is descended from the Arabs, who for centuries have traded to Madagascar. The Rev. William Ellis, whose works contain the fullest accounts of Madagascar, remarks of the people: "Their mental faculties, though in the majority of cases deteriorated by sensuality, enfeebled and cramped in their exercise by the juggleries of divination and sorcery and the absurdities of superstition, are yet such as to warrant the conclusion that they are not inferior to other portions of the human race; that if liberated from the debasing trammels by which they are now confined, and favored

with enlightened and generous culture, they are capable of high mental excellence. Among the dark-colored race the Sakalavas manifest the greatest intellectual vigor, uniting a remarkable quickness of perception with soundness of judgment. . . . With less that is sprightly and prepossessing in manners and address, the dark-colored tribes possess more that is commendable and amiable in social life; and there are among them more straightforwardness and honesty than in the fairer races. The latter, with the exception of the Betsileo, exhibit, with but few traits of character that can be regarded with complacency, much that is offensive to every feeling of purity and every principle of virtue. They are often, probably under the influence of superstition and revenge, coolly and deliberately cruel toward the vanquished in war; they appear to be naturally vain, self-complacent, and indolent, unless when roused to effort by ambition, avarice, revenge, or lust; ambition and a love of domination appear inherent." They are said, however, to be faithful in their friendships, and toward strangers they exercise a prompt and cheerful hospitality. Among neighbors a remarkable degree of kindness is shown by lending money or property, and by assisting those who are in distress. Duplicity is a general trait of character, and lying is not regarded as a vice at all. In fact, a serious and public complaint was once made against the preaching of Christianity on the ground that it taught the people to scruple at telling lies even to deceive their country's enemies. Infanticide is practised to a considerable extent, the victims being chiefly those who are born at hours and on days pronounced unlucky by the astrologers. Polygamy is permitted, limited only by the restriction that no man may take 12 wives excepting the king. There is also an almost unlimited facility of divorce on the part of the husband. Circumcision is practised, but rather as a political than a religious ceremony, being regarded in some respects as an initiation into the rank, privileges, and obligations of manhood and citizenship, and in some sense as a transfer of the subjects from the jurisdiction of the parent to that of the king. The rite is performed on a large number of boys at once by order of the sovereign, and at a time fixed by him. Slavery has existed in Madagascar from a very early period. Captives taken in battle and tribes conquered in war were reduced to bondage, and their descendants generally still remain in that state. Free persons also sometimes become slaves by their own act, by selling themselves for a subsistence, when reduced to absolute poverty. A father may also sell his children into slavery in certain cases. Many are made slaves by the sentence of the judges or the edict of the sovereign. Slavery is considered the heaviest penalty of the law next to capital punishment. It is always attended with confiscation of property, and involves the wives and children of the person on whom it is inflicted. Some of the nobles

have many hundred slaves. The master has absolute power, except that death can only be inflicted by order of the king. Between the slaves and the freemen there is an intermediate class, composed chiefly of those who labor for the government, especially those employed in felling timber or in burning charcoal. In one of the great forests near the capital, the woodcutters, called the "twelve hundred," though their number is really 2,000, are employed through life in felling and preparing for building or other purposes timber for the government. They build their huts and rear their families in the recesses of the forest, and cultivate enough land to yield them a scanty subsistence. Their male children are regarded as woodcutters from their birth, and labor at their vocation without any pay whatever; and were any of them to abandon their occupation, they would be pursued and treated as criminals or deserters. The smiths or general workers in iron, the gunsmiths and spear makers, carpenters, tailors, and in short all other workmen employed by the king, are expected to labor for life without wages, and to provide for the support of themselves and their families. There is a class inhabiting the eastern districts, the Bezanozano, who are required to carry all merchandise or other goods for the sovereign from the coast to the capital, a distance of 300 miles, without pay.—The Madagascans are generally remarkably hospitable. Whenever a stranger in the course of his journey enters a village, a present is brought him of rice, poultry, and fruit, or whatever other refreshment the place affords. If he approaches a house and the owners are within, he is cordially invited to enter, and treated with the utmost attention and civility. Vegetables of all kinds are abundant, and cattle and poultry are exceedingly plentiful and cheap. Locusts, of which large swarms appear in the spring and summer, form an important article of food. They are gathered in baskets by the women and children, and after the legs and wings have been picked off they are partially boiled, dried in the sun, packed in baskets, and carried to market. An equally singular article of food is the silkworm in its chrysalis state, which is cooked and eaten in some provinces. But the most important and general article of support is rice, which is native to the island. To eat rice, in Madagascar, signifies to take a meal. Next to rice, the most valuable kinds of food are the maize, the manioc, arrow root, and several varieties of yam, together with a number of European vegetables which have been recently introduced. The people eat with their fingers, and wash their hands and clean their teeth carefully after each meal. They are temperate in drinking, and water is almost the universal beverage, though a distilled spirit called *toaka* is occasionally used as a luxury. Ardent spirits are prohibited at the capital, and drunkenness is almost unknown except at the seaports frequented by Europeans. Tobacco is extensively cultivated, but is not smoked; it is mixed with other herbs and made

into snuff, which is taken, not into the nose, but into the mouth. The *rongona* or native hemp is smoked in pipes made of reeds. The favorite amusements of the Madagascans are fishing, hunting wild cattle, bull-baiting, cock fighting, and a game called *katra* somewhat resembling draughts. The people are extremely fond of music, both vocal and instrumental, though they have not yet made much progress in either. They have, beside the drum, two native instruments of music, the *valiha* and the *lokanga*. The former is a bamboo having 8 small slips cut from its rind between two of its joints, and then by means of small pieces of wood, used as bridges in a violin, elevated about a quarter of an inch. The player holds the instrument before him, and uses both hands in twitching the cords. The music thus produced is soft and plaintive; the tunes are few, short, and extremely monotonous. The *lokanga* is made of a piece of wood notched at one end so as to form 8 or 4 rests for the cord or string. One string is stretched upon it and attached to the head of a hollowed calabash. The music it affords is feeble and dull. The women sing in chorus with much skill and effect, and the villagers often assemble and pass the evening in singing and dancing.—The dress of the Madagascans is uniform and simple. It consists generally of 2 and at most of 3 garments, which are chiefly of hemp or cotton, varied among the slaves and poorer classes by a cloth inferior to either of these, and manufactured from the bark of the rofia, the banana, and some other trees; and among the rich by silk or foreign cassimere and broadcloths. One of these garments is the *salaka*, a piece of cloth about a yard in width and two yards long. This is fastened round the loins, passing under the body, and having the extremities in front reaching to the knees. The women wear a cloth called *kitamby*, of the same materials as the *salaka*, but considerably broader. It is worn round the person immediately below the breast, and reaches nearly to the feet. But the most important and characteristic part of the native dress is the *lamba* or mantle, which varies in dimensions and quality with the rank and circumstances of the wearer. It is worn by both sexes and all classes, both adults and children; for adults it is usually 3 or 4 yards in length and 2 or 3 in breadth. The royal *lamba*, which is held in the highest estimation, is of fine scarlet English broadcloth, bordered and richly ornamented with gold lace. It is worn by the king on sacred festivals and other state occasions. The use of a dress entirely scarlet is the exclusive privilege of the king, to whom is restricted also the distinction of using a scarlet umbrella. The *lamba* is worn by all classes over the shoulders, whence its folds hang loosely, reaching nearly to the ankles, the ends being drawn together in front of the wearer. On the persons of the men it is adjusted so as to hang principally over the left shoulder; as worn by the women, over the right.—The Madagascans are remarkably fond of peddling and

of frequenting public markets, which are held every day in the week in the neighborhood of the large towns, and at which vast multitudes assemble. Foreign commerce has long been carried on with the Arabs from Muscat and with traders from the W. coast of India, who brought raw silk, cloth, powder, trinkets, and other articles to the port of Mojanga on the E. side of the island. American vessels for many years past have resorted to the same port to exchange cloth, hardware, furniture, powder, and firearms, for hides, beef, and guma. A similar trade is maintained with Mauritius and the Cape of Good Hope.—The government of Madagascar is a despotism, modified and tempered by customs and usages which have the force of law. Of late years, however, the military force at the command of the sovereign has so much increased, that there is little or no practical check upon the royal authority. The succession to the crown is hereditary in the royal family, but not in the direct line of descent, for the reigning sovereign designates at pleasure his successor without regard to the strict rules of inheritance. Females are not excluded from the throne, the present ruler being a queen. The nobles or *andriambacanti*, who rank next to the members of the royal family, also fulfil the functions of judges. Their number is not fixed, but usually there are about 12 residing at the capital. Their business is to hear causes and decide by what appears to them the equity of the case. The officers of the army constitute also a powerful and well organized aristocracy. Rank among them is conferred by number from one up to 18. A colonel, for example, is a noble of the 9th honor, a general of the 11th, and a field marshal of the 18th. The army is large, well armed, and disciplined in the European manner. The revenues of the government arise from taxes, duties and customs, fines and confiscations. They are not large, but the property belonging to the crown is considerable, and the practice of using the services of the subjects without paying for them precludes in a great measure the necessity of a large money revenue.—The religion of the Madagascans is a rude and confused idolatry, accompanied by a vague belief in a supreme God, whom they call *Andria-manitra*, "the prince of heaven." The people worship 12 or 15 principal idols, belonging respectively to different tribes or classes, of whom they are supposed to be the guardians or tutelar gods. Four of these are superior to the others, and are considered public and national. Little is known, however, of these idols, as it is considered injurious to endeavor to obtain a sight of them. The only one of which foreigners have obtained correct information is a piece of wood cut into a rough imitation of the human figure. The names of the two greatest idols are *Rakelimalaza* and *Ramahavaly*. They are kept each at small villages about 7 miles from the capital, where they are lodged in houses resembling the common dwellings of the people, there being no temples

in Madagascar, and no priests except the men who have charge of the idols. The Madagascans are much addicted to divination, which they practise in a systematic manner according to certain definite rules, with the help of beans, rice, straw, sand, or any other object that can be easily counted or divided. They also cast nativities and foretell fortunate days, regarding however, in their calculations for this purpose, not the stars, but the moon and its phases. The custom of trial by ordeal also prevails extensively among them, principally by causing the accused to drink a decoction of a poisonous fruit called the *tangena*, a small dose of which acts as an emetic, while a large dose is generally fatal. By skilfully managing the size of the dose, those who administer it have it in their power to decide the result.—The Madagascans have no records of their own history, but from their traditions and usages there is reason to believe that none of the races now existing in the island were its primitive inhabitants. An extinct race called the Vazimba seem to have preceded the present population. Nothing is known of them except that they dwelt in the interior, and at a remote period were conquered by invaders and in time exterminated. The existence of the island was first made known to Europeans by Marco Polo in the 13th century. He did not visit it, but gathered in Asia some vague ideas of its extent and position. It was discovered in 1506 by Lorenzo Almeida, son of the first Portuguese viceroy in India. The Portuguese not long afterward made a settlement on the banks of the river Franchère in the province of Anosy, but their colony was soon massacred by the natives. The French in 1643 made an attempt to possess themselves of Madagascar, and settled a colony in Anosy. Several expeditions were subsequently sent thither, and for some years the French had considerable influence in the southern provinces, and claimed sovereignty over the whole country: but the climate and wars with the natives eventually compelled them to abandon the island. In 1642 the English had a fort at St. Augustine's bay, with a garrison of 200 men, of whom one fourth died of fever in two years, and the settlement was soon broken up. For a considerable period Madagascar was not molested by Europeans, till about the beginning of the 18th century the island became a favorite resort of pirates, among the first of whom was the famous Capt. Kidd. In time the pirates, led by a Frenchman named Misson, formed a settlement and a sort of commonwealth, which they called *Libertalia*, on the N. E. coast. After committing great depredations, these buccaneers were suppressed by powerful naval forces sent against them by several European governments. About 1745 the French East India company took possession of the island of St. Mary's on the E. coast, and made a settlement there, and in 1768 they established another colony at Fort Dauphin at the S. E. extremity of Madagascar. In 1774 the celebrated Hungarian adventurer,

Count Beniowsky or Benyowsky, undertook to conquer Madagascar, and for a time met with considerable success; but his plans were frustrated by his violent death in 1786. At the beginning of the present century Madagascar was divided into a number of independent states, one of the most powerful of which was the kingdom of Imerina, a subdivision of Ankova, the country peopled by the Hovas. In 1808 Radama (born in 1792), the descendant of a long line of kings, ascended the throne of Imerina on the death of his father Impoina. This able and ambitious monarch in 1816 was visited by British agents, whom he received with great favor, and with whom he formed a treaty in 1817, by which the slave trade was abolished on condition of an annual supply of ammunition and arms from the British government, which also sent men to instruct the native soldiers in military tactics. With the arms and discipline thus obtained, Radama in a few years was enabled to subdue the whole island. In 1818 the London missionary society sent a number of missionaries, accompanied by artisans to instruct the people in the useful arts. The native language was reduced to writing, a grammar prepared, and the Bible translated and printed. In the course of 10 years about 15,000 of the natives had learned to read, and a large number were converted to Christianity. Mr. Hastie, an Irishman sent by the British government as its agent, resided several years at the capital, where he had great influence. His counsels, which all tended to promote civilization, had much weight with Radama, who was strongly imbued with love of truth and justice, and was humane and gentle in character. The king gave all the encouragement in his power to the missionaries, and immense advances were made in civilizing the kingdom. Infanticide and a variety of other cruel customs were abolished, and rapid progress was made in the useful arts and in education. The premature death of Radama in 1828 put a stop to the advance of Madagascar in this direction. He was succeeded by his widow, Ranavalona, who soon exerted herself to undo the work of her predecessor. The schools were closed and the missionaries driven from the island in 1836. The influence of the idol-keepers and of the supporters of divination and other superstitions was restored to its former supremacy. The profession of Christianity by any of the natives was prohibited, and violent persecution of the native Christians commenced, in which many suffered martyrdom with heroic fortitude. In 1845 the foreign traders at Tamatave were ill-treated, and appealed for assistance to the English governor at Mauritius and to the French governor at Bourbon, who sent one English and two French men-of-war to Tamatave. After fruitless conferences and attempts at negotiation, the Europeans bombarded and burned the town, and landed to attack the fort, but were repulsed by the natives with considerable loss. From this period all amicable intercourse between the French and English and

the Madagascans ceased for 8 years, till in 1853 commercial relations were renewed by the payment of an indemnity to the queen of the island. In 1846 the queen's son, then 17 years of age, embraced Christianity; and through his influence Christian doctrines were more widely spread than ever in Madagascar. In 1849, however, a fresh persecution broke out, and more than 2,000 persons were arrested and punished for their faith, some of them with death. In 1857 a conspiracy organized by French emissaries for the overthrow of the queen's government led to another persecution of the Christians, in which 2,000 persons were put to death. In 1859 the French made another settlement at Bally on the E. coast, under pretext of a cession of territory by a native chief who assumes to be independent of the queen. The latter, however, claims sovereignty over the whole island. —The Madagascan language belongs to the Malayan or Polynesian family of languages. Its close relation to the dialects of New Zealand, the Society and Sandwich islands, is shown not only in the signification of words of the same sound, but in the arrangement and grammatical structure of the language; though from Madagascar to Easter island, the extreme limit eastward of the Polynesian tongues, extends a space exceeding by 20 degrees of longitude half the circumference of the globe. From Africa, on the other hand, though separated only by a comparatively narrow channel, Madagascar seems to have received very few words. The following examples will be sufficient to show the strong similarity between the Madagascan and the Tahitian: Madagascan *tany*, Tahitian *tana*, land; Mad. *laniti*, Tah. *lani*, sky; Mad. and Tah. *mata*, the human face; Mad. *nio*, Tah. *niv*, the coconut tree. In Madagascan the numerals from one to ten are *isa*, *roa*, *telo*, *efatra*, *dimy*, *enina*, *fitu*, *talo*, *sivy*, *folo*; in Tahitian, *tahi*, *rua*, *toru*, *maha*, *rima*, *ono*, *hitu*, *earu*, *ira*, *auru*. The copiousness, precision, and philosophical structure of the Madagascan language render it probable that it was derived originally from a tongue spoken by a civilized people. Sir Stamford Raffles, in his "History of Java," remarks: "One original language seems in a very remote period to have pervaded the whole Indian archipelago, and to have spread, perhaps with the population, toward Madagascar on one side and the islands of the South sea on the other. . . . In proportion as we find any of these tribes (from Madagascar to the South sea) more highly advanced in the arts of civil life than others, in nearly the same proportion do we find the language enriched by a corresponding accession of Sanscrit terms, directing us at once to the source whence civilization flowed toward these regions." A considerable number of Arabic words are found in Madagascan, among them the names of the days of the week, of the months, and the terms used in divination and sorcery. These have doubtless been introduced by the Arab traders who from time immemorial have visited the coasts

of the island. Throughout Madagascar one language prevails, though varieties of dialect exist, the speech of the interior being slightly different from that of the coast in pronunciation; the letter *l*, for example, being frequently used on the coast where *d* is employed in the interior, as in *oly*, a charm, which in the interior is *ody*. The structure of the language is simple and easy, but it admits both of great force and elegance of expression. It is so copious that there are as many as 20 different words to express the various modes in which the horns of a bullock grow, up or down, straight or crooked, &c., and about 30 names for the different modes in which the natives plait their hair. It readily admits of a vast variety of compound words, and has great facility of forming numerous derivatives, agreeably to fixed rules, from one simple root, which derivatives convey shades of meaning that in other languages are expressed by cumbersome phrases; for example, *mody* is "to go home;" *tampody*, "to go out and return home the same day." The Rev. Dr. Griffiths, in his grammar of the language, the latest published, states that some single roots will produce 200 words of different orthography and signification. The English missionaries, who reduced the language to writing in 1817, adopted the Roman characters. The alphabet consists of 21 letters, the *c*, *g*, *u*, *v*, and *s* of the English alphabet being omitted. *G* is always hard, as in *go*; *c* is expressed by *s* or *k*, *u* by *io*. The vowels are pronounced as in the languages of continental Europe. For the sake of euphony, in speaking, several of the consonants are changed when they follow other consonants; thus *f* changes into *p* after *m*; *h* into *k* after *n*; *l* into *d* after *n*, and *t* into *d* after *n*; *e* into *b* after *m*, and into *d* after *n*; *nr* assumes *d* and becomes *ndr*, and *t* is inserted after *n* before *s*. Every word ends with a vowel, which gives a peculiar softness and harmony to the language. There is but one article, *ny*, the. The noun without the article is indefinite. The nouns admit of no inflections to signify number, case, or gender. Case is indicated by the position of the noun in the sentence, or by the use of prepositions, and gender is determined by the addition of the word *lahy* for male and *vaay* for female. Adjectives are not numerous, and they admit of no inflection. Many are formed by affixing *ma* to the roots; as *loto*, filth, *maloto*, dirty; *dio*, purity, *madio*, pure. They usually follow the noun, as *trano aro*, house lofty; *rano marico*, water shallow. The comparative is formed by adding the word *noho*, as *tsara*, good, *tsara noho izy*, better than he; or by repeating the positive and adding *koko*, as *tsara tsara koko*, better. The superlative is formed by adding *indrindra*, exceedingly, as *tsara indrindra*, best. Some classes of pronouns are numerous, especially the demonstrative, which add greatly to the precision of meaning by pointing out definitively the position, nearness, or distance of the persons or things spoken of. The moods of the verbs are

the indicative and the imperative, the subjunctive and potential being formed of the indicative with parts of the auxiliary verb. The tenses are past, present, and future. Additional tenses expressive of more definite time than past and future are formed by certain particles and parts of the substantive verb. The tenses are formed by the change of the initial letters and auxiliary particles. The Madagascans have as yet no native literature, all the books in their language having been written by foreigners, who seem to have found no difficulty in expressing any ideas they wished to convey.—See "History of Madagascar," by the Rev. William Ellis (3 vols. 8vo., London, 1838), and "Three Visits to Madagascar," by the same (London and New York, 1859).

MADAME (Fr. *ma* and *dama*, my lady), a French title, originally applied only to female saints and ladies of quality, but now common to all married women of whatever rank or condition. Under the old French monarchy the daughters of the sovereign received this title at their birth, and were designated Madame Elisabeth, Madame Victoire, &c., the eldest only being called simply Madame. It applied more particularly perhaps to the wife of Monsieur, the king's eldest brother, or to the eldest daughter of the dauphin, by but one of whom, however, it could be borne at a time. The daughters of the king's younger sons and of his brothers and uncles were called mesdemoiselles, the one taking precedence of the others in rank or birth being Mademoiselle.

MADDEN, Sir FREDERIC, an English antiquary, and one of the principal officers of the British Museum, born in Portsmouth in 1801. In 1826 he was employed to assist Mr. Roscoe in preparing a catalogue of the MSS. belonging to Mr. Coke - now earl of Leicester of Holkham; and from 1826 to 1828 was engaged in the British Museum to assist in compiling the classical catalogue of printed books. He then became assistant keeper of the department of MSS., and in 1837 succeeded to the keepership. He has published many works relating to literary antiquities among them are editions of the romances of "Havelok the Dane" and "Sir Iwanhoe," the Saxon poems of "Layamon's Story," "Wulfstan's Sermon," "The Privy Purse Expenses of the Princess Mary," and the introduction to "Munimenta Britannica" selected from British and Early Printed Books." He has also contributed many articles to the "Archæologia," among which are entitled "Observations on the Language of Shakespeare;" "Remarks upon the Evidence as supporting the authenticity of the manuscript autograph of the great poet found in a copy of a translation of Montaigne's "Essays."

[illegible]

of Europe, and is largely cultivated in France, Asia Minor, and Holland, and also in some parts of the United States, especially in Delaware and Ohio. The roots are perennial, but the stalks are annual. The latter are slender, of quadrangular form, jointed, growing only a few feet in length, and furnished with prickles, by which they are held inclimbing upon other plants. The branches proceed in pairs from the joints; they bear at the points where they subdivide a number of elliptical, pointed, rough leaves, and terminate in a spike of yellow flowers. The fruit is a round black berry. The roots, proceeding from a central head, are long succulent fibres. Those esteemed the best for dyers' use are from the size of a goose quill to that of the little finger, and of the 2d or 3d year's growth. When stripped of the dark bark which covers them, they appear semi-transparent, are of a reddish color, and possess a bitter taste and a strong peculiar odor. The plants are propagated by shoots, which are planted in August about a foot apart, and left to grow for two years being kept free from weeds. They are also raised from seed; and as the madder of hot climates affords more coloring matter and of a deeper tint than that of colder regions, it is well to procure the seed for northern localities from this source. When the roots are dug, they are dried in the air and in kilns, threshed with a flail to remove the cuticle, and several times winnowed and sifted with sieves of increasing fineness; the dust and sand which pass through the last sieve are rejected, and the fibrous portions which remain are further cleaned and sorted. The coarsest fibres are estimated the best. They are again dried in stoves until they break easily when squeezed in the hand; and after this they are cut up by a machine furnished with knives, and then ground between millstones, and the powder is sifted. In countries the powdered roots only are called madder, the whole roots having known by the name of liozzi; the variety called moule or bilon is of inferior quality, consisting of the lower end and extremity of the larger roots, mostly impurities, and the refuse from the others. The province of Turkey is an extensive producer both of ground and unground madder, the fields of 60,000 acres of 2½ cent. each. The soil conditions are warm dry lands. Armenia and Cappadocia also produce the roots are gathered and packed by means of a portable press, and loaded in 2½ cent. each. The entire production varies with the price the growers receive, so that the roots when the price is low, and when too high they often take care up to one half cent. and 2 cents each. They should be in the ground 2 to 3 years maturing in the soil. Some are sold in bales made up in this way like old gun cotton, and some come down the river in the ad, per cent. The European markets are flourishing at present in Dutch East India and Ceylon, and of the latter. In America we have no such quantity. Many sorts are prepared without admixture of the substance and are sometimes sold under the name of China madder, &c.

The powders are improved by being kept from one to three years in the cask. They undergo in this time a process of fermentation, the particles agglomerating and expanding, often with sufficient force to cause the heads of the casks to swell out. The madder becomes so hard that it can be removed only by cutting it out with chisels. From analyses of the ashes of madder made in Lowell, Mass., by Mr. Carnes, with the view of discovering the cause of the superiority of Avignon madders, which require no addition of carbonate of lime to increase the stability and brightness of their colors, as do the Turkey and American madders, it was found that the ashes contained 32.76 per cent. of this mineral substance, while those of the Turkey madder contained 18.35, and of the American madder, raised in Montague, Mass., 23.39 per cent. This fact, and that of the French madder effervescing when treated with dilute acid, which the others do not, led Mr. Carnes to the opinion that carbonate of lime was introduced into the French roots in the process of grinding; and he inferred that if the American were treated in a similar way, it would rank with the best madder in the world, for the colors obtained with it after it was treated with 4 to 6 per cent. of chalk were superior to those of the best French madders.—In dyeing, the common reds employed for cottons are prepared from madder, and in calico printing this dye is particularly convenient on account of the variety of tints it affords when used with different mordants. The composition of madder is exceedingly complicated from the great number of organic and inorganic substances it contains. Berzelius and Runge separated 5 coloring matters, which they designated as madder red, purple, orange, yellow, and brown; but others believe them modifications of 8 coloring principles, which by Dr. Schunck and Mr. Higgins are described as a yellow, called xanthine, an orange, rubiacine, and a red, alizarine. Mr. Higgins regards the xanthine as convertible by oxidation into rubiacine, and this into alizarine, a change which takes place in madders kept for some time in the cask, thus improving their quality; and it is also the result of the process of dyeing when this is skillfully conducted by beginning at a low temperature, and gradually increasing the heat. An artificial preparation of madder, called garancine, has been largely manufactured in Avignon and Alsace since the discovery of the process by Robiquet and Colin in 1828. This substance Mr. Higgins found to be a very pure quality of alizarine. It is prepared by treating the pulverized madder with hot dilute sulphuric acid, and then washing it thoroughly with water; this being drained off, the madder is dried by steam heat and finally ground.—Madder is often adulterated, sometimes with earthy substances, the presence of which is easily detected by the grittiness of the article when chewed; but more frequently with saw dust, as of pine bark, mahogany, logwood, &c., substances that seriously impair its qualities as a dye, and are very diffi-

cult of detection and separation. Hence, to judge of the value of samples of madder, it is necessary to submit them to actual trial upon pieces of cloth prepared with different mordants in order to determine their tinctorial power and peculiar hues.—A singular property possessed by madder was first noticed by John Belchier, an English surgeon, in 1736, and subsequently attracted much attention from physiologists, especially Haller and Hunter. He observed that the bones of pork served at table were of a red color, and on investigation traced the cause to the hogs having been fed on bran which had been boiled with printed calicoes in order to brighten their colors. It was afterward ascertained that the color of madder was very rapidly deposited on the external portion of bones of animals that partook of the dye in their food. No point of ossification in the system escaped its action. Pigeons soon exhibited a red circle round the iris of the eye, where in birds there exists a circle of minute osseous pieces. Flourens in 1839, by a series of experiments upon pigeons fed alternately with food mixed with madder and food free from it, was led to very interesting conclusions as to the manner of growth and absorption of bones, the former resulting from external accretion, and the latter taking place on the inner surface, except in the teeth, in which the operations are reversed. The milk of cows that feed upon it is stated to be tinged of a reddish color, which is imparted to the butter. But there is little ground for the opinion of Beckmann, that Virgil in his 4th Eclogue referred to madder under the name of *sandyx*, in the line: *Sponte sua sandyx pascentes vestiet agnos*, there being no authentic case recorded of either wool or hair made red by an introduction of madder in food.—The imports of madder into the United States in the year ending June 30, 1859, chiefly from France, were valued at \$3,156,408 for madder ground or prepared, and \$44,138 for madder root.

MADEIRA (Port. *madera*, timber, so called from its original thickly wooded appearance), an island in the N. Atlantic ocean, 800 m. from the coast of Africa, belonging to Portugal, of which kingdom it forms a province and integral part. Its E. point is in lat. 32° 44' N., long. 16° 38' W.; its W. point in lat. 32° 49', long. 17° 16'. In shape it is a parallelogram, about 38 m. in average length from E. to W., and 11 m. in average breadth. The area is 407 sq. m.; pop. in 1857, about 82,000, having been much decreased by emigration and the cholera. For municipal purposes the island is divided into 9 districts called *concelhos*. The capital is Funchal. A range of mountains traverses the island from E. to W., of which the highest summit, Pico Ruivo, is in the centre, and is 6,100 feet above the sea. On each side of the main chain ridges enclosing deep ravines run to the sea, where they terminate in bold headlands. The whole coast, with slight exceptions, is bounded by precipices of basalt, and the entire

island is little more than a huge basaltic rock. It is for the most part of volcanic origin, though there are now no symptoms of active subterranean fires. The general appearance of the country is exceedingly rugged, and the scenery of the grandest character of alpine magnificence mingled with landscapes of exquisite loveliness. "No artist's pencil," says an English writer, Mr. E. V. Harcourt, "has ever done full justice to the scenery of Madeira; what then can be expected from a bare description? There is an aerial magic in it which you must go thither duly to appreciate. The various colors of the soil, with mingled hues, black, yellow, red, and white, the vivid verdure, and the ever-changing shadows of the sky, give a warmth of tint and a diversity of effect which is characteristic and striking. Here is not the unintermitting blaze and eternal blueness of a tropical, nor the cold haze of a northern atmosphere; but the sunshine is broken and mellowed by fitting clouds, and a series of dissolving lights and shades surround you on every side, which must awaken pleasure and admiration in the breast of the most insensible." The climate of Madeira is singularly mild and equable, the mean annual temperature of Funchal being about 66°. The mercury has never been known to fall below 46°, and very seldom falls to 48°, while on the coast it scarcely ever rises higher than 80°. The average annual fall of rain is 80 inches, and of this quantity about one half falls in winter. There is usually a rainy period in September or October, and again in January. From January to June rain falls at intervals, but from June to September the weather is clear and settled. The island is much resorted to by invalids suffering from pulmonary disease. A distinguished physician, Sir James Clark, says: "When we take into consideration the mildness of the winter and the coolness of the summer, together with the remarkable equality of the temperature during the day and night, as well as throughout the year, we may safely conclude that the climate of Madeira is the finest in the northern hemisphere. That great and lasting benefit is to be derived by an invalid from a temporary residence in the climate of Madeira many living examples sufficiently prove." Mr. John A. Dix, in his "Winter in Madeira" (New York, 1850), says: "It is as a winter climate that Madeira is sought by invalids, and certainly no district or country can be found which, for dryness and moderate warmth combined, presents so many advantages. There is scarcely a day on which an invalid need be kept within doors during the whole 24 hours on account of rain; the sun is rarely too warm for exercise in the open air; and with an overcoat the cold is never uncomfortable. It would be difficult to find a climate within the reach of European or American invalids of which as much can be said."—There are no mines in Madeira, and the only metallic product is a little lead. The vegetable productions comprise maize, wheat, barley, sugar cane, arrow root, coffee, potatoes, sweet

potatoes, pumpkins, beans, cabbages, and onions. Among the fruits are the orange, peach, guava, fig, mango, pineapple, custard apple, granadilla, banana, and apples, pears, cherries, grapes, walnuts, and mulberries. There are extensive woods of chestnut on the mountains, producing great quantities of nuts, which form an important part of the food of the people. The island produces 80 or 90 plants peculiar to itself, but the greater part of the flora resembles that of the Canary islands and of the regions around the Mediterranean. The most remarkable forms of the indigenous vegetation are the dragon tree and a species of cactus, the latter of which exists in great abundance in the lowlands. The laurels, of which there are 4 kinds, are also conspicuous; and the juniper attains the height of 50 feet and yields a valuable scented wood. Madeira has no indigenous land mammals, but cattle, goats, horses, asses, rabbits, rats, and mice have been introduced since its discovery by the Portuguese. The horses are small, but active and hardy; they are used only for riding, oxen being employed for draught. The only bird peculiar to the island is a wren, but about 80 species breed there, among which are the kestrel, buzzard, and barn owl, the black-bird, redbreast, goldfinch, quail, partridge, woodcock, two kinds of swallows and three of pigeons, and the green Canary bird from which the domesticated species is derived. There are very few reptiles, and none poisonous; the most common is a small lizard. About 190 species of fish are found near the island, many of which are peculiar. Among them are the torpedo, the stag-horned horse fish, striped remora, flying fish, sword fish, trumpet fish, and several curious species of shark. About 1,900 species of insects have been enumerated, and about 119 species of shells have been found, of which 111 are peculiar to the island.—The people of Madeira are of mixed Portuguese, Moorish, and negro descent. The men are well formed and strong, with black hair and eyes; the women are generally far from handsome, though they have fine eyes and hair. The lower classes are gay, polite, respectful to their superiors, industrious, and capable of long continued labor; they are entirely uneducated. The upper classes are indolent, and have little intellectual cultivation, though they usually learn French or English so as to speak those languages. The morals of the natives are not very strict, illegitimate children being numerous. At Funchal there is a resident British population, which amounted in 1856 to 75 families and 295 persons. About 800 invalids annually visit the island, and reside there during the winter and spring.—The agriculture of Madeira is conducted in the primitive Portuguese manner, with very rude implements. Immense labor has been expended upon the soil in the erection of terrace walls to prevent the earth of the slopes of the hills and mountains from being washed into the sea by heavy rains; and in the construction of water courses to conduct the water of the mountain

springs to the cultivated land, to the fertility of which irrigation is essential. For nearly 4 centuries previous to 1852 the staple product of the agriculture of Madeira was the vine, which yielded the celebrated wine bearing the name of the island, of which the annual export averaged 5,000 pipes, each pipe containing 92 gallons. In that year disease began to infect the vines, which soon stopped the production of wine, and has at length nearly destroyed the vines themselves. The rearing of the cochineal insect has been introduced to give occupation to those thrown out of employment by the failure of the grape crop. The commerce of the island depended almost entirely on the wine, and was chiefly in the hands of resident British merchants. The entrances at Funchal (the only port) in 1855 were 75 British and 117 other vessels, and the clearances 77 and 107. The value of imports in 1855 was £110,210, and of exports £75,280. The customs duties on imports in 1855-'6 were £18,119, 16 per cent. more than in the preceding year. The imports of Madeira wine into the United States in the year ending June 30, 1859, were valued at \$55,000, about one third of which came direct from Madeira and the rest through France, Spain, England, and other countries. The chief imports of the island are manufactured goods, iron ware, grain, salt, and timber. Grain is imported from the Azores and from the coast of Africa. Two English sailing packets ply between London and Madeira, and a Portuguese packet brig runs between the island and Lisbon. Funchal also is a coaling station for the British mail steamers to Brazil and the African coast, which touch there once a month on the outward voyage and again on the return, and the Portuguese and French steamers to Brazil also touch there. The manufactures of Madeira are insignificant, consisting chiefly of baskets, straw hats, coarse linens and woollens, shoes, artificial flowers, sweetmeats, and some needlework embroidery made by the women for exportation.—The government of the island is in the hands of a civil governor appointed by the crown. The law is administered by two chief judges also appointed by the crown, but minor cases are decided by magistrates elected by the people. The island sends 4 deputies to the cortes at Lisbon, who are chosen by the male inhabitants who have incomes of \$100 a year. The Roman Catholic religion is established by law, but Protestants of foreign birth are allowed the free exercise of their religion. Funchal is the see of a bishop who has jurisdiction over 49 parishes, each with its church and resident priest. By law all children at a certain age should be sent to school, but the law is not enforced, and only a small part of the children receive education. In 1854 the number of pupils in all the schools was 2,710, and the amount expended by the government for education about \$6,000.—Belonging to Madeira, and about 11 m. S. E. from it, are 3 very small, rocky, and uninhabited islands, called the *Desertas*. The island of Porto Santo, also dependent on Madeira,

lies about 25 m. N. E., and is 6 m. in length by 3 in breadth. It is the seat of a lieutenant-governor, and in 1854 had 1,708 inhabitants, the greater number of whom live in a small town (the only one in the island) on its S. side. Porto Santo was discovered in 1419 by two Portuguese captains, who were accidentally driven there by a storm while on their way from Portugal to the coast of Africa. The next year an expedition sent out to colonize Porto Santo discovered Madeira, and settled there. Between 1680 and 1640 Madeira with Portugal itself belonged to the Spanish crown. In 1801 the island was garrisoned by British troops for 6 months to protect it from the French, and in 1807 it was taken possession of by the British, who held it till 1814.

MADEIRA, MADERA, or CAYARA, a river of Brazil, formed by the confluence of several rivers, the largest of which are the Guapora, Mamore, and Beni, taking its name at the junction of the last in lat. 10° 30' S., long. 66° 40' W. It flows N. E. for about 700 m., and falls into the Amazon, of which it is the largest tributary, in lat. 3° 30' S., long. 59° 10' W. During its course it receives a great many affluents, many of them considerable. It is navigable by small vessels for about 500 m. above its mouth; beyond that for about 200 m. it is obstructed by cataracts, of which there are 17. Its whole length, including the river Mamore, is about 1,500 m.

MADISON, the name of counties in 17 of the United States. I. A central co. of N. Y.; area, 670 sq. m.; pop. in 1855, 43,687. Oneida lake is on its N. border, and Owahgon or Cazenovia lake on the W. Its principal streams are the Unadilla and Chenango rivers, and Chittenango and Oneida creeks. The central and S. portions are hilly, the N. low and swampy. The productions in 1855 were 57,236 bushels of wheat, 571,637 of oats, 449,583 of Indian corn, 197,281 of barley, 224,378 of potatoes, 581,677 of apples, 68,268 tons of hay, 102,581 lbs. of flax, 1,840,298 of butter, and 2,087,594 of cheese. There were 21 coach and wagon manufactories, 22 grist mills, 75 saw mills, 94 churches, and 15,661 pupils attending public schools. The New York central railroad intersects the N. part of the county. Capital, Morrisville. II. A N. E. co. of Va., bounded N. W. by the Blue Ridge, and S. E., S., and S. W. by the Rapidan river; area, 276 sq. m.; pop. in 1850, 9,331, of whom 4,724 were slaves. Robertson's and Hazel rivers have their sources in the county. The surface is elevated and noted for its fine scenery. In the valleys the soil is fertile. The productions in 1850 were 186,684 bushels of wheat, 343,448 of Indian corn, 51,800 lbs. of tobacco, and 17,391 of wool. There were 27 grist mills and 16 saw mills. Value of real estate in 1856, \$2,140,567; increase since 1850, 17 per cent. Capital, Madisontown. III. A W. co. of N. C., bordering on Tenn., and intersected by French Broad river; area, about 450 sq. m. The county was formed in 1850 from Buncombe and Yancey cos., and is not included

in the U. S. census of that year. It has a hilly surface, lying on the S. E. declivity of Bald mountain. Capital, Marshall. IV. A N. E. co. of Ga., drained by branches of Broad river; area, 275 sq. m.; pop. in 1859, 5,891, of whom 1,096 were slaves. The surface is undulating, and the soil varies in fertility. It has some mineral springs, and contains gold, granite, and iron ore. The productions in 1850 were 195,421 bushels of Indian corn, 31,365 of sweet potatoes, and 2,219 bales of cotton. There were 11 churches, and 231 pupils attending schools. Value of land in 1856, \$618,526. Capital, Danielsville. V. A N. co. of Fla., bordering on Ga., and bounded E. by the Suwanee and Withlacoochee rivers and W. by the Oodilla; present area, about 650 sq. m.; pop. in 1850, 5,490, of whom 2,688 were slaves. Since that census it has been reduced to less than $\frac{1}{2}$ its original size, Taylor and Lafayette cos. having been formed from it. The productions of the original county in 1850 were 63,630 lbs. of rice, 226 bhd. of sugar, 5,924 bales of cotton, and 46,320 galls. of molasses. Capital, Madison. VI. A N. co. of Ala., bordering on Tenn., bounded S. by the Tennessee river and intersected by Flint and Paint Rock creeks; area, 760 sq. m.; pop. in 1850, 26,427, of whom 14,326 were slaves. It has a hilly surface, and a fertile and well cultivated soil. The productions in 1850 were 1,195,037 bushels of Indian corn, 80,535 of sweet potatoes, and 20,888 bales of cotton. There were 18 grist mills, 18 saw mills, 48 churches, and 980 pupils attending schools. The Memphis and Charleston railroad intersects the county, passing through the capital, Huntsville. VII. A central co. of Miss., bounded W. by the Big Black river, and S. E. by the Pearl river; area, 720 sq. m.; pop. in 1850, 18,173, of whom 13,843 were slaves. The productions in 1850 were 785,485 bushels of Indian corn, 175,230 of sweet potatoes, 54,821 lbs. of rice, and 14,863 bales of cotton. There were 26 churches, and 526 pupils attending schools. The New Orleans, Jackson, and great northern railroad intersects the county, passing through the capital, Canton. VIII. A N. E. parish of La., bordered by the Mississippi river on the E., and intersected by the Tensas; area, 700 sq. m.; pop. in 1855, 9,980, of whom 8,603 were slaves. It has a low surface and a fertile soil. The productions in 1855 were 440,410 bushels of Indian corn, and 84,872 bales of cotton. Value of real estate, \$3,114,287. Capital, Richmond. IX. An E. co. of Texas, formed in 1853 from Grimes, Walker, and Leon cos., bounded E. by the Trinity river, and W. by the Navasota; area, about 550 sq. m.; white pop. in 1857, about 1,800. The surface is rolling, covered with pine and oak; the soil good in the bottoms, sandy elsewhere. Capital, Madisonville. X. A N. W. co. of Ark., bordering on Mo., drained by White river and its branches; area, 1,000 sq. m.; pop. in 1854, 5,577, of whom 206 were slaves. It has a diversified surface and fertile soil. The productions in 1854 were 853,

418 bushels of Indian corn, 28,574 of wheat, and 84,803 of oats. Capital, Huntsville. XI. A W. co. of Tenn., watered by branches of the Forked Deer river; area, 625 sq. m.; pop. in 1850, 21,470, of whom 8,552 were slaves. The surface is undulating and the soil fertile. The productions in 1850 were 1,045,424 bushels of Indian corn, 67,245 of sweet potatoes, and 84,840 lbs. of tobacco. There were 35 grist mills, 13 saw mills, 9 tanneries, 39 churches, and 1,382 pupils attending schools. The Mobile and Ohio railroad intersects the county, and the Mississippi central and Tennessee railroad has its terminus at the capital, Jackson. XII. A central co. of Ky., bounded N. by the Kentucky river; area, 434 sq. m.; pop. in 1850, 15,727, of whom 5,393 were slaves. It has an undulating surface and fertile soil. The productions in 1850 were 1,424,856 bushels of Indian corn, 176,400 of oats, 60,511 lbs. of tobacco, and 55,409 of wool. There were 23 grist mills, 11 saw mills, 2 tanneries, 20 churches, and 1,957 pupils attending schools. Capital, Richmond. XIII. A S. W. co. of Ohio, drained by Darby and Deer creeks; area, 400 sq. m.; pop. in 1850, 10,015. It has a nearly level surface and fertile soil. The productions in 1850 were 726,451 bushels of Indian corn, 23,540 of wheat, 51,627 of oats, and 120,696 lbs. of wool. There were 9 grist mills, 2 saw mills, 5 tanneries, 24 churches, and 3,883 pupils attending schools. The Columbus and Xenia and Springfield and Columbus railroads intersect the county, passing through the capital, London. XIV. A central co. of Ind., drained by White river and its branches; area, 430 sq. m.; pop. in 1850, 12,875. It has an undulating surface and very fertile soil. The productions in 1850 were 107,483 bushels of wheat, 895,817 of Indian corn, 47,857 of oats, and 87,775 lbs. of wool. There were 12 grist mills, 10 saw mills (4 steam), 8 tanneries, 20 churches, and 2,752 pupils attending schools. There are several mounds on the S. bank of White river. The Bellefontaine railroad line intersects the county, passing through the capital, Anderson. XV. A S. W. co. of Ill., bordered on the W. by the Mississippi river, and drained by Cahokia and Silver creeks; area, 760 sq. m.; pop. in 1855, 31,556. The surface is undulating and the soil very fertile. The productions in 1850 were 88,898 bushels of wheat, 1,153,163 of Indian corn, 202,159 of oats, and 19,878 lbs. of wool. There were 15 grist mills, 9 saw mills, 3 tanneries, 78 churches, and 3,783 pupils attending schools. The Terre Haute, Alton, and St. Louis railroad, and the St. Louis, Alton, and Chicago railroad pass through the county. Capital, Edwardsville. XVI. A S. E. co. of Mo., drained by St. Francis and Whitewater rivers; area, 640 sq. m.; pop. in 1850, 6,256, of whom 571 were slaves. The soil is moderately fertile. Very fine iron and lead ores abound. The productions in 1850 were 11,439 bushels of wheat, 266,690 of Indian corn, 39,505 of oats, and 10,102 lbs. of wool. There were 5 grist mills, 6 saw mills, and 4 churches. Capital, Fredericks-

town. XVII. A S. W. co. of Iowa, drained by North and Middle rivers, tributaries of the Des Moines, and by a branch of Middle river; area, 896 sq. m.; pop. in 1859, 7,071. It has an undulating surface and fertile soil. The productions in 1859 were 12,737 bushels of wheat, 244,317 of Indian corn, 13,365 of potatoes, 7,910 tons of hay, and 5,239 galls. of sorghum molasses. Capital, Winterset.

MADISON. I. A post village, capital of Morgan co., Ga., 41 m. N. from Milledgeville and 108 m. W. from Augusta; pop. in 1850, 3,516. It is on the line of the Georgia railroad, pleasantly situated in the midst of a fertile country from which it derives an active trade. It is the seat of the Madison female college (Methodist), the Baptist collegiate institute, the Madison male academy, and a high school for boys.

II. A city and capital of Jefferson co., Ind., on the Ohio river, 100 m. W. S. W. from Cincinnati and 50 m. N. E. from Louisville; pop. in 1858, about 12,000. It is beautifully situated, at an elevation secure from floods, in a valley about 3 m. long, enclosed on the N. by a range of hills 400 feet in height. The streets are regularly laid out, and a large proportion of the houses are built of brick. It is lighted with gas and supplied with water by an aqueduct. It contains a fine court house, 2 large markets, 8 banks, 18 churches, and a number of schools. There are also many manufactories of cotton, wool, and iron, and 5 large flouring mills. It has several extensive pork packing establishments and a large trade in provisions. The exports for the year 1857 amounted to \$5,398,674, the imports to \$5,453,267. It is connected with Indianapolis by the Madison and Indianapolis railroad. It was first settled in 1808. III. A city of Wisconsin, capital of the state and of Dane co., situated in lat. 43° 4' N., long. 89° 23' W., about 80 m. W. from Lake Michigan and E. from the Mississippi river; pop. in 1850, 1,672; in 1855, 8,658; in 1860, about 10,000. It is built in the midst of the "Four Lake region," so called from a chain of beautiful lakes which extend over a distance of 16 m. and discharge their surplus waters into Yahara or Catfish river, a tributary of Rock river. Mendota or Fourth lake, the uppermost and largest, is 9 m. long, 6 m. wide, and from 50 to 70 feet deep in some places, and fed chiefly by springs; it has beautiful white gravelly shores and pure cold water. Monona or Third lake is 5½ m. long and 2 m. wide, and Lakes Waubesa and Kegonsa are each about 3 m. in length by 2 m. in width. The city of Madison occupies an undulating isthmus between Lakes Mendota and Monona, and in point of situation and scenery is the most beautiful city in the West. It is about 3 m. in length and 1 m. in breadth, and has wide, straight, and regular streets, with many beautiful buildings. The capitol, placed in the centre of a square park of 14 acres wooded with native timber, is built of limestone, and commands a fine view. It contains the state offices, library, legislative chambers, &c. A new capitol is now (1860)

erecting, which will cost \$400,000. The state university, situated here, has a fund of about \$350,000. It was founded in 1851, and in 1859 had 7 professors, 176 students, and a library of 1,900 volumes. A medical department was founded in 1856, but never went into operation. The university buildings occupy an eminence on Lake Mendota, surrounded by a park of 40 acres. Madison is also the seat of the state lunatic asylum, and contains a historical society, a commercial college, a public high school and ward schools, a number of private schools, gas works, 5 banks, and 8 churches (1 Baptist, 1 Congregational, 1 Episcopal, 1 German Evangelical, 1 Methodist, 1 Presbyterian, and 2 Roman Catholic). Three daily, 7 weekly, and 2 monthly periodicals are published here, 2 of the weekly journals being in the Norwegian language. The rich surrounding country combines with other advantages to render Madison an active commercial centre, and its sales of merchandise in 1856 amounted to \$4,702,000. The value of its manufactures and home products in the same year was \$1,265,000, consisting chiefly of stone, brick, flour, ale and beer, wagons and carriages, iron ware, clothing, and agricultural implements. It has easy communication with all parts of the country by means of the Milwaukee and Mississippi railroad; several other railroads are projected or in course of construction. Madison was chosen as the state capital in 1836, at which time it was a wilderness.

MADISON, JAMES, D.D., an American clergyman, bishop of the Protestant Episcopal church in Virginia, born in Rockingham co., Va., Aug. 27, 1749, died March 6, 1812. He was graduated at William and Mary college in 1772, chose the profession of law, and was admitted to the bar, but soon after abandoned it for the study of divinity. In 1778 he was chosen professor of mathematics in William and Mary college, and by permission of the board he went to England in 1775, and was admitted to orders by the bishop of London. In 1777 he was elected president of the college, and revisited England, where he remained till the close of 1778. During the revolution he succeeded in keeping the college in active operation. The degree of D.D. was conferred upon him in 1785 by the university of Pennsylvania. Dr. Griffith, who had been chosen as the first bishop of Virginia, having declined the post, Dr. Madison was selected for the episcopate, and was consecrated by the archbishop of Canterbury, in Lambeth palace, Sept. 19, 1790. He continued to discharge the duties of president of the college, and professor of natural and moral philosophy, international law, &c., together with those of the episcopate, until his death. His only publications were several occasional discourses, and a "Eulogy on Washington" (1800).

MADISON, JAMES, 4th president of the United States, born in King George, Va., March 16, 1751, died at his seat of Montpelier, near Orange Court House, Va., June 28, 1836. His father was James Madison of Orange, a

planter of ample means and high standing, descended from John Madison, an Englishman who settled in Virginia about the year 1653. The maiden name of his mother was Eleanor Conway. He was the eldest of 7 children, and was sent at an early age to a school in King and Queen co., under the direction of Donald Robertson, a Scotchman. He afterward prosecuted his studies at home, under the Rev. Thomas Martin, the minister of the parish, who resided at Montpelier, and acquired a competent knowledge of Latin, Greek, French, and Italian. In 1769, at the age of 18, he was sent to Princeton, N. J., where he was graduated A.B. in 1771. He continued at college, however, until the spring of 1772, pursuing a course of reading under Dr. Witherspoon, the president, for whom he had contracted a warm friendship. His habits of application were so close at this period, that his health became seriously affected. For months together, he allowed himself but 3 hours for sleep out of the 24, and when compelled to discontinue this pernicious system, limited his hours of rest to the least number consistent with the preservation of his strength. From the inroads which he made upon his constitution at this early period he seems never to have wholly recovered. In 1772 he returned to Virginia, and commenced a course of legal study, with which he mingled a large amount of miscellaneous reading and study in theology, philosophy, and belles-lettres. His attention was particularly directed to the first, and he thoroughly explored all the evidences of the Christian religion. From these pursuits he was soon diverted by public affairs. The colony was agitated by the impending struggle with England, and by internal questions of great moment. The subject of religious toleration began to assume a vital significance. The clergy of the Baptist and other nonconformist denominations had been subjected to violent persecution, and an effort was speedily made by the friends of religious rights to cure this abuse. Mr. Madison distinguished himself in his county by the zeal and activity which he displayed in defence of the Baptists particularly. In the spring of 1776 he was elected a member of the Virginia convention from the county of Orange, and procured the passage of the substance of an amendment to the declaration of rights by George Mason, which struck out the old term toleration and inserted a broader exposition of religious rights. He was in the same year a member of the general assembly, but lost his election in 1777, from his refusal to treat the voters, and the general want of confidence in his powers as a public speaker. Mr. Jefferson refers to his "extreme modesty" at this time, and he evidently distrusted his own abilities. In spite of his defeat, the legislature on its meeting in November of the same year elected him a member of the council of state; and in the winter of 1779 he was chosen by the assembly a delegate to congress. He took his seat in March, 1780, and remained in that body for 3 years.

His public services during this period were important. He strongly opposed the issue of paper money by the states, and was in favor of a formal recommendation on the part of congress against the continuance of the system. As chairman of the committee to prepare instructions to the U. S. ministers at Versailles and Madrid, in support of the claims of the confederacy to western territory and the free navigation of the Mississippi, he drew up an elaborate and able paper, which was unanimously adopted by congress. He zealously advocated in 1783 the measures proposed to establish a system of general revenue to pay the expenses of the war, and as chairman of the committee to which the subject was referred prepared an able address to the states in support of the plan, which was adopted by congress, and received the warm approval of Washington. A striking proof of the value which the people of Virginia attached to his services, is exhibited by the fact that the law rendering him ineligible after 3 years' service in congress was repealed, in order that he might sit during a 4th. On his return to Virginia he was elected a member of the legislature, and took his seat in 1784. In this body he advocated a large number of wise and liberal laws. He inaugurated the measures relating to a thorough revision of the old statutes, and gave his support to the bills introduced by the revisers, Jefferson, Wythe, and Pendleton, on the subject of entail, primogeniture, and religious freedom. He aided in the separation of Kentucky from Virginia and the formation of the new state, opposed the further issue of paper money, and took a prominent part in favor of the payment of debts due to British creditors. His greatest service at this time was the preparation, after the adjournment of the assembly, of a "Memorial and Remonstrance" against the project of a general assessment for the support of religion. This paper is one of the ablest and most eloquent ever drawn up by its author, and caused the complete defeat of the measure against which it was directed. It definitely settled every question of principle and policy embraced in the discussion, and placed the great system of separation of church and state upon an unassailable foundation. In Jan. 1786, Mr. Madison obtained the passage of a resolution by the general assembly of Virginia, inviting the other states to appoint commissioners to meet at Annapolis, and devise a new system of commercial regulations, of greater efficiency than that under the articles of confederation. Mr. Madison was chosen one of the commissioners, and attended at Annapolis in September of the same year. Five states only were represented, and the commissioners recommended a convention of delegates from all the states to be held at Philadelphia in May, 1787. The recommendation was generally adopted, and Mr. Madison was chosen one of the delegates from Virginia. The convention assembled, and the result was the abrogation of the old articles, and the formation of the constitution of the United States.

Mr. Madison was prominent in advocating the constitution, and took a leading part in the debates, of which he kept private notes, since published by order of congress. His views in regard to the federal government are set forth at length in a paper still extant in the handwriting of Gen. Washington. This paper contains the substance of a letter written to Washington by Mr. Madison before the meeting of the convention, and proposes a scheme of thorough centralization. The writer declares that he is equally opposed to "the individual independence of the states" and to "the consolidation of the whole into one simple republic." He is nevertheless in favor of investing congress with power to exercise "a negative in all cases whatever on the legislative acts of the states, as heretofore exercised by the kingly prerogative." He says further that "the right of coercion should be expressly declared; . . . but the difficulty and awkwardness of operating by force on the collective will of a state, render it particularly desirable that the necessity of it should be precluded." From these extreme views Mr. Madison afterward conscientiously departed, but in the convention he supported them with zeal and vigor. The scheme known as the "Virginia plan" was adopted instead, and the convention adjourned. The question of ratifying or rejecting the constitution remained for the decision of the states separately; and during the interval which elapsed between the adjournment of the body and the assembling of the state conventions, a warm discussion took place throughout the country upon the merits of the scheme of government, and the propriety of its adoption. Many of the ablest statesmen of the country expressed great distrust of the instrument, and opposed its ratification by every means in their power. Vehement debates took place, in public meetings and the newspapers; and the result seemed exceedingly doubtful. The subsequent adoption of the constitution was in large measure brought about by a series of essays now familiar, in their collected form, as "The Federalist." They were commenced in a New York newspaper soon after the adjournment of the convention, and continued to appear until June, 1788. The public journals everywhere republished them, and they were soon known to be the work of Mr. Hamilton, Mr. Madison, and Mr. Jay. The effect of these essays upon public opinion was very great. They changed or materially modified the views of many thousands of persons, among whom were some of the profoundest thinkers of the epoch. Jefferson wrote of the work: "In general it establishes firmly the plan of government. I confess it has rectified me on several points." The volume remains the most forcible exposition upon the side which it espoused. The whole ground is surveyed generally and in detail; the various points at issue are discussed with the utmost acuteness, and the advantages of the adoption of the instrument urged with a logical force and elo-

quence which place the "Federalist" beside the most famous political writings of the old English worthies. The Virginia convention assembled in June, and Mr. Madison was a member of the body. He soon established his claim to a prominent position among the leading men. He had succeeded in completely overcoming his natural diffidence, and, although deficient as an orator, was enabled by his profound acquaintance with every topic involved in the discussion to exert a powerful influence over his associates. On both sides were ranged men of eminent abilities. The leaders of the constitution party were Marshall, Pendleton, Wythe, Edmund Randolph, and other statesmen of high reputation. Opposed to these were Monroe, Grayson, Henry, and Mason. The two last named were a host in themselves—the one for his passionate and splendid eloquence, the other for a massive vigor of reasoning which made him almost irresistible in any discussion in which he earnestly engaged. The high position which Mr. Madison immediately assumed, and fully maintained, in a body composed of such men, is the best commentary upon the character of his intellect. He was unquestionably a great power in the convention, and contributed to the final triumph of the constitution as much as any one in the body. The instrument was adopted by a vote of 89 to 79, and the convention rose. The part which he had taken in its deliberations very greatly increased Mr. Madison's reputation as a statesman; and he was brought forward as a candidate for the U. S. senate. The attempt to elect him, however, failed. This resulted from the peculiar state of parties. Although the federalists had achieved a victory in the convention, and procured a fair majority in favor of the adoption of the constitution, they were outnumbered by their opponents in the commonwealth at large, and by the anti-federal representation in the legislature. Mr. Madison therefore suffered a defeat, and Lee and Grayson were elected in place of the candidates of the federalists. He was however chosen a representative in congress, and took his seat in that body in April, 1789. Here he found himself compelled to adopt a thoroughly independent course of action, or violate the most deeply rooted convictions of his understanding. Alexander Hamilton was at the head of the treasury department, and Mr. Madison was obliged either to support the great series of financial measures initiated by the secretary, or distinctly abandon his former associate, and range himself on the side of the republican opposition. He unhesitatingly adopted the latter course. Although he had warmly espoused the adoption of the constitution, he was now strongly convinced of the necessity of a strict construction of the powers which it conferred upon the general government. He accordingly opposed the funding bill, the national bank, and Hamilton's system of finance generally. Many proofs remain of the fact that Mr. Madison assumed this attitude of opposition to

the administration with great reluctance, and only under the pressure of his conscientious convictions of public duty. His affection for Washington and long friendship for Hamilton rendered such a step peculiarly disagreeable to a man of his amiable and kindly disposition. The tone of his opposition, however, did not alienate his former friends. It was moderate and dispassionate. Occupying middle ground between the violent partisans on both sides, he preserved himself from extreme views in either direction, and labored to reconcile and harmonize the antagonism of both parties. He thus secured the confidence and respect even of those with whom he differed. He always retained the cordial regard of Gen. Washington. On Mr. Jefferson's return from France, Mr. Madison was solicited to accept the mission, and it was kept open awaiting his decision for 12 months. He declined the place, as he afterward did the office of secretary of state on the retirement of Jefferson, from a conviction that the radical antagonism of views between himself and the majority in the cabinet would render his acceptance of either office fruitful in misunderstandings and collisions. Hamilton was the ruling power in the cabinet, and Mr. Madison, with his customary discretion, declined an honor which promised a result so unsatisfactory to himself and the party to which he had signified his adhesion. He remained in congress, and became thoroughly identified with the republicans. In 1793 he was the avowed leader of the party in congress. In 1794 he gave his full support to its foreign policy by moving a series of resolutions, based upon the report of Mr. Jefferson advocating a retaliatory policy toward Great Britain, and commercial discriminations in favor of France. These resolutions he supported by a speech of great ability. In 1795 it was the wish of many of his friends that he should become the candidate of the republican party to succeed Gen. Washington. Mr. Jefferson wrote: "There is not another person in the United States who being placed at the helm of our affairs, my mind would be so completely at rest for the fortune of our political bark." Mr. Madison however discouraged the idea. "Reasons of every kind" forbade it, he replied; and the subject was not resumed. In March, 1797, Mr. Madison's term expired, and he returned to Virginia. The period at which he vacated his seat in congress was a critical one. Events soon occurred which threatened to plunge the country into war. The insulting treatment of the American envoys to France, and the war message of President Adams, were about to be followed by the passage of the alien and sedition laws. The republicans vainly tried to stem the popular current in favor of the measures of the administration. The agitation was so intense, that the opponents of the federal party were overwhelmed. Their protests were completely drowned in the popular outburst against France, and on the floor of congress they were in a helpless minority. The

passing of the alien and sedition laws in July, 1798, gave them the first opportunity to make a stand. Opposition to even these violent measures was however ineffectual in the federal legislature; and the republican leaders determined to resort to the state arenas for the decisive struggle. It commenced in Kentucky, and resulted there in the adoption of a series of resolutions, which were followed, in Dec. 1798, by similar resolves of the Virginia assembly. The latter, now known as "the resolutions of 1798-'99," were offered by John Taylor of Caroline, but drawn up by James Madison, not then a member. They remain, together with the subsequent "Report" by the same writer, the great text book of the party in favor of a strict construction of the powers of the federal government. They declared the determination of the assembly to defend the constitutions of the United States and of the states, but to resist all attempts to enlarge the authority of the federal compact by forced constructions of general clauses, as tending to consolidation, the destruction of the liberties of the states, and finally to a monarchy. In case of a "deliberate, palpable, and dangerous" exercise of powers not clearly granted to the general government, the states had a right to interpose; and as the passing of the alien and sedition laws was such an infraction of right, the assembly protested against those laws as unconstitutional and dangerous to the liberties of the commonwealth. The 7th resolution called upon the people of other states to join with the state of Virginia "in declaring, as it does hereby declare, that the acts aforesaid are unconstitutional, and that the necessary and proper measures will be taken by each for cooperating with this state in maintaining unimpaired the authorities, rights, and liberties reserved to the states respectively, or to the people." The resolutions passed the house by a vote of 100 to 63, and were duly communicated to the several states of the Union. They met with little favor, especially in the northern states. Massachusetts and New England generally remonstrated against them, and declared the obnoxious laws both constitutional and expedient. This drew forth, in the winter of 1799-1800, Mr. Madison's "Report" in defence of his resolutions. This elaborate paper subjected the resolves to an exhaustive analysis, and defended them with masterly vigor. It is the most famous of all Mr. Madison's political writings, and will rank with the greatest state papers written in America. Although the resolutions met with an unfavorable response from the other states, they exerted a powerful influence upon public opinion. Virginia had shown how deeply in earnest she was by directing the establishment of two arsenals, and an armory sufficiently large to store 10,000 muskets and other arms; but a wholesome change in the sentiment of the country happily restored good feeling, and softened down all bitterness. The alien and sedition laws found few supporters ultimately, and Mr. Madison's views

were fully vindicated. The revulsion against the federal party and in favor of the republicans terminated in the election of Mr. Jefferson, who entered upon the presidency in 1801. Mr. Madison was offered the place of secretary of state, which he accepted, and continued to fill during the 8 years of Mr. Jefferson's administration. During this period of service his opinions upon public affairs, and his official action, closely agreed with the views of the president. He became still more popular with and acceptable to his party, and toward the end of Mr. Jefferson's second term was generally spoken of for the presidency. A caucus was finally held of the majority of the republican members of congress, and Mr. Madison was nominated. This proceeding, however, met with bitter opposition from a wing of the party, headed by John Randolph, who were friendly to the election of Mr. Monroe and inimical to Mr. Madison. These gentlemen published a caustic "Protest" against the action of the caucus, and denounced Mr. Madison for his "want of energy," his connection with the "Federalist," and his report upon the Yazoo claims. His friends defended him against all the charges, and retorted so strongly upon the authors of the protest that they were silenced. The action of the caucus was approved by the party generally, and Mr. Madison was elected by a vote of 122 out of 175, and took his seat as president, March 4, 1809. —He entered upon the presidency at a crisis in public affairs which required the utmost foresight, resolution, and prudence. Great Britain and the United States were on the verge of war. In 1807 the long series of wrongs inflicted by England upon the commerce of America, and the rights of her seamen, had been consummated by the affair of the Leopard and Chesapeake. This wanton insult had thrown the country into violent commotion, and occasioned the embargo, which had been succeeded by the non-intercourse act, prohibiting all commerce with France or England until the decrees of the French emperor and the British orders in council in relation to the seizure of neutrals and the impressment of seamen were repealed. Mr. Jefferson had retired from the presidency at this threatening crisis, and the new administration was immediately called upon to provide for the emergency. The first act of the British cabinet did not encourage hopes of peace. This was a disavowal of the course of Mr. Erskine, the English minister, in promising reparation for the affair of the Chesapeake and a repeal of the obnoxious orders in council, on condition of a renewal of intercourse on the part of the United States. Mr. Erskine was declared to have exceeded his authority, and was recalled. He was succeeded by Mr. Jackson, who was authorized to enter into negotiations for a commercial treaty. This gentleman speedily became embroiled with the secretary of state. His tone was so discourteous and insulting that the president directed the secretary to receive no further communications from him, and soon after-

ward requested his recall. This was complied with, but no censure was visited upon the envoy, and none other was sent in his place. In May, 1810, congress approved the course of the executive, declared the official communications of Mr. Jackson highly indecorous and insolent, and passed a new act of non-intercourse. This provided that if either France or England repealed her hostile decrees, and the other did not within 8 months do likewise, then intercourse should be renewed with the one, while with the other non-intercourse should be persisted in. In August the French minister for foreign affairs gave notice to the American minister that the Berlin and Milan decrees had been revoked by the emperor; and in November Mr. Madison issued his proclamation, declaring the fact, and announcing that the act of non-intercourse would be revived as to Great Britain unless her orders in council should be revoked within 8 months from the date of the proclamation. The British government resisted this demand on the ground that there was no official evidence of the repeal of the French decrees, and the act of non-intercourse was accordingly declared in full force against Great Britain. In March, 1811, the emperor Napoleon disavowed the statement of the duke of Cadore, and declared that "the decrees of Berlin and Milan were the fundamental laws of the empire." American vessels had been seized and sequestered by France even after the president's proclamation, and every overture on the part of the American minister at Paris toward the re-establishment of friendly relations between the two countries was viewed with indifference, and completely failed in its object. Such was the condition of public affairs in the beginning of the year 1812. The country was slowly but surely drifting toward a war, which no exertions on the part of the administration seemed adequate to prevent. Mr. Madison was averse from native temperament of mind to such an event, and pushed his pacific views to an extent which proved displeasing to many of the most prominent members of the republican party. The non-intercourse laws and other restrictive measures had become exceedingly unpopular with a large portion of the country, and a majority of the people were now believed to be in favor of a declaration of war against England. Mr. Clay, Mr. Calhoun, and Mr. Lowndes accordingly advised measures of preparation, and congress promptly responded. Bills were passed for augmenting the army, repairing and equipping ships of war, organizing and arming the militia, and placing the country in an attitude to resist an enemy. To carry these acts into effect, congress appropriated the sum of \$1,000,000. Mr. Madison acquiesced in this policy with extreme reluctance. He still hoped that war might be avoided. But it was obvious that the great body of the republican party were bent upon the measure, and the president abandoned his opposition, and gave his assent. In Feb. 1812, Mr. Russell, U. S. *chargé d'affaires*

at London, wrote to the secretary of state: "I no longer entertain a hope that we can honorably avoid war;" and in May, Mr. Foster, the British minister, addressed a communication to the same official, in which he distinctly reiterated the intention of his government not to depart from the position which she occupied. This communication terminated all hopes of avoiding hostilities, and on June 1 the president transmitted a special message to congress in which he reviewed the whole controversy, and spoke in strong terms of the aggressions of Great Britain upon commercial rights. The message was referred to the committee on foreign affairs, which on June 8 reported a manifesto, as the basis of a declaration of war. The discussion on the report of the committee took place with closed doors. The measure was speedily adopted in the house by a vote of 79 to 49, but the result in the senate was long doubtful. After 14 days' delay, however, that body yielded its opposition and declared in favor of war by a vote of 19 to 13. The act declaring war between Great Britain and the United States speedily followed. The president gave it his approval on June 18, and promptly issued his proclamation calling upon the people to prepare for the conflict, and to support the government. A short delay would probably have defeated the policy of the war party, and reopened the old negotiations. A decree of the French emperor had been exhibited to the U. S. minister to France, dated April 28, 1811, which declared the definite revocation of the Berlin and Milan decrees, from and after Nov. 1, 1810. In consequence of this, Great Britain, on June 23, within 5 days after the declaration of war, repealed the obnoxious orders in council in relation to the rights of neutrals, and thus removed one of the great grounds of complaint on the part of the American government. On June 26, before the course of the British cabinet was known in America, Mr. Monroe, secretary of state, wrote to Mr. Russell, who had remained in England since the recall of Mr. Pinkney in 1811, proposing the terms of an armistice. These were a repeal of the orders in council, with no illegal blockades substituted, and a discontinuance of the impressment of seamen. In the latter part of August Mr. Russell received from the English government a definite refusal to accede to these propositions as "on various grounds absolutely inadmissible," and thereupon returned to the United States. In September Admiral Warren arrived at Halifax. In addition to his naval command, he was invested with powers to negotiate a provisional accommodation with the U. S. government. A correspondence on the subject ensued between himself and Mr. Monroe, as the representatives of the two countries. The admiral proposed an immediate cessation of hostilities, with a view to the peaceful arrangement of the points at issue. Mr. Monroe replied that his government was willing to accede to this proposition, provided Admiral Warren was authorized and would agree to negotiate terms for

suspending in future the impressment of American seamen. All negotiations upon this point failed. The British government refused to relinquish the claim, and nothing remained but war.—On March 4, 1818, Mr. Madison entered upon his second term of service. He received 128 electoral votes; his opponent, De Witt Clinton, 89 votes. The congressional elections resulted in a large majority in favor of the administration, and the war policy thus appeared to be acceptable to the great body of the people, though a strong party were bitterly opposed to it, and endeavored to obstruct the measures necessary for the prosecution of hostilities. The contest commenced in earnest with the appearance, in Feb. 1813, of a British fleet in the Chesapeake bay; and in March the whole coast of the United States, with the exception of Rhode Island, Massachusetts, and New Hampshire, was declared in a state of blockade. The long series of engagements on land and water, during the war which followed—the melancholy defeats and glorious victories which alternately marked the contest—find their proper place in the general history of the country. In March, 1813, soon after the commencement of hostilities, the Russian minister to the United States communicated to the American government a proposal from the emperor Alexander to mediate between the belligerents. The proposition was accepted, and the president appointed commissioners to proceed to St. Petersburg, to negotiate under the mediation of the emperor. The effort failed. Great Britain declined the Russian mediation in September; but in November the American government was informed that Great Britain was prepared to negotiate the terms of a treaty of peace. Steps were at once taken to meet this proposal of the English government. Mr. Clay and Mr. Russell were added to the commission previously appointed, and in Jan. 1814, proceeded to Europe and joined their associates. In August of the same year the indignation of the country was deeply aroused by the attack upon the capital. A British force of 5,000 men ascended the Chesapeake, landed on the shores of the Patuxent, and marched upon Washington. The few troops hastily called together were wholly unable to offer any effective resistance, and retired before the enemy, who proceeded to the city, burned the capitol, the president's house, and other public buildings, and returned without loss to their ships. The president and several members of his cabinet were in the American camp, but were compelled to abandon the city in order to avoid capture. The enemy gained little by their movement, and the wanton outrage, so opposed to every rule of civilized warfare, only increased the bitterness of the people. Among the public occurrences of the year 1814, the meeting of the Hartford convention occupies a prominent place. (See *HARTFORD CONVENTION*.) The glorious victory at New Orleans, however, and the intelligence of the conclusion of peace, terminated the popular agitation. A treaty of

peace had been signed by the U. S. commissioners at Ghent, on Dec. 24, 1814, and being communicated by the president to the senate, was ratified by that body in Feb. 1815. It was silent upon the paramount question of the right of impressment, and left the commercial regulations between the two countries for subsequent negotiation. But the country was tired of the war, and the treaty was hailed with acclamation. In this general joy no one shared more sincerely than Mr. Madison. He had acquiesced in the commencement of hostilities with unfeigned reluctance, and had longed for the conclusion of peace. Wanting by nature in those fierce elements of character which mark the military chieftain, he had contemplated only the immense loss of life, the national embarrassment, and the prostration of all the resources of the country which would accompany the contest. There can, however, be little doubt that the war of 1812 was of the greatest benefit to the country in its final results. It proved that the spirit of the revolution lived in the breasts of the people; that American seamen were a full match for the boasted mariners of England; and that in spite of the existence of a powerful party wholly disaffected to the course of the government, the principle of nationality and obedience to law was stronger in the country than all else which could come in conflict with it. Other results were the promotion of domestic manufactures and internal improvements, and the reorganization of the army and navy, which had hitherto been viewed with unwise jealousy and suffered to languish. The country thus came out of a war which cost her 30,000 lives and \$100,000,000, stronger and more honored than before, thoroughly convinced of her own power and resources, and regarded with increased respect by all the nations of the world. In 1815 a commercial treaty was concluded with Great Britain, based upon a policy of perfect reciprocity between the two countries. The subjects of impressment and blockades were not embraced in it. The return of peace disbanded the organized opposition to the administration, and the remainder of Mr. Madison's term of office was undisturbed by events of an exciting character. In April, 1816, congress incorporated a national bank with a capital of \$35,000,000, to continue for 20 years. The president had vetoed a similar bill in January of the preceding year, but now approved of it, from a conviction that the derangement of the currency made such a measure necessary. It encountered strong opposition, but was supported by Mr. Clay and other friends of the administration, and passed successfully both houses. In Dec. 1816, Mr. Madison sent in his last annual message to congress. Its recommendations were considered liberal and judicious, and secured the general approbation of the country.—On March 3, 1817, his long official connection with the affairs of the nation terminated, and he retired to his farm of Montpelier in Virginia. In this pleasant retreat

he passed his days tranquilly in agricultural pursuits and the enjoyment of the society of his friends. He had married in 1794 Mrs. Todd, a Virginia lady, the widow of a distinguished lawyer of Philadelphia; and though their union had not been blessed with children, this amiable and accomplished woman's faithful devotion was a source of the greatest happiness to him. During these years, in spite of his infirm health, Mr. Madison still busied himself in useful services to his neighbors and the commonwealth. He was chosen president of the county agricultural society, and for a long time acted as visitor and rector of the university of Virginia. In 1829 he sat in the Virginia convention to reform the old constitution; and many hundreds of the new generation scanned with eager curiosity the venerable countenance of the octogenarian, whose public career had commenced far back in the days of 1776. The deep interest of the spectators extended to the members of the convention, which embraced the most famous men of the epoch in Virginia. When he rose, after long silence, to utter a few words, the members left their seats and crowded around the venerable figure, dressed in black, with his thin gray hair still powdered as in former times, to catch the low whisper of his voice. This was his last appearance in public. Returning to Montpelier, he passed the rest of his days in tranquil retirement.—The mental and moral characteristics of James Madison are patent on the face of his career. If not endowed with the very first order of ability in comparison with the great men of his times, his mind was yet singularly symmetrical in its proportions, and vigorous in its movements. His range was not equal to that of some others, but an unflinching accuracy and precision marked the operation of his faculties. He was naturally deficient in powers of oratory, and yet made himself one of the most effective public speakers of his time, although the epoch was illustrated in Virginia by such men as Patrick Henry, Richard Henry Lee, George Mason, and Edmund Pendleton. Mr. Jefferson's testimony upon this point is very strong. "Mr. Madison," he says, "came into the house in 1776, a new member and young; which circumstances, concurring with his extreme modesty, prevented his venturing himself in debate, before his removal to the council of state in Nov. 1777. From thence he went to congress, then consisting of few members. Trained in these successive schools, he acquired a habit of self-possession, which placed at ready command the rich resources of his luminous and discriminating mind and of his extensive information, and rendered him the first of every assembly afterward of which he became a member. Never wandering from his subject into vain declamation, but pursuing it closely, in language pure, classical, and copious, soothing always the feelings of his adversaries by civilities and softness of expression, he rose to the eminent station which he held in the great national convention of

1787; and in that of Virginia which followed, he sustained the new constitution in all its parts, bearing off the palm against the logic of George Mason and the fervid declamation of Mr. Henry. With these consummate powers were united a pure and spotless virtue, which no calumny has ever attempted to sully. Of the powers and polish of his pen, and of the wisdom of his administration in the highest office of the nation, I need say nothing. They have spoken and will for ever speak for themselves." The warm friendship felt by the writer of the above for Mr. Madison doubtless colored the expressions; but the estimate is in substance wholly just. From his earliest years Mr. Madison was a hard student. His memory was singularly tenacious, and what his penetrating mind once clearly discerned became assimilated, and was ever after retained. He thus laid up that great store of learning which in the conventions of 1787, and 1788 especially, proved so effective in the enforcement of his views. Clearness of vision was one of the marked traits of his intellect, and laborious practice enabled him to convey his thoughts in the fullest manner. The result was that he exhausted the subject upon which he spoke. When he had finished, nothing remained to be said. His manner of speaking was calm and conciliatory. This was an accurate reflex of the character of his moral nature. Averse by temperament to all extreme and violent views, and disposed to occupy middle ground between contending factions, he never became embittered in the struggle, and treated those who were opposed to him with unaffected courtesy and respect. A marked instance of this may be found in the position which he occupied in congress during the administration of Gen. Washington. Forced to separate himself from Hamilton and the federal party, he indulged in no denunciations, but strove to harmonize the conflicting policies, and, though standing on middle ground, was assailed by neither party. It has been seen that upon more than one great measure he changed his views and his position. An impartial critic will not conclude from this that he was weak or vacillating or mercenary. A similar if not equally defined modification of views characterized some of the greatest minds of the age. The republic was an untried experiment, the political philosophy of the system had yet to be framed, and the leaders of the epoch were compelled to steer the bark without a compass or the lessons of experience. The proper subject of inquiry is the result; and tested by this, the political career of Mr. Madison will not need vindication. After Washington, no public man of his time was more widely respected and beloved by the people. It was his rare good fortune to have a whole nation for his friends. The public confidence in and respect for his well known honesty and singleness of aim toward the good of the country, ripened upon personal acquaintance with them into an affectionate attachment. His bearing and address

were characterized by simplicity and modesty. His dress was uniformly black, and he resembled a quiet student, busy with thoughts of his books, rather than the head of a great nation. He was somewhat taciturn in public, but when he conversed, his tone was weighty and impressive. It was often naked, abstract reasoning; mild, simple, and lucid, but summing up long trains of thought. With his intimate friends, however, the courteous reserve of the public man changed to the genial humor of a boy. He had a strong relish for every thing facetious, and told a story admirably. This sunshine of temperament never deserted him. In the weary hours of pain during his old age, his humor flashed up as spontaneously as before. When some friends came to visit him, he sank back upon his couch with the smiling words: "I always talk more easily when I lie," and during his last illness, while the family and the doctor were at dinner, his voice was heard feebly from the adjoining chamber crying: "Doctor, are you pushing about the bottles? Do your duty, doctor, or I must cashier you." Of Mr. Jefferson he had a long list of stories, which turned the laugh against his friend invariably, to the great enjoyment of the victim himself. In addition to the passage already quoted, Jefferson wrote of Madison: "From three and thirty years' trial I can say conscientiously that I do not know in the world a man of purer integrity, more dispassionate, disinterested, and devoted to pure republicanism; nor could I in the whole scope of America and Europe point out an abler head." Mrs. Madison long survived her husband, and maintained a conspicuous and respected position in society at Washington till her death, July 12, 1849, at the age of 82 years.—See "Life and Times of James Madison," by William O. Rives (vol. i., 8vo., Boston, 1859).

MÄDLER, JOHANN HEINRICH, a German astronomer, born in Berlin, May 29, 1794. In the earlier part of his life he gained a high reputation as a teacher in the principal normal schools of Berlin. Associating himself in 1829 with the astronomical labors of Wilhelm Beer, he published in concert with him the great map of the moon (Berlin, 1834-'6), and the work explanatory of it entitled *Allgemeine vergleichende Selenographie* (2 vols., 1837). In 1837 he was employed on the island of Rügen in chronological observations for the Russian government; in 1836 he was appointed director of the Berlin observatory, and in 1840 of that of Dorpat, Russia, an office which he still holds. Of great influence upon the progress of cosmology were his investigations in regard to the stellar system. Rejecting the hypothesis of the existence of a central body, preponderating in mass, as the universal centre of gravity, he found it in the Pleiades, in the very centre of the group in or near the bright star γ Tauri (Alcyone). This hypothesis has been contested by Encke, Peters, and other astronomers. In addition

to those on the moon, his observations have been devoted to the physical aspects of Mars and Jupiter, to double stars, the determined periods of variable stars, and the centre of gravity of the solar system. Beside his work entitled *Central-Sonne* (Dorpat, 1846), the result of his investigations is embodied in his *Untersuchungen über die Fixsternsysteme* (Mittau, 1847-'8), and in various other publications. Among his most excellent works is his *Populäre Astronomie* (Berlin, 1841; 4th ed. 1849).

MADOC, a Welsh prince for whom the Cambrian chroniclers claim the honor of having discovered America. According to these authorities, Madoc, compelled by civil disturbances to leave his native country, sailed westward in 1170 with a small fleet, and after a voyage of some weeks landed on a continent of exuberant fertility, whose inhabitants differed altogether from those of Europe. After some time he returned to Wales, but left behind him 20 of his crew. He fitted out another fleet of 10 sail, departed again with the intention of revisiting the newly discovered land, and was never more heard of. Humboldt says: "The deepest obscurity still shrouds every thing connected with the voyage of the Welsh chief Madoc, son of Owen Guineith, to a great western land in 1170, and the connection of this event with the Great Ireland of the Icelandic saga. In like manner the race of Celto-Americans, whom credulous travellers have professed to discover in many parts of the United States, have also disappeared since the establishment of an earnest and scientific ethnology, based not on accidental similarities of sound, but on grammatical forms and organic structure." Madoc is the subject of one of Southey's principal poems.

MADONNA (It.), a word originally equivalent in Italy to the French *madame*, and as such used as a title of deference and honor; but now applied almost exclusively to the Virgin Mary, as she is called in other languages Our Lady. The title has also given the name to a great number of pictures in which the Virgin forms the sole or prominent object, such as the *Madonna di San Sisto* or the *Madonna della Seggiola* of Raphael. The "Legends of the Madonna" (8vo., London, 1852), by Mrs. Jameson, describes the manner in which the subject has been illustrated by different painters.

MADOZ, PASCUAL, a Spanish author and statesman, born at Pampeluna, May 17, 1806. His studies at Saragossa were interrupted in 1823 by his part in the defence of the castle of Monzon against the French invading army, and by his imprisonment during 17 months, after which he returned to the university, where he was graduated as doctor of laws; but, expelled on a charge of teaching Jansenist doctrines, he lived for some time at Tours in France. On his return to Spain he became editor of the "Universal Geographical Dictionary," commenced by Bergues (10 vols. 8vo., Barcelona, 1829-'34), and published a "Collection of Celebrated Trials." In 1835 he was appointed judge at

Barcelona, and military governor of the valley of Aran. His spirited operations against the Carlist invaders of Catalonia secured for him the votes of the province of Lerida for the cortes. In 1842-'8 he took a prominent part in the movement against Espartero, on the success of which he was offered a seat in the cabinet and a supreme judgeship, both which he declined. He was afterward, in consequence of political troubles, imprisoned for a short time. In Aug. 1854, he was appointed governor of Barcelona, and having restored tranquillity in that city he resumed his seat in the cortes, where he was the acknowledged leader of the *progresista* party. He was also chosen president of that body. In Jan. 1855, he was appointed minister of finance, and proposed the famous law of *desamortisation*, decreasing the sale of the property vested in the state, the clergy, and other public bodies, which met with great opposition, particularly on the part of the clergy. He retired from the ministry in June, 1855, and was at the head of the opposition in the cortes until July, 1856, when he was compelled to flee on account of his resistance to the cabinet of O'Donnell. Beside the works named, he edited a *Diccionario geografico, estadistico y historico de España* (16 vols. 4to., Madrid, 1848-'50). Of this work he was the publisher as well as editor, having established a printing office at his own expense, and at the same time superintended the sale. He also directed for a time the *Catalan*, an opposition journal.

MADRAS, a presidency of British India, comprising the S. part of the peninsula of Hindostan, bounded N. by the presidencies of Bengal and Bombay, E. by the bay of Bengal, and S. and W. by the Indian ocean. It lies between lat. 8° and 20° N., and long. 74° 30' and 85° 30' E., and is divided into the following 22 districts:

Districts.	Area in sq. m.	Population.
Rajahmundry	4,501	1,012,056
Masulipatam	4,711	520,000
Guntur (including Palnad)	4,758	570,000

	51,902	5,313,671
Total	51,987	5,392,230

The total area of the Madras presidency is thus 184,096 sq. m., and its population 27,753,927. The principal cities and towns are Madras, the capital, Ganjam, Bellary, Bangalore, Calicut, Cannanore, Mysore, Mangalore, Seringapatam, Vellore, Pondicherry, Tanjore, Trichinopoly, and Cochin.—The coast line comprises 540 m. on the Indian ocean and Arabian sea, and 1,187 on the bay of Bengal, but it is almost destitute of good harbors. The estuaries of many of the rivers, however, afford anchorage for small vessels. The N. part of the W. coast is bold and rocky for a distance of about 150 m. What is known as the Malabar coast, stretching S. from Mt. Dilly to Cape Comorin, is generally low and sandy or muddy, and in some parts thickly wooded. To the E. of Cape Comorin, between the mainland and Ceylon, is the shallow and difficult gulf of Manaar, whose shores are low, rocky, and beset with reefs. The Coromandel and Golconda coasts, which lie to the N. present no bold features, and have but 2 or 3 ports, vessels being obliged to anchor in the open sea at some distance from land. The N. E. part of the presidency is occupied by the coast of Orissa, with high rocky headlands and rugged hills. The principal rivers of Madras are the Godavery, Kistnah, Pennar, Palair, Punnair, and Cavery, all of which fall into the bay of Bengal. Those on the W. coast are very numerous, but small. Near their mouths they expand into broad shallow estuaries, or wide lagoons, called backwaters, one of which at Cochin reaches N. and S. a distance of 120 m. —The surface of the interior is diversified, the eastern and western Ghats running nearly parallel with the seaboard, while the S. part of the presidency is traversed by the ridges which connect these two great ranges at their S. extremities. The central and northern parts belong to the great table-land of the Deccan. The soil along the coasts is light and sandy, and inland it is impregnated with salt, which in dry weather appears upon the surface in the form of efflorescence. The climate is generally considered the hottest in India, but it varies greatly with differences of elevation. The table-land, being 6,000 or 7,000 feet above the sea, enjoys a cool and delightful temperature, and even in some parts of the low country the heat is mod-

erated by the regular alternation of the N. E. and S. W. monsoons. The fall of rain in the western Ghats is enormous, the rainy season in certain localities lasting 9 months.—The most important vegetable product of Madras is ship timber, of excellent quality and abundant. More than 100 kinds of trees, including the teak, peon, sandal wood, and cocoa palm, are found in the forests. Rice, maize, millet, ragi (*Eleusine coracana*), oil seeds, pulse, yams, plantains, sugar, tobacco, pepper, and cardamoms are extensively cultivated. The efforts of the British government to introduce the culture of cotton have been attended with success, but the state of agriculture in general is much in need of improvement. The most valuable minerals are iron (in the mining of which a company is largely engaged in Malabar and S. Arcot), copper, manganese, antimony, silver, emery, and lead. Both anthracite and bituminous coal are found on the banks of the Godavery, and gems are collected in various districts.—In a commercial point of view, Madras is the least important of the 8 presidencies. Up to the present time it has had few good avenues of land communication to compensate for its want of harbors; but the Madras railway company has several lines in progress, which will connect the city of Madras with Bombay, Calicut, Bepoor, Bangalore, &c. Portions of these routes have been open since 1856. The foreign trade is chiefly with Ceylon, Great Britain, the Arabian and Persian gulfs, Mauritius and Bourbon islands, New South Wales, France, Penang, Singapore, and Malacca. The imports, arranged according to values, are cotton manufactures, military stores, iron, wearing apparel, wines, fruits, horses, malt liquors, books and stationery, and manufactured metals; and the exports, grain, indigo, cotton goods, raw cotton, sugar, oil seeds, skins and hides, coffee, and spices. The following table shows the movements of shipping in 1855:

Shipping.	Entered.		Cleared.	
	Vessels.	Tonnage.	Vessels.	Tonnage.
Foreign	1,023	388,023	1,799	374,476
Native	3,908	177,605	4,408	311,497
Total	5,426	510,628	6,207	585,973

The imports and exports for the 8 years 1855–7 were as follows:

Years.	Imports.	Exports.
1855	21,281,556	22,068,682
1856	2,201,578	1,085,320
1857	2,540,739	2,407,906

The revenue of the presidency during the year ending April 30, 1858, was £4,580,978, and the expenditures were £5,388,458.—MADRAS, the capital of the above presidency, is situated on the bay of Bengal (Coromandel coast), in lat. 13° 5' N., long. 80° 21' E., 640 m. S. E. from Bombay, and 885 m. S. W. from Calcutta; pop. estimated officially at 720,000, the great majority of whom are Hindoos. There are very few Christians, and most of them are descendants

of Portuguese or of the converts made by Portuguese missionaries. The city extends about 9 m. along the shore, and has an average breadth of $3\frac{1}{2}$ m. reaching down to the beach. It is bounded on the S. by the small river Adyar, which is not navigable; and another rivulet called the Kuam, and a canal which is now navigated by steam, flow through it. The European residents occupy light two-story dwellings in the outskirts or suburbs, with compounds or enclosures around them thickly planted with shade trees. The principal shops are in the quarter called the Black town, which is crossed N. and S. by 8 good avenues. The minor streets, inhabited by the natives, are narrow and dirty. The custom house, some of the courts and other government buildings, and the warehouses and offices of the principal European merchants, are built along the beach; and here too are the principal drive and promenade, and the strong and handsome fortress called Fort St. George, with barracks for troops and a double line of bomb-proof defences on the land side. It has accommodations for 1,000 men. Adjoining it is a fine esplanade, protected from the encroachments of the sea by a stone wall. The principal public buildings of Madras are the government house, mint, exchange, bank of Madras, government savings bank, general and naval hospitals, male and female orphan asylums, post office, the pantheon (comprising a theatre, ball rooms, &c.), St. George's cathedral, St. Andrew's (Scotch) church, the Roman Catholic cathedral, about 20 other places of worship, 7 or 8 of which belong to the established church, one to the American mission, and one to the Armenians, a mosque, and several unpretending Hindoo and Mohammedan temples. The chief establishments for education are a university, comprising primary and high schools, and a college (which is now however virtually extinct), a successful medical school for the natives, a polytechnic institute, and a literary institute. There are agricultural and horticultural societies, a botanical garden, a good museum, and a government observatory. The periodical press comprises 9 or 10 weekly, semi-weekly, and tri-weekly, 2 semi-monthly, 7 monthly, and 2 quarterly publications. Madras is supplied with excellent water from wells in the Black town; it is conveyed in pipes to two reservoirs, and thence distributed through the city. The streets have been lighted with gas since Nov. 1859.—Madras is totally destitute of a harbor. Large ships are obliged to anchor about 2 m. from the beach in 9 fathoms of water, and landing is effected by boats called masulaha, built of thin planks, flat-bottomed, without ribs or keel, and so flexible as to yield to the impulse of the breakers. The greatest skill is required to conduct them through the tremendous surf, in which no boat of ordinary construction could live a moment. Throughout the S. W. monsoon the anchorage is extremely hazardous, and ships are often obliged to cut loose their anchors and put out to sea. The building of a pier was

begun in 1859. An attempt has been made to construct a breakwater, but with no success. Notwithstanding these drawbacks, the commerce of Madras is very large, as appears by the following table:

Years.	Imports.	Exports.
1858.....	£1,110,589	£1,008,877
1854.....	1,384,787	974,338
1855.....	1,014,000	1,048,609

The settlement of Madras dates from 1639, when Mr. Francis Day, chief of the British factory at Armegon, the first English settlement on the Coromandel coast, removed his establishment to this spot, and built Fort St. George on a small tract of territory granted by a native prince. The presidency was created in 1658. The settlement was known at first as Ohenappatam, but in official documents the city still retains the name of Fort George. In 1702 it was blockaded by Daoud Khan, a general of Aurungzebe; in Sept. 1744, after 8 days' bombardment, it surrendered to the French under La Bourdonnais; and in 1768-'9, having reverted to Great Britain by the peace of Aix la Chapelle (1748), it underwent a siege of two months by a large French and native force under Lally. The assailants were finally driven off, leaving all their sick, 52 pieces of cannon, and most of their stores.

MADRAZO, José y Aguda, a Spanish painter, born at Santander, April 22, 1781, died in Madrid, May 8, 1859. He pursued his studies at the academy of Madrid, in Paris under David, and in Rome, where he spent several years, having been sent there by the king of Spain. In 1818, on his return to Madrid, he became director of the academy, and afterward of the museum. His principal works are: "Jesus in the House of Ananias," the "Sacred Heart of Jesus," the "Battle of Cerignola," the "Seizure of Breda," the "Storming of Montefrío," and an admirable portrait of the present empress of France. His sons, Federico and Luis are among the most distinguished living artists of Spain, particularly the former, who was born in Rome in 1815, and excels as portrait painter.

MADRID, the metropolis of Spain, situated in the centre of the peninsula, about 2,000 feet above the level of the sea, on the left bank of the Manzanares, crossed here by magnificent bridges, in lat. 40° 25' N., long. 8° 42' W.; area nearly 5 sq. m.; pop. in 1857, 281,170, including upward of 25,000 foreigners, chiefly French. It is connected with the Mediterranean by the recently opened railway to Alicante *via* Aranjuez and Almansa; distance from the former city 282 m. The projected railway to Bayonne (240 m.) will establish a direct communication between Madrid and Paris. A railway to Valencia is in course of construction, and one to Lisbon (320 m.) is also contemplated. Madrid is placed in the midst of a desert-like region, and even within a short distance from the gates there is hardly any sign of the vicinity of a great capital excepting the fantastic spires of the churches. The barrenness of the environs, the

prevailing sharp E. and N. E. winds, and the excessive cold in winter and heat in summer, render the climate dangerous to persons of delicate constitution, especially to those suffering from pulmonary complaints. A great improvement, however, as far as the supply of water is concerned, is insured by the new reservoir, which is to bring the waters of the Lozoya into the city by an aqueduct 40 m. long, at a cost of about \$5,000,000. Madrid is surrounded by a wall 20 feet high. The 5 principal gates are those of Alcalá, Bilbao, Segovia, Toledo, and Atocha. The best approach to the city is by the Saragossa road, and the *puerta* of Alcalá, which is the handsomest gate of Madrid. The city contains upward of 8,000 houses, arranged like those of Paris for several families on different floors, 500 streets, over 70 squares and places, and numerous fountains and public wells. The streets in the old quarters, built before Madrid was the metropolis, are narrow and crooked, especially in the S. W. part of the city. In the E. and more modern part they are well paved, spacious, and lighted with gas. Nearly in the midst of the capital is the Puerta del Sol, said to have once been the eastern gate, but now an open square, from which the principal streets radiate, that of Alcalá running E. N. E., the Calle Mayor W., that of Montera N., and that of Las Carretas S. The Puerta del Sol, close to the *boles* or exchange, is the daily resort of a vast number of people, uniting the social features of a club with the advantages of a public lounging place. For the want of activity and enterprise of the metropolis, a compensation is afforded here in the discussion of the topics of the day, particularly those of a political and scandalous nature. While the ladies of Madrid see each other in the churches, the gentlemen meet in the Puerta del Sol. It is at the same time the resort of adventurers, beggars, newspaper vendors, and of other persons, among whom the *pretendientes* and *casantes*, or office-hunters, and the *emplemanicos*, or corrupt office-holders, are more or less conspicuous. For the purpose of operating against this central hotbed of agitation in case of emergency, a military post is maintained in the *casa de correos* (post office) on the S. side of the Puerta del Sol. The most fashionable shops are in the streets clustering round this neighborhood. The various mail offices and electric telegraphs are also there, and the custom house is in the vicinity. The Calle de Alcalá, $\frac{3}{4}$ m. in length, is the finest street in Spain, and one of the finest in Europe. Among the other most fashionable streets are those of Montera and Las Carretas, abounding with elegant shops. The largest square, with the exception of the space fronting the palace, is the Plaza Mayor, 430 feet long and 330 broad. The chief streets running into it are those of Atocha and Toledo, the latter passing through the Plaza de Cebada and through the gate to the bridge of Atocha. To the left and outside of the gate of Alcalá is the Plaza de Toros,

where the famous bull fights are held, a large circular structure, about 1,100 feet in circumference, and accommodating from 12,000 to 15,000 spectators. It belongs to the government, and the profits are used for public charities. Here from April to November bull fights take place every Monday afternoon, and sometimes on Sundays. The bulls generally come from the pastures of the Jarama. Beyond the pavements, and yet within the gates of the capital, is the Prado, the Hyde park of Madrid, nearly 2 m. long, and comprising extensive pleasure grounds. Mr. Bryant, who visited the Prado in Nov. 1857, says: "Every afternoon in fine weather at this season, a dense throng of the well dressed people of the capital walk up and down the Prado till the twilight warns them home. They move with a leisurely pace between the colossal lions of white marble which form the fountain of Cybele on the north, to those of the sea monsters of the fountain of Neptune on the south; and then turning, measure the ground over again and again, till the proper number of hours is consumed. The men are unexceptionably dressed, with nicely brushed hats, glittering boots, and fresh gloves; the favorite color of their kids is yellow; the ladies are mostly in black, with the black veil of the country resting on their shoulders; they wear the broadest possible hoops, and skirts that trail in the dust, and they move with a certain easy dignity which is thought to be peculiar to the nation. On these occasions a dress of a light color is a singularity, and a bonnet attracts observation. Close to the walk is the promenade for carriages, which pass slowly over the ground, up one side and down the other, till those who sit in them are tired. Here are to be seen the showy liveries of the grantees and opulent hidalgos of Spain and of the foreign ambassadors." The most frequented portion of the Prado, *el salon*, extends from the Calle de Alcalá to the Calle de San Jeronimo. Other public but less frequented walks are the gardens of the Buen Retiro, the Florida, the Delicias, and Chamberi, the last outside the gate of Bilbao, and a resort of the humbler classes of citizens.—The churches of Madrid are unworthy of notice, except those of San Isidro and of the convent of La Encarnacion. The *iglesia mayor* and the most ancient church, originally a Moorish mosque, is that of Maria de la Almudena. The city formerly abounded with chapels and convents, and still contains over 60; but many have been pulled down or converted to other purposes. Near the Pelota gate are the remains of the convent of San Jeronimo, which was once the Westminster abbey of Spain, but the sepulchres collected there were destroyed during the French invasion. The most conspicuous public building is the royal palace, with two open plazas, that to the E. being called the Plaza del Oriente, occupying with its pleasure grounds nearly 80 acres on the E. bank of the river. The magnificence of the interior is perhaps not surpassed in any palace

of Europe. The ceilings were painted by Velasquez, Mengs, and other eminent artists; the richest marbles and mirrors adorn the walls. Many of the best pictures, however, have been removed to the gallery in the Prado. The armory, occupying the S. façade, contains collections of weapons of all ages, and is peculiarly rich in Moorish arms and accoutrements. The other principal public buildings are the new palace of the cortes, opened in 1850, in the square of the same name; the Buena Vista palace, now used as a museum of civil engineering; and a number of private palaces, the most remarkable of which are those of the dukes of Liria and Alba, with valuable picture galleries, and of the count of Altamira and the banker Salamanca. The royal museum of painting and sculpture, in the Prado, is one of the finest picture galleries in the world, containing the best productions of Murillo, Velasquez, and other great Spanish masters. One long room is almost covered with the works of Rubens; the Titians fill another room; and Paul Veronese is represented here almost as magnificently as in Venice. There are some very fine Guidos, and 10 pictures by Raphael, including his *Lo spazzino di Sicilia*, which is considered the best work in the museum. There are 23 pictures by Van-dyke, a very large number by Teniers, and some of the finest landscapes of Claude Lorraine. The private gallery of Madrazo, who was until his death in 1859 president of the academy of fine arts, contains many works of the highest merit. Among the finest public monuments are an equestrian statue of Philip IV. in the Plaza del Oriente, a statue of Cervantes in the Plaza de las Cortes, and the monument dedicated to the memory of those killed by the French, May 2, 1808.—The hospitals of Madrid are numerous, and include several for foundlings, orphans, foreigners and strangers, and a military hospital. The principal charitable institutions are the royal hospital of San Fernando, resembling an English workhouse; the general hospital in the Calle de Atocha, accommodating nearly 2,000 persons, and also serving as a practical school for the students of the academy of medicine of both sexes; and the mendicity depot for the reception of paupers. Education is promoted by 60 public primary schools, by a number of colleges, and by religious and private institutions. Girls are chiefly educated in convents. The university of Alcalá was transferred to Madrid in 1886, and chairs of medicine, natural history, and astronomy were added to it in 1845. The great national library is in the royal palace, and the library of San Isidro has a large collection of books which formerly belonged to the Jesuits. Madrid possesses a botanic garden; an observatory; a museum of natural history, containing a collection of superb emeralds and fine ores of the precious metals; many learned and literary societies, at the head of which stands the Spanish academy; various establishments for the promotion of music and art; and

9 theatres, comprising the Teatro Real, one of the finest in Europe for the performance of Italian opera, the Zarzuela, for the exclusive performance of Spanish vaudevilles, chiefly adaptations from the French, and El Circo, famous for its scenic entertainments, consisting of the national dances. The number of daily journals is now (1860) about 25, including the gazette of the government. Clubs, coffee houses, reading rooms, cabs, and other conveniences for strangers are increasing in number.—The Madrilenians are noted for their imitation of French tastes, fashions, and modes of living. The higher classes keep late hours, rise late, and breakfast generally on chocolate. After the dinner follows the *siesta*, a season of almost universal repose. The shops are then closed, the windows shut, and scarcely any person is seen in the street; the stall keepers spread cloth over their wares, and even the Galician water carriers sleep upon their water casks. After the *siesta* the ladies lounge in the balconies and the gentlemen are engaged in smoking till the time for the promenade in the Prado, and the *tertulia*, a social meeting for conversation and music closing the day. Indolence is the characteristic of high and low. The workmen of the city are chiefly Catalans, Valencians, Aragonese, Asturians, and Galicians. The manufactures are inconsiderable, and almost all articles of trade and consumption are imported from foreign countries or from the Spanish provinces. Government manufactories exist of porcelain, tapestry, and carriages; but they are supposed to be as little profitable as the public saltpetre works and the mirror manufactory of St. Ildefonso. Butter comes from Aragon, oranges and lemons from Valencia, and dates from Murcia; and the markets are well supplied with fruit. Commerce is paralyzed by the absence of any navigable river and by the uninviting situation of the capital; but the financial operations and the transactions on the stock exchange, chiefly in Spanish securities, are of great importance. The principal bank is that of San Fernando. Notwithstanding the general laziness of the people, they are free from the drunkenness which is to be found among the lower classes in other countries, and highway robberies are comparatively rare, especially since the recent establishment of a police after the system of London. The government is paying more attention to the improvement of the city, and in the budget of 1859 23,000,000 reals were appropriated to public buildings in the Puerta del Sol and 4,000,000 to the mint. The savings bank of Madrid exhibits also a steady increase. In 1849 the deposits from 1,204 persons were \$100,000; in 1859, from 4,865 persons, they amounted to \$400,000.—Madrid is supposed to occupy the site of the Mantua Carpetanorum of the Romans, which was called Majoritum by the Goths and Majrit by the Arabs. The earliest authentic historical record of Madrid does not go back much beyond the early part of the 10th century. Under the rule of the Arabs

was a mere military outpost, which was finally taken from them at the end of that century by Alfonso VI., who annexed it to the bishopric of Toledo, to which it still belongs. It continued to be an insignificant place till the reign of Henry III. of Castile, who resided there during the hunting season, the neighboring mountains abounding then with the wild boar and the bear. It first rose to importance under Charles V., who made it his occasional residence, and Philip II. at last made it his capital and only court in 1560. Madrid was entered by the French under Murat, March 28, 1808; but the heroic rising of the inhabitants (May 2) obliged them to evacuate the city. It was entered by Joseph Bonaparte July 30, and again evacuated Aug. 2. Napoleon finally took possession of it in December following, and King Joseph held it till 1813, when it was restored to Spain by the duke of Wellington.

MADRIGAL, a species of minor poem, having generally fewer verses than the sonnet or roundelay, and, unlike them, subjected to no stringent rules, the poet being allowed to follow his own convenience and fancy in the arrangement of rhymes and verses. With somewhat of epigrammatic terseness, it expresses in simple language tender and delicate sentiments, generally of an amatory or pastoral character, and occasionally ventures upon a higher strain of thought. It was very generally cultivated in Europe from the latter part of the 15th to the commencement of the 18th century, and appears to have been popular among the classical writers of antiquity, many of the shorter pieces in the Greek anthology and the works of Catullus and Martial, which are styled epigrams, being genuine specimens of the madrigal. The etymology of the word is involved in much uncertainty; but there is strong evidence that it is of pastoral origin and a native of southern Europe, although Dr. Burney and others derive it from the words *alla madre*, "to the mother," the beginning of certain hymns to the Virgin, on the supposition that the earliest madrigals were poems of this description; hence *madrialle* and *madrigale*.—In music the madrigal is an elaborate vocal composition in 4, 5, 6, and sometimes 7 or 8 parts, of a rich and sonorous character, somewhat studied in its construction, and comprising imitations, canons, and fugues. Choron calls it a species of composition resembling the fugue, but the style of which, being less dry, admits of every kind of expression. Simple madrigals, which long antedated the opera, were for voices only; after them came accompanied madrigals, performed to the accompaniment of one or more instruments, and which were the immediate precursors of the opera. The former class were originally adapted to sacred words, and the music resembled that written for the church; hence the term spiritual madrigals, of which the celebrated psalms of Marcello, the Venetian composer, afford favorable specimens. From the middle of the 16th to the close of the 17th century, during which both classes were

most extensively cultivated, they assumed a freer style, and in the compositions of Palestrina, Luca Marenzio, Gesualdo the prince of Venosa, Monteverde, Mazocchi, and particularly of Alessandro Scarlatti, adequately interpreted the romantic and impassioned words to which they were adapted. In England during the Elizabethan period they reached a high degree of perfection, and among the prominent madrigal writers of the time may be found the names of Wilbye, Morley, Orlando Gibbons, and other composers, who vied with the best of their contemporaries on the continent. At the present day this species of composition may be considered to have been supplanted by motette, or to have nearly passed away, although in the glee, the catch, and other forms of part songs its influence may still be traced. In England the "Madrigal Society," founded in 1741, has fostered a taste for madrigal music.

MADURA, or **MADOORA**, an island of the Asiatic archipelago, in the Sunda group, N. E. of Java, from which it is separated by a strait from 1 to 2 m. wide; it lies between lat. 6° 10' and 6° 45' S. and long. 112° 45' and 114° 5' E.; area, 1,260 sq. m.; pop. in 1850, 816,370. A chain of low calcareous hills runs through it from N. to S., but there are no high mountains. The geological formation and vegetable products resemble those of Java; the soil is generally poor, and a large part of it is uncultivated. The inhabitants are of the same race as the Javanese, and about on a level with them in point of civilization, but they speak a language of their own in two very distinct dialects, using the Javanese however in writing. They have a nominal sovereign who resides at Bangkallan, but the whole island is virtually subject to the Dutch, who first landed there in 1747. Great numbers of the Madurese have settled on the island of Java, where it is supposed that they number nearly 1,000,000 souls.

MADVIG, JOHANN NICOLAUS, a Danish philologist and politician, born at Svanike, in the island of Bornholm, Aug. 7, 1804. He completed his education at the university of Copenhagen, where in 1829 he was appointed professor of the Latin language and literature. Previous to that time he had acquired considerable reputation for philological learning by the publication of 8 works on the writings of Cicero, many of whose philosophical treatises he subsequently edited. He has also edited the works of Lucretius, Juvenal, and Livy, and in 1829 wrote a pamphlet to prove that the work *De Orthographia* of Apuleius, first published by Mai in 1823, was the work of a literary impostor of the 15th century. His *Opuscula Academica* (3 vols. 8vo., Copenhagen, 1834-'42) contain interesting documents and commentaries on many points in Roman history and antiquities. Among his remaining contributions to philological literature are: a "Glance at the Constitutions of Antiquity," "The Creation, Development, and Life of Language," "On the Fundamental Idea of Ancient Metres," a new "Latin Grammar for

Schools" (translated by the Rev. G. Woods, 4th ed., Oxford, 1859), &c. In political life he has favored the union of the Scandinavian nations, and has also labored earnestly as a deputy in the national diet to promote the interests of the university of Copenhagen. In 1848 he was appointed minister of public worship, which position he exchanged in 1853 for that of general director of public instruction.

MÆANDER (now *Meinder*, or *Boyuk-Meinder*), a river of Asia Minor, rising in Mt. Aulocrenas in Phrygia. It flows in a S. W. direction, and its remarkable tortuousness has caused its name to be used as a common word both in ancient and modern times. After leaving Phrygia, it passes into Caria, and has its outlet between Priene and Myus, in that part of the *Ægean* called the Icarian sea. Its principal tributaries are the Obrimas, Marsyas, Cludrus, Lycus, and Harpassus. The Mæander bears to the sea an immense quantity of mud, which, deposited at its mouth through a succession of ages, has extended the coast outward about 90 or 80 stadia, and joined several small islands to the continent. Its entire length is over 170 m.

MÆCENAS, CAIUS CILNIUS, a Roman statesman, born April 13 in some year between 78 and 68 B. C., died in Rome in 8 B. C. Though his family was only of the equestrian order, it was yet of high antiquity, deriving its descent from the Lucumones of Etruria, and said to number among its ancestors the famous Porcena. Mæcenas received an excellent education, and was well acquainted with Greek and Roman literature. His first connection with Octavius was probably in the capacity of tutor; and almost immediately after the appearance of Octavius on the political stage, we find the name of Mæcenas in frequent conjunction with his, as principal counsellor and minister. The first diplomatic business that Mæcenas conducted was the negotiation of a marriage, in 40 B. C., between Octavius and Scribonia, the sister-in-law of Sextus Pompey. His success in this affair led to his appointment, at a later period of the same year, to represent Octavius at the conference of Brundisium, where peace was made with Antony. During the war with Antony Mæcenas remained at Rome, and administered the civil government of Italy; and after the return of Octavius from the East, it was he who is said to have counselled him to retain the supreme power and establish the empire, while Agrippa was in favor of restoring the republic. The influence of Mæcenas over Augustus, and his participation in the government, still continued for a number of years; and when at length a coolness sprang up between them, he withdrew from the political world to a palace on the Esquiline hill which he had built, and which had long been the principal resort of all the wits and literati of Rome. Whatever may have been the misdeeds of Mæcenas as a patriot or a man, his liberal patronage of learning and genius has secured to him a lasting fame. Among

those who experienced his friendship and generosity, the most distinguished were the poets Horace and Virgil, the former of whom was indebted to him for an estate in the country of the Sabines, and the latter for the restoration of his hereditary property near Mantua, which had been seized by the Augustan soldiery in 41 B. C. Though a man of literary taste rather than of genius, he was nevertheless himself the author of some poems, dramas, and memoirs, all of which have perished save the fragments collected by Lion in *Mæcenatiana* (Göttingen, 1824).

MÆLAR, MALAR, or MÆLAREN, a lake of Sweden, extending from Stockholm on the E. to Koeping on the W., a distance of about 75 m., and comprising an area of about 800 sq. m. Its width is extremely variable. It has numerous arms branching off in all directions, and communicates with the Baltic by a canal called the Soedertelge, and also by a short channel, on the shores and on an island of which stands the city of Stockholm. It contains about 1,400 islands, and is noted for its picturesque scenery.

MÆLSTRÖM (Norwegian, grinding or whirling stream), an ocean current or whirlpool off the coast of Norway to the S. W. of the Loffoden islands, in lat. 67° 48' N. and long. 12° E. It runs between the islands of Værøe and Moskøe, or rather between Moskøe and a large solitary rock which lies in the middle of the strait dividing Moskøe from Værøe. According to the commonly received account of this whirlpool, the roar of its ebb equals that of the loudest cataracts, the noise being heard several leagues off; while its vortex is of such an extent and depth that if a ship comes within its attraction, it is inevitably absorbed and carried down to the bottom, and there beaten to pieces against the rocks, and when the tide changes the fragments are thrown up again. It was said that when the stream was most boisterous, and its fury heightened by a storm, it was dangerous to approach within several miles of it; that boats and ships have been destroyed by not guarding against it before they were within its reach; and that frequently whales came too near the stream and were overpowered by its violence and dashed to pieces in its depths. In the year 1645, says Jonas Ramus, early in the morning of Sexagesima Sunday, it raged with such noise and impetuosity that the very stones of the houses on the coast fell to the ground. Lord Dufferin, who cruised on the coast of Norway in 1856, was assured by intelligent inhabitants of the Loffoden islands that the stories about the Mælström were ridiculously exaggerated. "On ordinary occasions," he says in his "Letters from High Latitudes" "the site of the supposed vortex is perfectly unruffled, and it is only when a strong weather tide is running that any unusual movements can be observed; even then the disturbance does not amount to much more than a rather troublesome race." "Often and often, when she was a girl," said his informant, "had his wife and her sisters sailed

over its fabulous crater in an open boat." Mr. Bayard Taylor, in describing his voyage on the Norwegian coast, also in 1856, says: "According to Captain Rüs and other modern authorities which I consulted, the Maelström has lost all its terrors and attractions. Under certain conditions of wind and tide, an eddy is formed in the strait, it is true, which may be dangerous to small boats; but the place is by no means so much dreaded as the Salten fiord, where the tide rushing in is caught in such a manner as to form a bore, as in the bay of Fundy, and frequently proves destructive to fishing craft. It is the general opinion that some of the rocks which formerly made the Maelström so terrible have been worn away, or that some submarine convulsion has taken place which has changed the action of the waters; otherwise it is impossible to account for the reputation it once possessed." From a statement made in 1859 by Mr. Hagerup, minister of the Norwegian marine, and by Major Vibe, superintendent of the Norwegian hydrographic surveys, who had personally examined the Maelström and made official reports upon it, the real nature of this famous whirlpool appears to be as follows. When the wind is steady and not too violent, boats may venture upon it in summer at flood or ebb tide, when it is still for about half an hour. At the point half way between flood and ebb it is most violent, and boats would then be in danger. At certain times it may be passed at any state of the tide by steamers and by large ships with a steady wind. But in winter and in storms it would be highly dangerous for any vessel to attempt to pass the Maelström. Its direction and violence are in a high degree dependent on wind and weather. When there blows on the sea a storm from the west, the stream in winter runs continually to the east at the rate of 6 knots an hour, without changing its direction with the rising or falling tide; and if at such a time the tide is rising, the stream becomes excessively violent and entirely un navigable for steamers or any other craft. At certain states of the wind and tide in winter the whole stream boils in mighty whirls, against which the largest steamer could not successfully contend. These whirls, however, would not draw vessels to the bottom as was formerly believed, but would destroy them by dashing them against the rocks, or in case of small vessels by filling them and thus causing them to founder. There is no reason to suppose that the Maelström has been changed by any convulsion, or by the wearing away of the rocks. The official report further states that strong currents are very common on the Norwegian coast, and some of them are still more violent than the Maelström, though they do not, like that, have different courses at different points. One of the best known is Saltstrømmen, between Strømmen and Knapplunde, in Salten fiord in Nordland. This is a narrow sound about 900 feet broad, which connects Skierstad fiord, 30 miles long, with Salten fiord, and from the violence and turbulence of its currents this channel is often

utterly impassable. The current also between the islands Værøe and Røst is very violent, and the direction of the stream goes the whole round of the compass in the course of 12 hours.

MAERLANT, JAKOB, a Dutch poet, born in Flanders about 1285, died in Damm, near Bruges, in 1300. His earliest poems, the "Trojan War," and "Alexander," imitations of the French romances of chivalry, are yet unprinted. He afterward devoted himself to the elaboration of biblical subjects, ecclesiastical and secular histories, or purely didactic themes. He is styled the father of Dutch poetry. Among his metrical productions are a life of St. Francis, in which he follows the Latin of Bonaventura (published by Tideman, Leyden, 1848); the *Heimelijkheid der Heimelikheden* (Dort, 1838), after the *Secreta Secretorum* falsely ascribed to Aristotle; *Wapene Martijn* (Antwerp, 1496; Dort, 1834), a dialogue between the poet and his friend Martin on the course of the world and various important questions; and *Van den Lande van Oerree*, an appeal for the deliverance of the Holy Land from the Saracens. He completed in 1270 a version of the Bible, and began in 1288 his *Spiegel historiel*, a chronicle of the history of the world, which was continued by others after his death. Portions of it have been printed (Leyden, 1784-'5; Amsterdam, edited by Bilderdijk, 1812). He was also a sculptor and painter.

MAES, or MAAS, NICOLAS, a Dutch artist, born in Dort in 1632, died in 1698. In his youth he went to Amsterdam and entered the school of Rembrandt, under whose instruction he became an excellent colorist. He painted small historical subjects, and subsequently portraits. His cabinet pictures are very scarce and bring high prices. His portraits are distinguished by vigor of coloring and skilful relief.

MAESTRICHT (Dutch, *Maastricht*), a city of Holland, capital of the Dutch portion of Limburg, situated on the left bank of the Meuse, 110 m. S.E. from Amsterdam, 56 m. E. from Brussels, and 14 m. N. by E. from Liège; pop. in 1854, 24,894. It is connected by a stone bridge 500 feet in length with the suburb of Wyck and the citadel of Petersberg on the opposite side of the river. Maestricht stands on a plain enclosed by hills, and, including the suburbs, is nearly circular in form. It is surrounded by walls and ditches, and is considered one of the strongest fortresses of Europe. Its principal defence consists of detached bastions and the fortress of Petersberg, which stands on a hill in the neighborhood of the city. The most remarkable objects of interest in Maestricht are the subterranean quarries under this hill, which cover a space of 18 m. by 6 m., the number of passages amounting to 16,000, 20 to 50 feet high and 12 broad. By means of sluices the surrounding country can be easily laid under water. The town is well built, and has wide and clean streets. The town hall is considered one of the finest edifices in Holland. There are 9 churches, 6 of which are Roman

Catholic and 3 Calvinistic, 4 hospitals and orphan asylums, and a public library. The manufactures are of woollen and cotton stuffs, leather, soap, tobacco, firearms, beer, and spirits. The city is connected by railroad with the principal cities of Belgium and Prussia. Maestricht has sustained many sieges. It was taken by the Spaniards in 1579, and most of the people massacred. Louis XIV. took it in 1678, and it was afterward unsuccessfully besieged by William of Orange. The Belgians attacked it in 1830 without success.

MAFFEI, FRANCESCO SCIPIONE, marquis, an Italian author, born in Verona, June 1, 1675, died there, Feb. 11, 1755. He was educated at the college of Parma. In 1698 he went to Rome, applied himself to poetry, and was received into the academy of Arcadians. He joined his brother Alessandro in the Bavarian service in the war of the Spanish succession, and was engaged in the battle of Donauwörth in 1704. His rank and accomplishments introduced him to the most cultivated society of Italy on his return. His acknowledged personal bravery gave dignity to his denunciation of the practice of duelling in his treatise *Della scienza chiamata cavalleresca* (Rome, 1710). He was one of the founders in 1710 of the *Giornale dei letterati*, the first literary journal in Italy, one of the objects of which was to acquaint the Italians with foreign literature. He aided in the reformation of the Italian theatre by his *Trattato dei teatri antichi e moderni*, and still more by his tragedy *Merope* (1718), which was received with great applause, and was declared by Voltaire worthy of the most flourishing period of Athens. His comedy *La cerimonia* was also successfully represented. The discovery of manuscripts in the cathedral of Verona directed him to archaeological studies, and in 1781 he published his *Verona Illustrata*, abounding in antiquarian, literary, and historical details, written with a critical spirit and in an elegant style. He had a European reputation when in 1782 he began his travels in France, England, Holland, and Austria, collecting in France the materials of his *Gallie Antiquitates* (Paris, 1788). In England he was received at the court of George III., became a member of the royal society, and had the degree of LL.D. conferred on him by the university of Oxford. Among his works were 8 treatises against the prevalent belief in magic. He had a controversy with the Jansenists, through whose influence he suffered a brief exile when 70 years of age. A bust was raised to his honor by the academy of Verona during his life. His collected works were published at Venice in 1790, in 21 vols.

MAFFITT, JOHN NEWLAND, an American clergyman, born in Dublin, Ireland, Dec. 28, 1794, died in Mobile, Ala., May 28, 1850. He became a preacher in the Wesleyan connection in Ireland, and early gave promise of those remarkable powers as an orator that characterized him in after life. He came to the United States in 1819, and was admitted into the New

England Methodist Episcopal conference. During the 12 years that he remained in this conference he was appointed to some of the most prominent Methodist churches. At the expiration of the above period he removed to New York and took a local relation, travelling at his own discretion, and preaching, lecturing, and delivering addresses in various parts of the country. In 1833, conjointly with the Rev. L. Garrett, he issued in Nashville, Tenn., a weekly journal, entitled "Western Methodist," which has been continued under various names until the present time, the last being that of "The Christian Advocate," the central organ of the M. E. church, South. His labors as a preacher in the West and South were attended with great success. Wherever he went immense crowds were attracted to his ministry. In 1837 he was elected to the chair of elocution and belles-lettres in the La Grange college, Ala., which post he held until he was elected chaplain to congress in 1841. His residence was afterward mainly in the Atlantic cities until 1847, when, by misfortune growing out of a second marriage, he was obliged to leave for the South, and took up his residence in Arkansas, where he labored with some success for 2 years, at the expiration of which time he went to some of the chief cities of the South. The difficulties under which he labored pressed heavily upon his spirits, and he sunk under them. The power which he had over the masses, who had flocked in crowds to his ministry in other years, was gone, and after a brief period he died of a disease of the heart. His conduct was not always governed by due discretion, and his want of it in some instances brought obloquy upon him. Beside fugitive contributions to the press, he left an "Autobiography," "Calvary Tokens," and an "Oratorical Dictionary."

MAGADOXO, or MUKDISHA, an Arabian town on the E. coast of Africa, in lat. 2° 2' N., long. 45° 25' E., subject to the imam of Muscat; pop. 5,000. It is a place of considerable trade, being frequented by Arab and Indian vessels and a few European ships, and by caravans bringing grain, ivory, hides, horses, and slaves from the Galla countries to the west of it. Its imports are chiefly sugar, dates, firearms, and salt fish. The town is surrounded by a wall, and contains a mosque and about 150 houses of stone, the rest of the buildings being of wood. Magadoxo was a considerable town, strongly fortified, when in 1498 it was bombarded by the Portuguese squadron commanded by Vasco da Gama. It was subsequently subject to Portugal.

MAGALHAENS, or MAGELLAN, FERNANDO, a Portuguese navigator, born in Oporto in the latter half of the 15th century, killed at Mactan, one of the Philippine islands, April 27, 1521. Entering the Portuguese navy at an early age, he served for 5 years in the East Indies under Albuquerque, and participated with distinction in the siege of Malacca in 1511. Discontented with the inadequate recompense which he received for his services, he withdrew about 151

with one Ruy Falero, a learned Portuguese astronomer, to Spain, where he made proposals for new discoveries to Cardinal Ximenes, the prime minister of Charles V. Believing with Columbus that it was possible to get to the East Indies by sailing westward, he succeeded in persuading the Spanish court that the Moluccas or Spice islands, then a much coveted possession, might be reached by a vessel taking that course, and thus be claimed by Spain in accordance with the compact between Spain and Portugal that all countries discovered 180° west of the Azores should belong to Spain, while all that were discovered east of that line should be the property of Portugal. A fleet of 5 vessels of from 60 to 130 tons, manned by 234 persons, was accordingly equipped, and under the command of Magalhaens sailed from Seville, Aug. 10, 1519. Making the coast of Brazil in the middle of December, he steered southward and entered the river La Plata; but finding that it was not a strait, he proceeded again to the southward as far as a harbor on the coast of Patagonia, lat. 49°, which he called Port San Julian. While wintering here he repressed with great decision, though perhaps with unnecessary cruelty, a conspiracy among the 4 other commanders of his squadron, who were Spaniards, and who hated him for being a Portuguese. Two of them were hanged, another was stabbed, and the 4th, with a priest, his accomplice, turned out of the ship and abandoned to the mercies of the Patagonians. Magalhaens quitted Port San Julian in Aug. 1520, having first taken possession of the country in the name of the king of Spain, and, proceeding still southward, on Oct. 21 entered the strait dividing the island of Terra del Fuego from the continent of America, which he called the strait of the Eleven Thousand Virgins, but which has ever since borne his name. On Nov. 28 the strait was cleared, and the fleet, now reduced by the desertion of one ship and the loss of another to 3 vessels, put forth into the vast expanse of sea beyond, to which, on account of the smoothness of its waters and the steady and gentle breezes which prevailed over it, Magalhaens gave the name of Pacific. They sailed over this untraversed ocean during the space of 3 months and 8 days, seeing no land but 2 sterile islands, and being gradually reduced to great hardships through disease and want of food. At length, on March 6, 1521, the fleet reached a group of islands, which, on account of the thievish propensities of the natives, Magalhaens called the Ladroneas, and on the 18th came in sight of Pamar, the first seen of the Philippine islands. Both groups were taken possession of in the name of the king of Spain, the latter being named by Magalhaens the archipelago of San Lazaro. According to the account of Pigafetta, the historian of the expedition, the natives of Zebu, at which the squadron arrived on April 7, and of several other islands, were converted to Christianity by the efforts of Magalhaens. Wishing to extend the field of conversion and subjugation,

he landed with 60 armed Spaniards upon the little island of Mactan, whose chieftain refused baptism. The islanders to the number of 1,500 opposed him with vigor, and Magalhaens, having exhausted his ammunition, commenced a retreat to his boats, in the course of which he was killed. The survivors of his party gained the ships with difficulty, and the expedition, reduced finally to a single ship and 18 men, reached Spain in Sept. 1522, under the guidance of Juan Sebastian Cano. This vessel, the Vittoria, was the first to make the circuit of the globe. In boldness of conception, in confidence in his opinions, and in patience and intrepidity, Magalhaens is justly considered to rank as an explorer next to Columbus, though necessarily at a long interval. His voyage from Spain to the Ladroneas, lasting 533 days, while that of Columbus to the nearest American land was of but 70 days' duration, was far the more perilous and arduous of the two; and although on this occasion he only made half the circuit of the earth, he is fairly entitled to the credit of being the first circumnavigator, from the fact that he had previously sailed from Europe to the eastward as far as Malacca, and perhaps still further. Possessing many of the qualities necessary to govern men, he was at the same time cruel and fanatical, and his death in a useless affray was the result of a rashness which frequently mastered his judgment.

MAGDALEN, MARY. See MARY MAGDALEN.

MAGDALENA, a N. department of New Granada, bounded N. and N. W. by the Caribbean sea, extending between lat. 7° 30' and 11° 40' N. and long. 72° 30' and 76° 5' W.; area estimated at 54,000 sq. m.; pop. 253,521. On the coast are the bays of Magdalena, Cartagena, and Morosquil. On the E. are several lateral ranges belonging to the Andes; elsewhere the surface is low. It is divided into the 4 provinces of Cartagena, Santa Marta, Rio Hacha, and Mompox.

MAGDALENA. I. A river of New Granada, which rises in the Andes near the frontier of Ecuador, in lat. 2° N., long. 76° 25' W., and after a sinuous course of 900 m. enters the Caribbean sea in lat. 11° N., long. 75° W. Its principal affluents are the Cauca, Bogota, and Sogamoso. The current is rapid and navigation difficult, but it is a route of considerable traffic, being the main channel of communication between the interior and the sea. It is navigable for small steamers to Honda, 540 m. from its mouth and 60 m. from Bogota, where further navigation is obstructed by cataracts. II. A river of Bolivia, called also Ubahy, Branco, and San Miguel. It issues from Lake Ubahy, in lat. 18° 20' S., and in its early course is called the Chiquitos. After flowing nearly N. about 500 m. it falls into the Guapore, in lat. 12° 20' S., long. 65° 5' W.

MAGDEBURG, a Prussian fortress, capital of the Prussian province of Saxony, on the left bank of the Elbe, 89½ m. by railway S. W. from Berlin, 78 m. N. N. W. from Leipzig, and 800

m. N. W. from Cologne; pop. in 1858 of the town proper, consisting of the Altstadt, Stern, Citadelle, and Friedrichstadt, 58,694, exclusive of 4,000 troops; and including the two suburbs Neustadt and Sudenburg, 76,116. The Altstadt, or the principal part of the fortification, extends along the river, and comprises 11 bastions. South of the Altstadt is the *Sternechanes* or star bastion, outside the Sudenburg gate, which is considered one of the strongest points. The two are connected by Fort Scharnhorst; and on an island of the Elbe, opposite the Altstadt, and united to it by a bridge, is the citadel, which serves also as a state prison, and in which Lafayette and Carnot were confined. Another bridge leads to the Friedrichsstadt or *Thurm-schanze* (tower bastion), on the opposite or right bank of the river. The most remarkable of the 10 Protestant churches of Magdeburg is the cathedral, one of the finest Gothic monuments in N. Germany, surmounted by two towers about 350 feet high, with a nave 110 feet high, a pulpit of alabaster, now sadly mutilated, 45 smaller altars, with a great variety and beauty in the Romanesque capitals and tympana, and containing the bronze statue of Archbishop Ernest, the tomb of its founder, the emperor Otho the Great, and relics of Gen. Tilly. In St. Sebastian's church is the grave of Otto von Guericke, the inventor of the air pump. The equestrian monument of the emperor Otho in the Alte Markt, opposite the town hall, erected after his death at the end of the 10th century, is the oldest in the town. Luther once spent a year at the Franciscan school of Magdeburg, supporting himself by singing in the streets. Magdeburg is connected by steamers with Hamburg, and by railways with the principal towns of Europe. A canal commencing 20 m. below the town unites the Elbe with the Havel. The principal manufactures are beet root sugar and chemical products.—Magdeburg is of very ancient origin, and had the privileges of a town in the time of Charlemagne. A Benedictine convent was established there in 937 by Otho the Great, and an archbishopric in 967, which was raised by Pope John XIII. to the rank of primate of Germany. On account of its being among the first to embrace the reformation, the town was excommunicated, and was taken by the elector Maurice of Saxony in 1551 after a protracted siege. During the 30 years' war Magdeburg was subjected to great trials. It resisted the army of Wallenstein for 7 months, but was taken by the cruel Tilly in May, 1631, who carried it by assault and massacred 30,000 of the inhabitants without distinction of age or sex, reducing the town to ashes, excepting the cathedral and about 140 houses. In the despatch in which he announced the capture he wrote: "Since the destruction of Jerusalem and Troy such a victory has not been." Upon the house of the commandant, whom he beheaded, may be still read the words: "Remember the 10th of May, 1631." By the peace of Westphalia of 1648, the archbishopric of Magdeburg was allotted to the house of

Brandenburg. In 1806 the fortress, then garrisoned by a large force, was basely surrendered to the French by Gen. Kleist after 14 days' siege. The last siege was the obstinate one which it endured in 1818–'14.

MAGELLAN, or MAGALHAENS, a strait separating the continent of South America from the island of Terra del Fuego. Its entrance to the E. is between Cape de las Virgenes on mainland, lat. 52° 18' S., and Cape Esp. Santo on the largest island, lat. 52° 42' S., 80 m. in breadth. On the W. the entrance is between Cape Victory, lat. 52° 16' S., and de los Pilares, lat. 52° 46' S., 83 m. wide. The total length is about 800 m., extending between long. 68° 20' and 75° W. The strait varies greatly in width, contracting at Cape O. to 1½ m. The coasts are high and bold, rising to an elevation occasionally of 2,000 to 3,000 feet, and the navigation is difficult. It was discovered by the Portuguese navigator Ferno Magalhaens in 1520.

MAGENDIE, FRANÇOIS, a French physician and physiologist, born in Bordeaux, Oct. 1783, died Oct. 8, 1855. He was removed at an early age to Paris, and became the pupil of the celebrated surgeon Boyer. At 20 years of age he was appointed successively *aide d'anatomie* in the faculty of medicine, and demonstrator. He, however, subsequently devoted himself principally to the practice of medicine, and in 1819 elected a member of the academy of sciences, and in 1831 succeeded Recamier in the chair of anatomy in the college of France, which he retained until his death. As an experimenter in physiology he occupied a high position, and his experiments on living animals were at one time so numerous and involved much suffering to the animals, that the French government deemed it necessary to interfere. The results obtained, however, were of great importance, if they do not absolve him from the charge of cruelty. Among them may be named an original demonstration that the two roots of the spinal nerves are devoted to two separate functions; that the veins are organs of absorption; that strychnine acts upon the spinal cord and contracts by tetanic spasm the nerves of respiration, thus inducing asphyxia; that a diet destitute of nitrogen is not nutritious; and that prussic acid is a valuable remedy in certain forms of cough arising from irritation in the lungs. By means of numerous experimental researches upon the functions of the brain, parts and nerves, he also greatly aided others in arriving at correct conclusions respecting the parts of the physical economy. He was a valuable author of medical works, the most important of which are: *Formulaire pour la prescription et emploi de plusieurs nouveaux médicaments* (1821), containing an account of the effects of certain plants then recently introduced into the materia medica, and which has been translated into all the languages of Europe; *Précis élémentaire de physiologie* (1816)—for many years an important manual for

its; *Leçons sur les phénomènes physiques de vie* (1836-43); *Leçons sur les fonctions et les lésions du système nerveux* (1839); and *Leçons le sang* (1839). He was also a contributor to the *Encyclopédie des gens du monde*, and to several medical dictionaries.

MAGENTA, a town of Lombardy, situated but 5 m. from the E. (left) bank of the Ticino, 15 m. W. from Milan, with which city it communicates by railway and canal; pop. about 100. It is the first stage on the road from Paris to Milan, being nearly equidistant from the two places. On June 4, 1859, a great battle was fought here between the allied French and Sardinians, under the emperor Napoleon III. and King Victor Emanuel, and the Austrians commanded by Count Gyulai. The French assembled at Alessandria, having first deceived the Austrians by a march toward the E. in the direction of Piacenza, suddenly crossed the Po at Casale (May 31), and, while the Sardinians harassed the enemy's position at Mortara, midway between the Po and Ticino, moved toward the N., occupied Novara, and threw 3 bridges across the Ticino at Turbigo, about 8 m. above Magenta. The Austrians thereupon withdrew across the river into the Lombard territory and fortified the bridge of Buffalora, over which passes the road from Novara through Magenta to Milan; but on June 2 they were compelled to retire before a French corps under Gen. Espinasse, after an unsuccessful attempt to destroy the bridge. On the 4th McMahon's corps, followed by a division of the imperial guard and a division of the Sardinian army, having crossed at Turbigo, marched along the left bank toward Magenta, while the emperor in person advanced with the grenadier division of the imperial guard to occupy the bridge of Buffalora, having orders for Canrobert to follow. The latter was delayed, but the grenadiers began the contest unassisted at noon, and after 2 hours' desperate fighting captured the position and took possession of the heights on the canal, in the face of an Austrian force estimated by the French at 125,000. Gyulai at once despatched Baron Reischach to retake the bridge, but after a conflict of 2 hours more, in which it was 7 times taken and lost, the arrival of Canrobert, Regnault de St. Jean d'Angély, Neil, and Vinoy, turned the scale in favor of the French, though not until great loss had been suffered on both sides. The 3d Austrian army corps was ordered up from Abbiate Grasso on the S., and assailed the French flank with much spirit, but was finally compelled to fall back upon Robecco. In the mean time McMahon's advance from Turbigo had been several times checked by the enemy, who on evacuating Buffalora concentrated the principal part of their force between Milan and Magenta. A large detachment attempted to separate the divisions of La Motte-Rouge and Espinasse, but was finally driven back by the voltigeurs of the guard under Gen. Canon, while the 45th regiment of the line made a heroic and successful attack upon a farm

house defended by 2 Hungarian regiments, and Gen. Anger planted a battery of 40 guns on the railway, from which he poured a tremendous fire upon the Austrians in flank. On reaching the town of Magenta, McMahon found it occupied by 7,000 of the enemy under Clam-Gallas, and the 2d army corps under Prince Liechtenstein. The combat here was terrible. Both sides felt Magenta to be the key of the position, and the attack and defence were conducted with equal bravery and determination. The French took it house by house, losing by their own account 1,500 men, but making 5,000 prisoners and placing 10,000 Austrians *hors du combat*. At 8½ P. M. Gyulai ordered a general retreat, leaving 4 guns in possession of the French. His official report gave his own loss at 9,718 killed, wounded, and missing, and that of the enemy at 6,000 or 7,000 killed and wounded. The French accounts acknowledge a loss of 4,957, and estimate that of Gyulai at 20,000, including 7,000 prisoners. The French generals Espinasse and Clerc were among the killed. The immediate results of the battle were the evacuation of Milan by the Austrians and its occupation by the allies. McMahon and St. Jean d'Angély were rewarded with the batons of marshals of France, and the former was also created duke of Magenta.

MAGGIORE, LAKE. See LAGO MAGGIORE.

MAGI, the priestly caste of the ancient Persians. It has generally been held that they were a Median race, and that the revolution which gave them their supremacy was a Median outbreak. It is, however, believed by Rawlinson that Magism was the old Scythic religion, which maintained itself in Persia after the Aryan conquest, and grew in power and influence despite the frowns of the court until Gوماتes, a Magnus, was raised to the throne as successor of Cambyse. He was speedily overthrown and slain by Darius Hystaspes, and the Aryan religion was restored in triumph over Magism. Zoroaster was the reformer of Magism, which became the later Persian religion. The wisdom of the Magi caused a secret knowledge of religion and philosophy to be ascribed to them.

MAGIC, as explained by its adepts, the traditional science of the secrets of nature, embracing all knowledge, and constituting the perfection of philosophy; also the art of exercising preternatural powers by means of occult virtues and spiritual agencies. Its highest professors have always claimed that it is chiefly esoteric, a *sanctum regnum*, fit only for kings and priests; and that to become master of its secrets requires superior intelligence enlightened by the severest study, an audacity which no peril can daunt, a will which no resistance can bend, and a discretion, devotion, and habitual silence undisturbed by the temptations of the world. They affirm that the reason, imagination, and will of man are instruments of incalculable power, and that some of their resources are known only to the magician; and they refer to Hermes Trismegistus, Osiris, Orpheus, Apollonius of Tyana, and

others, as persons of extraordinary attainments in magical arts, who have consequently been adored and invoked as gods after their death. Paracelsus inveighs against such as rank true magicians with conjurers, necromancers, and witches, "those grand impostors who violently intrude themselves into magic, as if swine should enter into a fair and delicate garden." Cornelius Agrippa reckoned 5 different kinds of magic. These, however, may be reduced to 2, the white or divine and the black or infernal magic. In the former, the devil devotes himself to the magician; in the latter, the magician devotes himself to the devil. The sorcerer, or practiser of the black art, differs from the true magician as the charlatan from the adept. The arts of magic are founded upon a pretended system of the universe, and have their root in astrology. Beside the 4 elements, fire, air, earth, and water, each with diverse potential characteristics, a 5th essential and superior element is introduced, variously called the astral light, the soul of the world, and the primum mobile, which is the grand arcanum of transcendental magic, the Tetragram of the Hebrews, the Azoth of the alchemists, the Thot of the gypsies, and the Tarot of the cabalists. By this element, which abounds in the celestial bodies and descends in the rays of the stars, every occult property is conveyed into herbs, stones, metals, and minerals, making them solary, lunar, jovial, saturnine, mercurial, &c., according to the planetary influences. Every thing human is represented in it, according to the Platonic notion, as Agrippa maintains, that every thing below has a celestial pattern. In it thoughts are realized, and images of past persons and things preserved, so that spectres may be evoked from it and the mysteries of necromancy accomplished. It is thus because they are merely spectral that spirits are said never to cast shadows. The signs printed in it are reproduced on all bodies, men having the signs of their star on their brow and in their hands, by which their destiny may be read from the beginning. Hence the astral cabalistic alphabet of Paracelsus and Gaffarel. Separated and extracted from matter, it is the philosopher's stone and the elixir of youth. To have command of this element, to direct its currents and to discern its moving panorama, is the highest attainment and the incommunicable secret of the magician. To reveal it is to lose it; to impart it even to a disciple is to abdicate in his favor. According to Eliphas Levi, one of the most erudite recent writers in illustration and defence of magic, the famous prophetic dinner related by La Harpe, at which Cazotte before the outbreak of the French revolution foretold to his listeners its horrors and precisely their own mode of execution, has never been correctly understood. According to him, all the men present at the dinner, except La Harpe, had been initiated into societies of magic and illuminism, and had profaned the mysteries. Cazotte had advanced further than they in the scale of initiation, had a higher au-

thority, and therefore in condemning them to the penalty of death was pronouncing their sentence rather than predicting their future. The powerful association only availed itself of the course of events to rigorously execute the sentence. A fundamental principle of magical science is the universal mutual relation of every thing in nature, the necessary chain of all effects and all causes, the slightest event being often momentous with the greatest consequences. Thus, from occult relations, Cæsar is said to have been assassinated because he blushed at being bald; Napoleon to have died on St. Helena because he liked the poems of Ossian; and Louis Philippe to have been dethroned because he possessed an umbrella. These hidden connections are symbolized in magical numbers and words, and are revealed by fantastic but scrupulous ceremonies.—The ultimate magical force, however, is the will; and ceremonies, vestments, perfumes, numbers, written characters, and symbols are useful only as means of educating and concentrating the will. All the mysteries of magic, all occult gnostical symbols, all the cabalistic keys of prophecy, are summed up in the pentagram or flamboyant 5-pointed star, the sign of the microcosm and of intellectual autocracy, and the most powerful magical instrument. This mysterious figure must be consecrated by the 4 elements, breathed upon, sprinkled with water, and dried in the smoke of precious perfumes; and then the names of great spirits, as Gabriel, Raphael, Oriphiel, and the letters of the sacred tetragram and other cabalistical words, are whispered to it, and are fantastically inscribed upon it. In magical ceremonies, which must always be performed with minute exactness, it is placed on the altar of incense under the tripod of invocation. The operator should also wear it on his person together with the figure of the macrocosm, a star of 6 rays, composed of two triangles crossed and interlaced. In various positions it invokes good or bad spirits, and expels, retains, or captures them. Occult qualities are due to the agency of elemental spirit. The magician can become their master only by surpassing them in courage in their own elements. The terrors of initiation into ancient mysteries and mediæval magical rites were designed to test and prove the strength and daring of the candidate. The man who has demonstrated his fearlessness amid conflagration, shipwreck, tempest, and darkness, terrifies the salamanders, undines, gnomes, and sylphs into obedience, and can then evoke them from the fire, water, earth, and air. There are divers modes of divination by the 4 elementary substances, called respectively pyromancy, hydromancy, geomancy, and aeromancy. The magician should be impassible, sober, chaste, disinterested, inaccessible to prejudice and terror, and without physical defect. An impassioned ecstasy may sometimes have the same power as this absolute intellectual superiority, but is not to be depended on. He should not live exclusively in his laboratory, with his

Athanasius, elixirs, and crucibles. The intense mental concentration required by every magical operation should be followed by a period of repose. It is claimed that a traditional key to magical arts has been preserved from the time of Solomon, its use being permitted only to the highest priests and to the élite of the initiated. This key is a hieroglyphical and numeral alphabet, expressing by characters and numbers a series of universal and absolute ideas. It has 4 symbols bound together by 12 figures, representing the 4 great geni of the 4 cardinal points united by the 12 signs of the zodiac. The symbols of this key with all their analogies explain all mysteries, the ancient magic, the cabala, and the 7 magical planetary squares of Agrippa and Paracelsus. To its 24 letters correspond the 22 keys of the cabalistic Tarot, explained by Court de Gébelin, and known to the Rosicrucians and the Martinists. Thus revealed, the Tarot is a veritable oracle, and of itself would furnish a universal science and an exhaustless eloquence. It was the great secret of Raymond Lully. The celebrated word *abracadabra* formed the magical triangle of pagan theosophers, to which extraordinary virtues were attributed. It symbolizes the whole magical sciences of the ancient world. The trident of Paracelsus was believed by him to have all the virtues which the cabala attributed to words, and which the hierophants of Alexandria ascribed to the *abracadabra*. A complete knowledge and mastery of nature is the transcendent claim of magic. To know things secret and future, to command the elemental spirits, to heal the sick, to provide charms and talismans which shall mysteriously sway the will of others, render one's self invulnerable, and raise tempests, to constrain the devil into service, to evoke the dead, to possess the philosopher's stone and the elixir of life, are the usual objects of magical arts. The highest success can be attained only by the most disinterested purposes and the most unswerving devotion. Thus those who have been believed to have possessed the secret of making gold, as Nicholas Flamel, passed lives of poverty and privation, while they made princely distributions of wealth.—Though magic has generally ceased to be an object of serious attention, being regarded by enlightened nations as a chimerical science, yet it has had a history which links it on the one hand with the highest themes of symbolism, theosophy, and early science, as well as on the other with the ridiculous or tragical delusions of the many forms of demonomania. It played an important part in the religious doctrine and ritual of the ancient Persians, and magical arts have always remained in vogue and authority almost throughout the East. The Greeks borrowed the name from the Chaldeans, and applied it to all divinations and thaumaturgy. Schelling in his work on the divinities of Samothrace suggests that "in the Greek mythology the ruins of a superior intelligence and even of a perfect system were to be found, which would reach far beyond the

horizon which the most ancient written records present to us." He adds that portions of the same system may be discovered in the Jewish cabala. The Alexandrian philosophy, which mingled the ideas of the East and the West, attached importance to magic, under the influence of which theurgy became a prominent part of the declining pagan doctrine. The Mosaic law had recognized and proscribed magical arts, and Christianity renewed the interdiction, ascribing its marvels to malignant spirits. Magic in connection with fantastic Neo-Platonic theories was the last remnant of paganism, and was practised in secret. To its long and hidden culture under proscription, the mediæval conception of the sabbat, or midnight assembly of witches, has been attributed. Celtic, Germanic, Latin, and oriental ideas all combine in the Christian history of magic. To the mediæval mind, Aristotle, Virgil, Solomon, and Alexander the Great were alike magicians and enchanters. Gerbert, who was afterward Pope Sylvester II., scarcely escaped condemnation for sorcery. Albertus Magnus, Roger Bacon, Raymond Lully, and Pico della Mirandola studied the cabala and prosecuted original inquiries. Faust enjoyed unrivalled celebrity in Germany. Near the time of the renaissance appeared the Rosicrucian theory of sylphs, gnomes, undines, and salamanders, and their various powers. The classical scholar Reuchlin devoted himself with great ardor to the investigation of the cabala, embodying the result in his works *De Verbo Mirifico* and *De Arte Cabalistica*. Buxtorf, Schickard, Hottinger, Athanasius Kircher, and Knorr von Rosenroth followed in his footsteps; the *Cabbala Denudata* of the last is of especial merit. The works of Trithemius, Cornelius Agrippa, Paracelsus, and Van Helmont developed the subject, and the writings of Jacob Böhme, St. Martin, and Henry More are important with reference to it. Cardan was believed to be one of the most learned and successful practitioners, though according to some accounts he committed suicide in order not to give the lie to his horoscope, which he had prepared with great care. Though the legitimacy of magic was disputed, its reality as an art and a science was scarcely doubted from the 15th to the 18th century. It has still in Europe a few learned and respectable professors and adepts, while throughout the Mohammedan and pagan world its reality is almost universally admitted, and its professors are still numerous.—For the discipline and ceremonies of the art, as now maintained, see Eliphas Levi, *Dogme et rituel de la haute magie* (2 vols., Paris, 1856). To attain the science, according to this work, not only a severe intellectual and moral training, but also a theosophical genius and a wide erudition, are essential. For various information on the subject, see Horst, *Von der alten und neuen Magie Ursprung, Idee, Umfang und Geschichte* (Mentz, 1820); Grasse, *Bibliotheca Magica et Pneumatica* (Leipsic, 1843); and Ennemoser, *Geschichte der Magie* (2d ed., Leipsic, 1844;

translated into English by William Howitt, 2 vols., London, 1854).

MAGIO LANTERN, an optical instrument intended for exhibiting, by means of lenses, magnified images of pictures painted in variously colored transparent gums, on glass slides. It is constructed upon the simple dioptrical principle of conjugate foci (see *OPTICS*), in accordance with which, when any object, as a picture, is brought upon one side of a convex lens, and at a distance slightly greater than its focal length, such object or picture will be reproduced upon a white screen placed at a certain distance on the opposite side of the lens (the axis of the lens, picture, and light illuminating it being supposed to be in the same straight line), and the distance at which a distinct image will be formed on the screen increasing as the picture itself is brought nearer to the focus. In the common form, used for schools or scientific purposes, the instrument consists of a large dark lantern, having at top a bent chimney for the escape of smoke or heated air, and an opening on one side on a level with the flame of a strong lamp within; the side of the lantern opposite the opening being faced with white pasteboard, or furnished with a parabolic metallic reflector, for the purpose of collecting the light and throwing it upon a convex lens in the orifice already referred to. Just outside this lens, within a horizontal tube, the picture or slide is introduced, being of course changeable at pleasure; and beyond this is a second convex lens, a little further than its focal length from the picture, and the distance of which from the latter is regulated by an arrangement for sliding it within the tube. By the action of the reflector and the first lens, a strong light is condensed upon the picture; and its pencils, being converged and made to cross by the second lens, form at their several foci the image, which, being received at that place by the screen, is rendered visible. The inversion of the image is corrected by placing the slides inverted. By undue enlargement the image is rendered indistinct, in consequence not only of diffusion of the light over a larger surface, but also of increasing spherical and chromatic aberration. So far, therefore, as the power of the light admits, it is better to gain increased size in the representation by enlarging the picture used. The image may be shown either by reflection from an opaque screen, as one of strong white paper on canvas; or by transmitted light, in which case the screen may be of fine white muslin moistened with water or oil. The linear magnifying power is equal to the distance of the image from the outer lens divided by the distance of the latter from the picture. For exhibitions before large audiences, the lime light, obtained by keeping a cone of lime ignited in the flame of the oxy-hydrogen blowpipe, and revolving at the same time, has been much used; but the apparatus now prepared by M. Duboscq and others, enables the experimenter to employ the most intense artificial light known,

that of the galvanic current passing between charcoal points; and some of its forms have two reflectors so placed as to throw the images of two pictures at the same time on the same part of the screen, as is required for the effects known as "dissolving views." These effects consist in gradually covering one slide, while the other is uncovered, thus causing one scene to fade or melt into another, as a day into a moonlight scene, and so on. Another curious effect secured by the lantern is that termed the "phantasmagoria;" in which, by bringing the instrument close to the screen, the image is very small, and in a darkened room seems proportionally distant; then, removing the instrument backward, and keeping the lens properly focused, by slightly shifting its place, the enlarging figure seems to be rapidly approaching the spectators, thus forming a complete illusion.

MAGINDANAO. See **MINDANAO**.

MAGINN, WILLIAM, LL.D., a British author, born in Cork, Nov. 11, 1794, died in Walton-on-Thames, near London, Aug. 21, 1842. His father was a classical teacher, under whose care he evinced remarkable aptitude for learning, and in his 10th year was admitted to Trinity college, Dublin. Though one of the youngest of the competitors on entering, he was one of the most advanced, and he maintained his distinction for scholarship throughout his university career. Returning to Cork, he became assistant in his father's school, after whose death in 1818 he successfully conducted it himself for 10 years. His wit and culture made him at the same time the delight and ornament of society. At 28 years of age he received the degree of LL.D. from his *alma mater*, being the first who had ever obtained it so young. Having already contributed in prose and verse to various periodicals, in 1819 he translated the old ballad of "Chevy Chase" into Latin verse for "Blackwood's Magazine," nearly every number of which from that time for many years contained one or more articles by him, usually displaying at once his wit, scholarship, and Toryism. He soon assumed the sobriquet of Morgan O'Doherty, under which he figures in the "Noctes Ambrosianæ." On a visit to Edinburgh in 1820 he for the first time became known personally or by his own name to the publisher and leading writers of the magazine. In 1823 he married, and determined to make literature his profession. In London he wrote for several journals and for the "Quarterly Review;" and so high were his abilities rated that he was at one time selected in preference to Moore to receive the papers and write the biography of Lord Byron. When in 1824 John Murray started his daily journal, the "Representative," Maginn was sent to Paris as foreign correspondent. The "Noctes Ambrosianæ," in "Blackwood," were due to his suggestion; he wrote the whole of the 4th number of them, and furnished various brilliant poems for them throughout the series. In 1828 he became junior editor of the "Standard," a London evening and ultra Tory journal. During

the same year he wrote several stories for annuals, and the political novel "Whitehall, or the Days of George IV." He was one of the projectors of "Fraser's Magazine" in 1829, for which he wrote largely. The brief, lively, and sarcastic descriptions which accompanied the series of portraits of the principal contemporary British authors were, with one or two exceptions, written by him. In 1836 a severely personal critique in "Fraser" on a novel by the Hon. Grantley Berkeley led to a duel between the author and critic, in which the parties fired 3 shots each, and left the field without exchanging a word. In 1837 he began his "Shakespeare Papers," and the first of his 16 Homeric ballads appeared in 1838. The remainder of his life was made unhappy by habits of intemperance, to which his social and jovial qualities specially exposed him. His irregularities caused his connection with the "Standard" to be broken off, and to a great extent excluded his contributions from "Fraser." In 1839 he became editor of the "Lancashire Herald," a weekly journal in Liverpool; but his articles were rarely good, and the proprietor failed. He returned to London in 1839 with a few chapters of a romance, entitled "John Manesty, the Liverpool Merchant," which was completed after his death by Charles Ollier, and published for the benefit of his family. In 1840 he began a weekly issue of "Magazine Miscellanies, by Doctor Maginn," which were badly conducted and extended only to 10 numbers. He was beset by creditors, and in 1843, being cast into Fleet prison for debt, he obtained his liberty by passing through the insolvency court. With broken health, and with distinction as an able and consistent champion of toryism for a quarter of a century, he was disappointed in not obtaining an appointment when his party came into power. He was however personally remembered by Sir Robert Peel, who delicately sent him £100. Beside his papers in "Blackwood," "Fraser," and the "Quarterly," he wrote many others, equally marked by wit and scholarship, for "Bentley's Miscellany" and the first two volumes of "Punch." His "Fraserian Papers," "Odoherly Papers," "Homeric Ballads," and "Shakespeare Papers" have been collected and edited by R. S. Mackenzie (5 vols., New York, 1855-7).

MAGLIABECCHI, ANTONIO, an Italian scholar, born in Florence in 1638, died there, July 4, 1714. After receiving a very imperfect education, he was apprenticed to a goldsmith in his native city, but ultimately abandoned his trade, and devoted himself to literature. He attracted the notice of Michele Ermini, librarian to Cardinal de' Medici, under whose instruction he acquired a thorough knowledge of Latin, Greek, and Hebrew. Cosmo III. appointed him his librarian, in which congenial situation he grew so absorbed in his books as to disregard the ordinary comforts and pleasures of life. He usually passed the whole night in study, and when exhausted nature demanded rest, a wretched straw chair served him for a couch, and an

old threadbare cloak for a coverlet. His memory was prodigious. Though his library was large, and always in such disorder that it was often necessary to remove 100 books to get at one, yet if any person came to consult him about a passage, he could both tell the very page of the work where it was to be found, and point out the very place in the pile where the volume lay buried. By the time of his death he had accumulated a library of 80,000 volumes, which, with funds for its preservation and enlargement, he bequeathed to the city of Florence. It is known by the name of Magliabecchiana, and is open to the public. We owe to Magliabecchi the preservation of many works that had long lain in manuscript in the Laurentian library of the Medici. He produced no literary work of his own.

MAGNA CHARTA, the GREAT CHARTER, or the "Charter of Liberties," as it is commonly called by English writers. Our word charter shows that the Latin *charta*, which meant simply paper, was at length used in the sense of a legal instrument, much as the word paper is sometimes used now. The word charter was however most commonly used to signify the written evidence of grants of land or of privileges from a feudal lord to an abbey or other religious house. From this it was extended to mean the records of all grants from feudal superiors to their subordinates, whether civil or ecclesiastical, and all agreements between them. The Great Charter is of this description, but is from the sovereign to the people. It begins: "John, by the grace of God, king," &c., to various dignitaries and officers, describing them not by name but by office, and "his other faithful subjects: Know ye, that we, for the health of our soul, &c., and by the advice of (sundry persons enumerated), have granted . . . and confirmed, for us and our heirs for ever." But while, in form, the charter was only a gift of certain rights and liberties by the king, it was a very different thing in fact. The Anglo-Saxon institutions and usages, which were very favorable to liberty, had been almost suppressed by the Norman conquerors. The Norman kings, perhaps from the necessity which belonged to their position in England as sovereigns of an invading and conquering race, who needed to hold full and unchecked powers to enable them to preserve what they had won, had claimed and exercised an almost despotic authority. This began to alarm and perhaps to oppress the nobles; and after some struggles and conflicts the feudal possessors of the land of England succeeded in wresting from the feeble hands of John the important concessions contained in the Great Charter. These were very far, however, from being original concessions. There is scarcely one of them, of any importance, which may not be traced back in its principle, if not in its form, to Anglo-Saxon times. The nobles found that these usages, or principles, were all that they wanted to secure their own rights; and by demanding them only they secured the coöperation of a great part of the

clergy and of all the cities and burgesses, and thus were enabled to gain such a superiority over the forces which John could bring to his aid, as to compel him to a peaceful acquiescence in their demands. The preliminaries were agreed upon; the principal provisions of the charter were determined upon and ratified in a preliminary instrument by the king; and then he met the deputies of his nobles, and some of his clergy, at Runnemede, and there, on June 15, 1215, the charter was executed. It bears the seal of the king, and of a large number of nobles. Many copies were made at once, probably one for each county and diocese, and for some other bodies. Two of these originals, for all may be called so, are still preserved in the Cottonian library in the British museum; and there are copies extant made at later periods. Some doubt still rests upon the text, however, in passages of some importance. That printed at the beginning of the first volume of "Statutes at Large," in folio, is in fact a translation of the great charter of Henry III., which purported to be a confirmation of the charter of John. It was however duly enacted by the three estates of parliament, which the charter of John never was. Sir William Blackstone published an edition of it from the Cottonian original (Oxford, 1759). It was drawn up in the Latin language, and the translations into English vary considerably. Professor Bowen of Cambridge, Mass., published one in 1854, made by himself, with other documents illustrating the constitutions of England and America. His translation has the merit of literal accuracy, but therefore is open to some of the uncertainties which belong to the original. Thus the famous section 45 (so in Bowen's edition, sometimes numbered otherwise), which has been called the essence and glory of Magna Charta, runs thus: "No freeman shall be taken, or imprisoned, or disseized, or outlawed, or banished, or any ways injured, *nor will we pass upon him, nor send upon him*, unless by the legal judgment of his peers or by the law of the land." The phrase which we put in italics is an exact translation of *neo super eum ibimus, nec super mittemus*; but it has been much disputed what this means. Coke's opinion seems on the whole to be the best, and is that adopted by Bowen; it is, that no man shall be condemned in the court of king's bench, where the king is supposed to be present, nor before any commissioner or judge whom the king may depute or delegate to try him. The meaning of some other passages is equally obscure; but it is made so only by the lapse of time, and the disuse of phraseology once well understood. For the searching and thorough protection of right and suppression of all wrong afforded by the provisions of this remarkable instrument, and the singular force and precision of much of the language used, prove that those mailed barons had men among them, or at their call, who could employ in their service all the resources of the best cultivated intellects. It was regarded at the time as of so

great importance, that the barons compelled the king to put into their possession the city and tower of London, to be held by them for a certain time as a pledge for the due observance of the charter. They also required him to consent that 25 of their number should be chosen as "guardians of the liberties of the realm," with power to make war upon the king if he should violate the charter. In the subsequent reigns it was repeatedly confirmed, the sovereigns of England finding that when they were in peril and their subjects disposed to resist them, they could do nothing so popular as make a solemn confirmation of the "Charter of Liberties." This circumstance, and the traditional reverence for Magna Charta, together with its actual value, have caused some mistakes concerning it. The nobles who procured it are often called the patriots of their age, and are believed to have contended for the rights of the people. This is not quite true. Every thing in the charter itself, and whatever is related concerning it in contemporaneous history, lead to the conclusion that the purpose of those who formed it was mainly to preserve the rights and privileges of their own order; and the provisions for the security of merchants, and of freemen generally, while dictated probably by some desire to secure their rights, was the readiest way to obtain that coöperation of various interests which was necessary to insure success. In the 13th century the villeins or serfs were probably the majority of the inhabitants of England; but the word villein occurs in Magna Charta but once. In the 24th section it is declared that if a freeman be amerced for crime, it shall be "saving his curtenement," by which word is meant the means of his livelihood, as the tools of a mechanic or the like; and a merchant "saving his merchandise;" and (in the next section) a villein "saving his wainage," and while these (his plough, wagons, and cattle) were certainly the tools of his trade, it is, from the character of the whole instrument, and of the times in which it was made, a not unreasonable inference that this single precaution for the benefit of the villein was at least recommended by the fact, that it preserved to him those implements without which he would be of little use to his lord. In truth, Magna Charta was intended mainly for the nobles and landholders of England; but it embraced in its terms all freemen. It was admirably contrived, and never lost its force; and as, in succeeding ages, villeinage gradually disappeared, and the serfs rose into the condition of freemen, they rose also into the protection and came within the benefit of Magna Charta. Hence there was a constantly increasing class who looked up to it with reverence and with confidence. Its force was never lost by disuse, and its principles were never forgotten. It made the *habens corpus act* and similar securities for personal rights and liberties possible; and in this way it may deserve the epithet which Mr. Hallam uses, when he calls it "the keystone of English liber-

ty."—The general provisions of *Magna Charta* may be stated briefly. It confirmed the liberties of the church, and redressed some grievances incidental to feudal tenures. It prohibited unlawful amercements, distresses, or punishments, and restrained the royal prerogative of purveyance and preemption. It regulated forfeiture of lands, and prevented the grant of exclusive fisheries, or of new bridges injurious to a neighborhood. It established, or at least founded, the right of the owner of personal property to dispose of it by will, and it put the law of dower on the footing on which it has ever since stood. It protected merchants, required uniformity of weights and measures, and forbade alienation of lands in mortmain. It guarded against delays and denials of justice, and brought the trial of issues within reach of all the freemen by means of assizes and circuits; and it asserted and confirmed those liberties of the city of London, and all other cities, boroughs, towns, and parts of the kingdom, from which, as from so many centres, political freedom afterward spread through the land. And in the sections already particularly alluded to, it protected every freeman from loss of life, liberty, or property, except by the judgment of his peers or the law of the land. In one brief section (the 46th), which we should select as that which manifests at once the greatest wisdom and the widest humanity, it declares: "We will sell to no man, we will not deny or delay to any man, right or justice."

MAGNA GRÆCIA, the collective name of the ancient Greek cities and districts in southern Italy (according to Strabo, also of those in Sicily), applied chiefly to the cities on the Tarentine gulf (Tarentum, Sybaris, Ocroton, Metapontum, Locria, Rhegium, &c.), and on the western coast (Cumæ, Neapolis, &c.). Improperly the name is used also of the whole south of Italy, including especially the provinces of Apulia, Calabria, Lucania, and Bruttium, and not alone of the Grecian settlements. The origin of the name is doubtful. The Greek *ἡ μεγάλη Ἑλλάς* seems to be a translation of the Latin name.

MAGNAN, BERNARD PIERRE, a French marshal, born in Paris, Oct. 7, 1791. He studied law, but at the age of 18 enlisted in the 66th regiment of the line, and was engaged in the campaigns of Portugal and of Spain. He became sub-lieutenant in 1811 and captain in 1818, and gained a high reputation for bravery at the sieges of Ciudad Rodrigo and Almeida, as well as in the battles of Busaco, Fuentes d'Onoro, Arapiles, and Vittoria. Being transferred to the imperial guard, he served with it until the capitulation of Paris. In 1815 he was received in the royal guard, and in 1828 fought as lieutenant-colonel in the Spanish campaign. In 1827 he was promoted to a colonelcy, in 1830 distinguished himself in Algeria, and was after his return made commander of the legion of honor. In 1831 an insurrection broke out among the workmen of Lyons, which he was ordered to suppress. Instead of firing on the insurgents,

he opened a parley with them, and was for this suspended. He then entered the Belgian army, and received the rank of general of brigade (1832). In 1839, when there was danger of a war with Holland, he commanded at Beverloo 25,000 men. Peace having been signed between the two countries, he returned to France, where he had held since 1835 the rank of *maréchal de camp*. After being stationed for a short time in the Pyrénées, he obtained command of a division in the department of Nord, which he held for 7 years, during which time he was several times called on to suppress insurrections among the workmen of Lille and of Roubaix. In 1840, having been accused of complicity in Louis Napoleon's attack on Boulogne, and of having honors promised him in case of success, he defended himself against the charge before the chamber of peers. He became lieutenant-general in 1845, and on the revolution of Feb. 1848, he offered his services to Louis Philippe, who declined them. He however remained at the Tuileries with the duke de Nemours, and is said to have been the only general officer in uniform who accompanied the duchess of Orleans and her children to the chamber of deputies. Under the provisional government he was placed in command of the 8d division of the army of the Alps. During the insurrection of June he advanced to the relief of Paris, marching 120 leagues in 7 days. He was soon after ordered by Marshal Bugeaud to suppress a popular movement at Lyons. Permitting the insurrection to organize, he led the troops in person to the attack, and, after a desperate conflict of 6 hours, was triumphant. For this he received the cordon of a grand officer of the legion of honor, and was promoted to command the division of Strasbourg. In July, 1849, he was elected from the department of the Seine to the legislative assembly. He however took but little part in the sittings, being prevented by military duty on the frontiers, and afterward by the command in chief of the army of Paris, to which he was appointed July 15, 1851. He rendered important aid to Louis Napoleon during his rise to power, was one of the few who organized with the prince president the *coup d'état*, and fought under Gen. St. Arnaud on Dec. 2, 3, and 4, 1851. He was retained in the command of the army of Paris, which he still holds, was promoted to the rank of marshal, and in 1852 was made a senator, and in 1854 grand huntsman to Napoleon III.

MAGNE, PIERRE, a French statesman, born in Périgueux in 1806. He studied law in Paris, practised for some time in his native place, and between 1843 and 1848 was a member of the chamber of deputies. During this interval, having attracted the attention of Marshal Bugeaud by some able reports on Algerian affairs, he was appointed secretary of the committee on the budget, and subsequently minister of the department of Algeria established by Guizot. In 1849 he was appointed under secretary of finance, in 1851 minister of public works, in

which capacity he showed great industry and ability, and in 1854 minister of finances, a position which he still occupies.

MAGNENTIUS, **FLAVIUS POPILIUS**, Roman emperor of the West, of German birth, died in Aug. 353. He rose under Constantine from the rank of a private soldier to that of count. Having been intrusted by Constans with the command of the Jovian and Herculean battalions, which had been substituted for the ancient prætorian guards at the remodelling of the empire by Diocletian, he availed himself of his office to plot the emperor's overthrow. On Jan. 18, 350, presenting himself in imperial robes at a great banquet given by one of the conspirators at Autun, he was immediately saluted with the title of Augustus; and assassins sent for the purpose having despatched Constans, Magnentius was acknowledged as emperor by all the western provinces except Illyria. Constantius, on hearing of his brother's murder, hastened from the confines of Persia and defeated Magnentius at Mursa on the Drave in 351, and in the passes of the Cottian Alps in 353. These disasters led to the defection of all the countries that had recognized the usurper, who thereupon committed suicide.

MAGNESIA, the oxide of the metal magnesium, one of the alkaline earths, the compound character of which was discovered by Davy. It consists of one equivalent of magnesium (Mg)=12, and one of oxygen (O)=8, or 60 per cent. of magnesium and 40 of oxygen. Like lime, it is found in nature combined with carbonic acid, which may be expelled by calcination at a red heat. Thus obtained, it is a fine, light, white powder, having neither taste nor smell, almost insoluble in boiling, but less so in cold water, of specific gravity 2.3, and known as calcined magnesia. It was regarded as infusible until melted by Dr. Hare with his compound blowpipe. Its properties are alkaline, and it neutralizes all acids. In pharmacy it is prepared from the carbonate to be administered as an antacid and laxative. It is useful in dyspepsia and sick headache caused by acidity of stomach and constipation; it is sometimes preferred to the carbonate on account of the smaller dose required, as well as the absence of carbonic acid gas in its composition. In calculous complaints it is beneficial by diminishing the product of uric acid. As a laxative its mild action as well as its other properties renders it a favorite medicine for children and infants. The freshly precipitated hydrate is recommended as an antidote to arsenic.—The carbonate of magnesia is also largely employed in medicine. It exists in the magnesian limestones (see **DOLOMITE**), and forms the mineral species magnesite. From these it may be obtained, but the sources that chiefly furnish it are the sulphate of magnesia (see **EPSOM SALT**) of mineral springs, or this salt mixed with chloride of magnesium supplied by the bittern of salt works. It is thus manufactured in New England. In Baltimore and Philadelphia the sulphate is obtained from

a silicious hydrate of magnesia found in the serpentine rocks of that region. Most of the carbonate used in this country is imported from Scotland, and is of the kind called light magnesia. It is prepared by mixing together dilute solutions of sulphate of magnesia and carbonate of soda, with or without heating. An interchange of acids and bases takes place, and an insoluble carbonate of magnesia is precipitated, which may be washed with hot water, collected, and dried. For heavy magnesia a cold saturated solution of carbonate of soda is added to an equal volume of boiling saturated solution of sulphate of magnesia, and 8 volumes of water. The mixture is boiled till effervescence has ceased, and then more boiling water is added, the whole being continually stirred. This variety is granular, while the light is more or less intermixed with prismatic crystals. The light cubes of magnesia are prepared by removing the precipitate after it has drained for one or two days in linen strainers to cubical moulds open at the bottom, and standing in a warm room upon a table of plaster or porous stone, which absorbs the water. After a time the moulds are turned over, so as to present another side to the absorbent surface. Carbonate of magnesia resembles the calcined in its appearance and qualities; it is somewhat more soluble in cold and in hot water, but still requires to dissolve it 9,000 parts of the latter and 2,493 of the former. It contains some water in its composition, but the proportions of its ingredients vary with the methods of its preparation. Phillips found that 4 equivalents of the carbonate were combined with one of the bihydrate and 4 of water. In medicine it is used very much for the same objects as the calcined magnesia. When decomposed by the acids in the stomach, the new compounds of magnesia found are usually cathartic. Such are produced by following it with draughts of lemonade. Various other compounds of magnesia, as the citrate, tartrate, and sulphate, are used in medicine; the first, which is prepared by treating the carbonate with citric acid, adding an excess of acid, impregnating with carbonic acid, and sweetening with sirup, has within the last 10 years come into extensive use as a cathartic, mild and cooling in its properties. Magnesia combined with sulphurous acid forms the sulphate recently found to be a very important disinfecting agent. (See **DIAPHORANTS**.) Magnesia in combination with silica enters largely into the composition of many rocks and minerals, such as serpentine, steatite or soapstone, asbestos, &c.

MAGNESIA. I. The most easterly division of ancient Thessaly, Greece, a narrow and mountainous strip of land, containing among others Mts. Ossa and Pelion, and bounded N. by the lower course of the Peneus, on the confines of the Macedonian district of Pieria, E. and S. E. by the Ægean, S. W. by the Pagasan gulf, and W. by the great Thessalian plain. II. The name of two cities of Lydia, Asia Minor. One was situated on the S. bank of the Hermus, and

celebrated by the great victory of the Romans over Antiochus the Great of Syria (190 B. C.), which made the conquerors masters of a part of Asia Minor. The other was situated on the river Lethæus in the valley of the Mæander, and had a celebrated temple of Diana, the ruins of which are still visible. It was one of the towns given by the king of Persia, Artaxerxes, to his guest the exiled Themistocles.

MAGNESIUM, the metallic base of magnesia; symbol, Mg.; chemical equivalent, 12; specific gravity various, given from 1.7 to 2.24; hardness that of calcareous spar. Davy proved its existence; but Bussey in 1830 first obtained it in sufficient quantity to test its properties. He decomposed the chloride of magnesium by transmitting through it when heated the vapors of potassium. The metal resembles silver in appearance; it is malleable, ductile, and fuses at a dull red heat. It does not change under water or in dry air, but in damp air it soon oxidizes. It consumes with a brilliant white flame when heated to redness, or when thrown into hydrochloric acid. It burns brilliantly in chlorine or in the vapors of bromine, iodine, sulphur, &c. It has recently been proposed by M. Bunsen of Paris to employ this metal in the form of fine wire for illuminating purposes. He finds that it may be lighted by the flame of an alcohol lamp, and in burning gives a perfectly steady and very intense light. A wire $\frac{1}{16}$ of an inch in diameter burns at the rate of about 3 feet in a minute, and gives a light equal to that of 74 stearine candles of 5 to the pound. The weight of such a wire 3 feet long is about 2 grains. M. Bunsen proposes to have the wire wound upon bobbins and furnish it at a regular rate to the lamp. Should the metal be procurable at a considerably reduced cost, as may very likely follow an increased demand for it, it may then prove an excellent method of furnishing light for domestic purposes, and more particularly for lighthouses and uses requiring a great intensity of light. Even at its present cost it may be advantageously used for photographing in places inaccessible to the light of day. For this application it is especially adapted by reason of the extraordinary power of the photochemical property of its light.

MAGNETISM. If a bar of slightly tempered steel be held vertically and struck several blows with a wooden mallet, it will acquire the property of attracting iron filings at its two extremities. This property was first observed in specimens of an oxide of iron found near Magnesia, a city of Lydia in Asia Minor, and hence the name magnetism has been applied to the phenomena to which it pertains. The same property may be communicated from one bar of steel to any number of similar bars, by rubbing one half of the length of each of the latter with the end of the former which was toward the earth in the experiment above mentioned, and the remaining half with the other end of the same bar. In this process a remarkable fact becomes evident, namely, that the bar which is employed

to impart the magnetic property loses none of its own power; on the contrary, if the process is properly performed, it will become stronger; and hence we deduce the conclusion, that in magnetization there is no transfer of any substance from one body to another, but the development of a latent principle. If a magnetized bar be suspended by a fibre of untwisted silk, in such a manner as to have perfect freedom of motion, it will assume a N. and S. direction; that is, it will exhibit the phenomena called polarity. If to either end of a magnetized bar thus suspended a piece of soft iron be approached, attraction will be exhibited between them; when a similar bar is rolled in iron filings, the latter will be found to adhere in thick clusters at the two ends or poles, while none will attach themselves to the middle of the bar. If, instead of presenting to the suspended magnet pieces of soft iron, we bring near to its two ends in succession the two poles of another magnetized bar, repulsion as well as attraction will be exhibited; and by an attentive study of the phenomena we shall find that similarly magnetized ends repel, and dissimilarly magnetized ends attract each other. These forces act at great distances, through all interposed bodies, and like gravitation diminish in intensity with the square of the distance from each pole. If a number of bars of soft iron be placed near each other in the same straight line, and the N. end, for example, of a strongly magnetized steel bar be brought near one end of the series, each piece of iron will become magnetic and exhibit polarity. The near end of the first magnet will be a S. pole, the far end a N. pole, and so on throughout the series, as follows:

S. N. S. N. S. N. S. N. S. N. S. N.

When the magnet is removed, the polarity of the iron bars ceases; and when the pole of the developing magnet is reversed, the polarity of the whole series is also reversed. The development of magnetism in this way is called induction, and by it we are enabled to explain many facts which would be otherwise perplexing. In accordance with this principle, we can assert that a magnet does not attract soft iron in its natural state, but that it first renders the metal magnetic, and then the attraction takes place between the dissimilar poles of two magnets. Again, when we sprinkle iron filings on a paper placed over a magnetic bar, they arrange themselves in beautiful curves radiating from each pole and joining near the equator of the bar. These lines are sometimes called (we think improperly) lines of magnetic force; they merely result from the fact that each particle of iron becomes by induction a separate magnet, and attracts the adjacent filings, their arrangement in this case being the same as that of a series of small needles when under the influence of the two poles of a magnetic bar. The induction takes place readily in soft iron, but disappears as soon as the inducing magnet is removed, but not so with hardened steel; though the effect

is less powerful in this, the polarity is permanent. The method of making steel magnets of great power, which we have found from long experience the simplest and most efficient, is as follows: Procure say 10 flat bars of good steel bent into the usual form of a horse shoe; let these be well hardened and fitted with their flat sides together so as to form a compound magnet. Each of the members of this bundle may be magnetized separately to a small degree by supporting one of the legs on the lower end of a long rod of iron held nearly perpendicular in this latitude, and the other leg on the upper end of the same rod; or by rubbing one leg with the N. pole of a magnetized bar and the other with the S. pole. The several shoes, or bars, being in this way feebly magnetized, 8 of them are joined together with their similar poles in contact, forming a compound magnet with which the remaining 2 bars are to be magnetized to a higher degree. For this purpose the latter are placed on a table on their flat sides, the N. pole of the one in contact with the S. pole of the other, so as to form a closed circuit; on any part of this circuit the compound horse shoe is placed perpendicular to the plane of the table, with its N. pole in the direction of the S. pole of the bar or shoe on which it rests, and then caused to slide in either direction entirely around the circuit, care being taken to retain its perpendicularity. After having gone over the surface of the 2 shoes in this way several times, they are turned over without separating their ends, and the process repeated on the side which was previously under. By this method the 2 bars will receive a magnetic power nearly equal to the sum of the powers of the 8 magnets in the bundle. Next these 2 bars are placed in the bundle, and 2 others are taken out and subjected to the same process. These in turn are put into the bundle, and 2 others are taken out and rubbed in the same way, until each pair of bars has been gone over 2 or 3 times in succession. By this method, with the most feeble beginning, the magnetism of the several shoes may be developed to their full capacity, and a magnetic battery produced of great power. A compound horse shoe of this kind is the most convenient instrument for magnetizing straight bars of hardened steel for practical uses. Suppose, for example, we wish to magnetize 4 bars, each 16 inches long, an inch wide, and $\frac{1}{4}$ of an inch thick; these are placed on their flat sides in the form of a rectangular parallelogram with their ends in contact; the compound horse shoe is then placed perpendicularly on the middle of one of the bars, and slid entirely around the parallelogram several times in succession; each bar is then turned over in its place so as to bring its lower side upward, and the process repeated, care being taken to keep the horse shoe perpendicular to the plane of the parallelogram and in the same relative positions of its poles to those of the bars. By this method, if the compound horse shoe is suffi-

ciently powerful, the 4 bars can be magnetized to saturation in the course of a few minutes. If there are but 2 bars to be magnetized, the parallelogram is completed by joining the ends of these with 2 similar bars of soft iron, and the same process of rubbing performed as before. We have seen, in the article *ELECTRO-MAGNETISM*, that the most powerful magnetic induction is produced in soft iron by transmitting around a bar of this metal a current of galvanism, and that temporary magnets of great power can be produced in this way. The same method affords the readiest means of strongly magnetizing steel bars. Whatever may be the nature of the change which takes place in iron at the moment of magnetization, we are certain that it pertains to the atoms or molecules of the body, and not to the assemblage of these as a whole. To be convinced of this, it is only necessary to magnetize a steel rod, for example a thick knitting needle, the polarity of which will be exhibited near its two ends, while no attraction will be manifested near the middle. If however we break this into two pieces, we shall find each half is a perfect magnet; the separated ends which were previously joined together in the middle of the whole length will now exhibit polarity. If each of these pieces be again broken in two, we shall have four perfect magnets; and however frequent the division or small the parts into which the needle is divided, each part will still exhibit a N. and S. pole. We may continue, at least in thought, this division, and we have no reason to doubt that however far it might be carried, the same result would be produced. We infer from this experiment that the reason why the middle of a bar exhibits no magnetism is not that none really exists there, but that it is neutralized by opposite polarities. We are also certain that magnetization is attended with at least a momentary motion of the atoms of the iron. This is proved by the fact that during the sudden magnetization of a bar of iron, by means of a current of electricity transmitted through a spiral conductor enclosing the bar, a sound is emitted; and if the bar be rapidly magnetized and demagnetized by an interruption of the current, a musical sound will be produced. This fact was first noted by Dr. Page of the United States, and subsequently experimented upon by De la Rive, Becquerel, and others in Europe. The fact that a change takes place in the molecules is also rendered evident by an experiment of Mr. Jule of Manchester, England, in which he found that, although the whole capacity of the iron bar did not change on being magnetized, yet its dimensions varied, its length being increased and its width correspondingly diminished. Again, in the magnetization of iron, it is found that time is required to produce a full effect, as if it were necessary that inertia should be overcome; and Mr. Grove has shown that, in rapidly changing the polarity of a bar by means of an alternating current of electricity, the iron increases in temperature. Dr. Maggic

of Verona asserts that a circular plate of homogeneous iron, when magnetized, conducts heat better in a direction perpendicular to the line joining the poles than in the direction of this line itself. It is also stated that iron strongly magnetized resists the action of the file in a greater degree than in its ordinary state.—It was formerly supposed that magnetism could be developed only in iron, nickel, and cobalt; but we now know from the researches of Faraday, that all bodies exhibit signs of an inductive influence, provided the magnetic power applied be sufficiently great. From the results of his experiments, Faraday was led to divide all bodies into two great classes; those like iron, nickel, and cobalt, which, on being suspended between the poles of an electro-magnet, assume an axial direction, were denominated magnetic bodies, or paramagnetic; while those which arrange themselves at right angles to the magnetic meridian were denominated diamagnetic. (See DIAMAGNETISM.) The following series exhibits some of the last results obtained by Faraday on the magnetic and diamagnetic powers of bodies, in which the angle of torsion necessary to balance the force of a magnet expresses the power of the various substances, volume for volume, + representing the paramagnetic bodies, and — the diamagnetic: proto-ammoniate of copper, +184.28°; oxygen, +17.5°; air, +3.4°; nitrogen, +0.8°; carbonic acid gas, 0.0°; hydrogen, —0.1°; glass, —18.2°; pure zinc, —74.6°; alcohol, —78.7°; wax, —96.73°; nitric acid, —87.96°; water, —96.6°; sulphuric acid, —104.47°; sulphur, —118.°; bismuth, —1967.6°. Faraday discovered another remarkable evidence of the action of magnetism on liquids and solids, as manifest in the effect produced on a polarized beam of light. Let a piece of gas pipe 18 inches long be closed at each end with a plate of tourmaline and filled with water. Let the axes of the tourmalines be placed transversely so that the polarized beam of light which passes through the first may not be transmitted through the second. If while the apparatus is in this condition the iron be magnetized by a current of electricity passing through a long wire helix surrounding the tube, the beam of light will be partially transmitted by the second tourmaline. It is evident from this result that the magnetization of the iron has produced an effect on the particles of the liquid, which has enabled them to react on the polarized beam of light and to produce as it were a twist in its plane of polarization. A similar result will be produced if the liquid be contained in a tube of glass or any other substance, and placed between the poles of a powerful magnet. To observe the effect however in this case, the poles of the magnet should be perforated for the transmission of the light. A similar effect is produced upon solid transparent bodies, and particularly upon heavy glass of the silicio-borate of lead. Faraday also discovered the fact that crystallization exerts a considerable influence upon the direction of

crystallized bodies placed between the poles of a powerful electro-magnet; Plucker found that the axis of crystallization tended to assume the axial or equatorial direction; and Tyndall of London and Knoblauch of Germany established the fact that if the molecules of any body are more condensed in one direction than in any other, the magnetism will act along this direction with greatest intensity. If the substance is paramagnetic, the line of greatest condensation will assume an axial position; if diamagnetic, the same line will come into a state of rest in the equator. This is shown by mixing carbonate of iron with gum into a stiff paste, a disk of which being compressed between the fingers, so as to give a greater density in one direction, and afterward suspended between the poles of a powerful electro-magnet, will settle with its line of greatest condensation in the axial direction. If a similar experiment be made with a compound of powdered bismuth and gum, the line of greatest condensation of this factitious substance will assume an equatorial position.— Various attempts have been made to show a direct magnetizing influence in the solar beam to develop magnetism in soft iron needles, and it has even been asserted that the direct radiation from the moon has a powerful disturbing effect upon the needle of the mariner's compass; but the most delicate experiments made by those best qualified for such investigations have failed to exhibit any result of this kind.

MAGNETISM, TERRESTRIAL. The study of terrestrial magnetism is without doubt one of the most useful and important branches of physical geography; the service which it has rendered to civilization and commerce can scarcely be too highly estimated. Aware of its importance, almost every enlightened government has given attention to the subject, and in some cases large sums have been expended in its prosecution. Gilbert in 1600 was the first to announce the bold hypothesis that the earth is a great magnet, and that the needle assumes a N. and S. direction because it is attracted by the dissimilar and repelled by the similar poles of the terrestrial sphere. He illustrated this hypothesis by magnetizing small globes of steel; but this illustration, though it served in a general way to represent the phenomena, is not strictly correct. In the first place, the magnetism of the earth is not symmetrical like that of a steel magnet, but is to a considerable degree irregular; and secondly, it is not permanent, but subject within certain limits to almost continual changes both in direction and intensity. Indeed, the magnetic needle is scarcely ever absolutely stationary from one moment to another, but is constantly exhibiting minute variations. If the earth is a magnet, the free needle at any place should assume a definite direction; but it does not follow from the hypothesis that this direction must be the true north and south, since the magnetic poles of the earth do not necessarily

coincide with its geographical poles. If the two poles be in the same meridian with a given place, the needle will at that place point to the true north; but if the magnetic pole lie either W. or E. of the meridian of a given place, the N. end of the needle will deviate either E. or W. of the true north, and the phenomenon of the declination or variation of the compass will be exhibited. That the needle does not point to the true north in all portions of the earth was observed by Columbus in his first voyage of discovery, and thousands of observations have since been made to obtain the data for constructing charts to represent for the use of the mariner the declination in various parts of the earth. Again, if we assume that the earth is a great magnet, it will follow that in passing from the magnetic equator, the needle which is accurately balanced, so as to settle horizontally at the former place, will incline or dip as we advance to either pole. That this is really the fact was first discovered by Robert Norman in 1576.

Furthermore, if the earth is a magnet, we should expect that the magnetic intensity or the strength of the action would not be the same at all points of its surface, and this inference has also been found to be true. By counting the vibrations of a delicate dipping needle, we find that the strength of the magnetism of the globe increases as we go from the equator toward the pole. The magnetic intensity, however, exhibited by observations of this kind, does not indicate as rapid an increase of force as we approach the magnetic pole as might be expected from such a distribution of magnetism as would result from a magnetized sphere of iron. In conformity with the three magnetic elements we have mentioned, namely, the variation, the dip, and the intensity, it is customary to represent the magnetic condition of the earth at a given time by three systems of lines supposed to be drawn on the surface of the globe. These are as follows: 1, the line drawn through all places where the needle points to the true north or south, to 5° W., to 5° E., 10° W. and 10° E., and so on, called the isogonic lines, or lines of equal variation or declination; 2, lines nearly at right angles to the former, drawn through all places exhibiting the same angle of dip of the needle, called isoclinical lines; and 3, a system of E. and W. lines joining all places having the same magnetic intensity, and consequently known by the name of isodynamic lines. It is a problem of much practical importance in regard to the art of navigation, as well as to the study of the phenomena of terrestrial magnetism, that these three systems of lines should be accurately determined; and accordingly expeditions have been fitted out by different nations almost expressly for this purpose. All the observations, however, which have been made in regard to them, indicate the fact that they are not permanent, but are constantly undergoing a change, of which the law is exceedingly complex. Halley's chart of declination for 1800 is very different from that of Barlow for 1833; and Hansteen's dip chart for

1780 does not represent the isoclinical lines of the present day. The great practical object then of investigation in this branch of science, is to discover the law of these changes, in order that, the position and form of these lines being determined for a given epoch, they may be calculated for any future time. Our limits will not permit us to give a full history of all the attempts which have been made to solve the problem of terrestrial magnetism, or of the various hypotheses which have been invented to represent approximately the distribution and changes of the magnetic force of the earth; we must therefore confine ourselves to the more prominent. The phenomena were first referred to a very small magnet at the centre of the earth, the direction of which is subject to irregular changes. Tobias Mayer, instead of supposing a magnet to be placed at the centre of the earth, conceived one to be situated at about the 7th part of the earth's radius from the centre, and from this hypothesis he was enabled to calculate the variation and dip in places not far distant from those in which these quantities had been determined by actual observation. Hansteen of Norway, to whom the world is indebted for collecting an immense number of observations, endeavored to represent the phenomena by the hypothesis of two small eccentric magnets of unequal strength placed at the centre of the earth, giving rise to 4 magnetic poles, 2 in each hemisphere. In order to represent the variations of the needle, the poles of each of these two magnets were supposed to perform a revolution around an intermediate line, with different velocities. We owe to the celebrated Gauss of Göttingen, however, the first rigid investigation of the problem in accordance with a definite plan. He founded his research on the assumption that the terrestrial magnetic force, or that which is exerted on a needle freely suspended by its centre of gravity, is the resultant action of all the magnetized particles of the earth's mass. According to this assumption, the governing power which affects the needle is due to the magnetism of the earth itself, while the different perturbations to which the needle is subjected are the results of extraneous forces. To give clearness of perception, he represents magnetization as consisting in the separation of two magnetic fluids, giving magnetic polarity to each particle, or in other words to a repulsive and attractive force acting inversely as the square of the distance. No change would be produced in the result by adopting the hypothesis of Ampère, in which magnetism is held to consist of constant magnetic currents; nor would there be any difference if terrestrial magnetism were ascribed to a mixed origin, as consisting partly of actual electrical currents and partly of permanently magnetized masses. Starting from these assumptions, Gauss obtained a general mathematical expression for the action of the whole globe on a magnetic needle, however irregular might be the distribution of the magnetism of the former. In other words, he obtained an ex-

pression by which, if the distribution of the magnetism of the earth were known, and the intensity of its action ascertained with reference to a unit of distance and intensity, the position of the needle and the magnetic force by which it was acted upon at any point could be determined; and conversely, if the action of the earth on the needle were known for a large number of places on the surface of the earth, the distribution of the magnetism might be considered the unknown quantity, and might be approximately found from the data thus afforded by observation. In this way Gauss has been enabled to give a method of constructing general charts to represent in every part of the earth the magnetic declination, inclination, and isodynamic lines, the intensity and direction of the magnetic force being known at a given number of places. The data necessary for improved charts of this kind have been furnished by the magnetic surveys made in various parts of the world, within the last quarter of a century, at the suggestion and principally under the direction of the British association. By repeating the construction of such charts for different epochs, the secular changes in different parts of the earth will become known; and it is hoped that, in due time, if the system of magnetic observations which has been established should be continued, the law of the changes will ultimately be fully ascertained. The investigations of Gauss have shown that the hypothesis of two movable magnets at the centre of the earth does not explain the phenomena of terrestrial magnetism. He defines a magnetic pole to be the place at which the needle points directly downward, or at which the dip is 90° . Indeed, he has pointed out the very obvious fact, that if there be two such points in the northern hemisphere, then there must be somewhere between the two a third point at which the needle would also assume the vertical position. Gauss, however, arrives at the remarkable conclusion that the place of greatest magnetic intensity does not coincide with that which is usually denominated the pole; and it would appear that there may be a diffused space in the northern hemisphere around which the isodynamic lines may be drawn, representing apparently at least two centres of greater magnetic attraction. These phenomena are best represented by the hypothesis of magnetism due to currents of electricity in the earth, but as yet no definite hypothesis has been advanced as to the nature of such currents. It is true, they have been referred to thermoelectricity; but how the varying heat of the sun or the high temperature of the interior can give rise to currents constantly circulating round the earth, of such intensity and such flexures as would account for the observed direction and intensity of terrestrial magnetism, has not yet even approximately been made out. The latest general charts which have been constructed from a combination of actual observation and theoretical deduction are by Gen. Sabine and Mr. Evans of England, and Dr. Gold-

schmidt of Germany. According to these there are but two magnetic poles, one in each hemisphere. Dr. Goldschmidt places the northern pole in lat. $73^\circ 35'$ N. and long. $95^\circ 39'$ W.; the southern in lat. $72^\circ 35'$ S. and long. $152^\circ 30'$ E. The position assigned by Evans for the northern pole is slightly different; he places it for the year 1858 in lat. 70° N. and long. 96° W. of Greenwich. The positions of the southern poles have not been determined with certainty. From the same authority there are four places of greater magnetic intensity—one in North America in lat. $52^\circ 19'$ N. and long. 92° W.; another in Siberia in lat. 70° N. and long. 120° E. The position of the southern places of greater magnetic power have not been definitely ascertained. Some facts relative to the lines of variation on the North American continent are given in the article COMPASS; and a more definite and scientific account of the very important contributions of the U. S. coast survey is contained in the article under that title, which under its able superintendent, collateral to its great object, is constantly furnishing important additions to our knowledge of the physics of the globe. Prof. Bache, director of the coast survey, has given particular attention to the subject of the distribution of magnetism within the territory of the United States. With the assistance of Mr. Hilgard and Mr. Schott he has collected and discussed the observations of Col. Lefroy in Canada, of the late Professors Keeley and Locke, of Professors Loomis and Bond, Major Emory, Capt. Whipple, Lieut. Ives, Dr. Kane, and those of the coast survey itself, which up to the present time have been made at upward of 300 separate stations. Under the direction of Professor Bache, Mr. Schott has also prepared a set of tables for practical use, giving the secular changes of the magnetic declination for the principal cities in the eastern part of the United States. (See the "American Journal of Science," vol. xxiv., and also vol. xxix., second series.)—What we have said in regard to the magnetism of the earth principally relates to its state at a particular time. We shall now briefly give an account of the discoveries which have been made in regard to the changes to which terrestrial magnetism is subjected; and for the data from which these have been deduced science is indebted to the several magnetic observatories established in different parts of the earth. These are furnished with improved instruments, which in their present perfect state constantly record, by means of photography, the minutest changes in intensity and direction of the magnetic force. The magnetic perturbations were at first supposed to consist of two classes, namely, periodical and fitful; the latter, however, are now known to recur at regular periods, and are therefore not properly designated by this term. The changes of terrestrial magnetism are of three classes. The first consists in a movement of the centres of the magnetic force in geographical space, from W. to E. in

the northern hemisphere, and from E. to W. in the southern. It is to this motion that the change denominated secular is ascribed, and to which is referred the variations from year to year in the positions of the magnetic lines. Although the variations of the needle at a given place may appear to be very irregular, yet from a comparison of those in all parts of the earth it is found that the motion of the system of forces which produces these changes has been uniform, or nearly so, during the last 2 or 3 centuries. The cause of this change is at present entirely unknown; it has no analogy with any other class of physical phenomena with which we are acquainted. By a rough comparison of the isothermal lines and the lines of equal magnetic intensity, a general similarity has been observed, and hence the two have been considered as referable to the same cause; but it will be perceived that this analogy does not hold, since the magnetic lines are in constant motion, while the isothermal lines retain very nearly a fixed position, or at least change in comparison with the other lines with extreme slowness. The second system of changes has evident relation to the annual position of the earth in its orbit round the sun, and its revolution on its axis. These were at first ascribed to the influence of the heat of the sun on different parts of the earth; but they have the remarkable characteristic of exhibiting notably the same amount in the southern hemisphere as in the northern, and in the tropical as in the temperate zones. The magnetic force is found to be greater in the months of December, January, and February, when the sun is nearest to the earth, than in those of May, June, and July, when it is most distant from it; whereas, were the effect due to temperature, the two hemispheres would be oppositely instead of similarly affected in each of these two periods. We must therefore ascribe the effect to the direct magnetism of the sun itself, and consider it established that this luminary like the earth possesses attracting and repelling poles, and that the effects on the needle result from the different positions of the earth in regard to these centres of action. The pole of the needle which is least distant from the sun makes a double diurnal movement in the following manner. It arrives at its greatest western excursion 4 or 5 hours before the sun passes the meridian of the place, as if it were repelled; it then turns eastward with increasing celerity, and reaches the limit of its eastern excursion one or two hours after that passage. As the sun passes the inferior meridian, there is repeated in the night the same variation as that which took place in the day. To illustrate the action, let us suppose two globes, a larger and a smaller, placed upon the same plane, with their axes of revolution not precisely parallel to each other, as in the case of the earth and the sun; and let us further suppose that one globe is made to revolve round the other, the axis of the former being constantly parallel to itself. It is evident

that in one half of the orbit of the moving globe the northern poles will be inclined toward each other, while in the other half of the orbit the southern poles will be similarly inclined; and if we further suppose that the magnetic axis of the sun, as in the case of the earth, does not differ very much from the axis of rotation, we shall have an explanation of the effects observed in the records of the diurnal motions of the needle. The N. end of the needle, which is attracted by the N. pole of the earth, will be repelled by the N. pole of the sun, provided it has dissimilar magnetism to that of the earth, and consequently will decline from the sun; and as, on account of the revolution of the earth on its axis, this luminary appears on the E. of every place in the northern hemisphere in the morning and on the W. side in the afternoon, corresponding variations in the needle will be exhibited. In the other half of the year, for a similar reason, the S. end of the needle will be affected in an analogous but opposite manner. The strength of the magnetism of the earth will be increased by the nearer approach of the sun, in the same way that two magnets having their dissimilar poles opposite each other are increased or diminished in magnetic power by a diminution or decrease of distance. We are indebted for the interesting discovery of the polar action of the sun to Gen. Sabine of England, who has had charge of the reduction of all the magnetic observations of the English colonial observatories; and to Dr. Kriegl of Austria for another of the same character, which leads us to extend the principle of magnetism to the moon. It is found that there is a variation of each of the magnetic elements corresponding with the diurnal position of the moon in regard to the earth; but this resembles the tides in exhibiting two maxima and two minima in the course of 24 hours, regularly changing in time with the motion of the moon in her orbit around the earth. These phenomena indicate that the moon is not magnetic *per se*, that is, possessed of permanent magnetism, but its magnetic condition resembles that of soft iron developed by the continued but varying inductive influence on account of change of distance of the earth and the sun. That these changes in the magnetic elements cannot be due to heat in this case, must be evident, since the temperature of the moon is but little greater than that of celestial space. The third class of variations, which was formerly denominated fitful, is now known in a certain sense to be periodical. They were denominated by Humboldt magnetic storms, and were found by Arago to accompany the appearance of the aurora borealis. Although it is impossible to predict from our present knowledge the recurrence of individual cases of these great perturbations in the intensity and direction of the magnetism of the earth, yet they are known to increase in number and magnitude of action, within the period of a little more than 5 years, and gradually to diminish through nearly an equal period, the whole

cycle being completed in a little more than 10 years. The magnetic storms have been observed in the most distant parts of the earth, and no doubt can now exist as to their cosmical character. The lunar influence of which we have just spoken does not appear to participate in or be connected with this decennial inequality. The periodicity of these apparently fitful variations of magnetism was first pointed out by Gen. Sabine, and has since been established by the investigations of Prof. Lloyd of Ireland, Dr Lamont of Germany, and by those of Prof. Bache from the observations made under his direction at Girard college. But the most astonishing result in regard to this class of perturbations is that they coincide with the periodical recurrence of the maxima and minima of the spots on the sun. A German astronomer, M. Schwabe, has established, by nearly 30 years of unremitting daily observation, the periodicity of this phenomenon. He finds that the solar spots increase in magnitude for about $5\frac{1}{2}$ years, and diminish through an equal period, the cycle, as in the case of magnetic storms, being completed in about 11 years. The discovery of a connection of this remarkable kind gives to magnetism a high position in the scale of distinct natural forces, and assigns to it equally with gravitation a truly cosmical character. It is not impossible that the spots on the sun may be connected with the falling into its gaseous envelope of meteorites, and this suggestion is favored by a late observation of Mr. Carrington of England, in which a remarkable appearance was observed on the surface of the sun, analogous to that which would have been produced by an occurrence of the kind we have mentioned. If this suggestion should be found to be correct by future observations, it will afford an explanation of the periodicity of the spots, since we are assured of the fact that the recurrence of shooting stars in great numbers is governed by a cyclical law.—It is not intended by what has been stated to convey the idea that meteorological changes may not affect the position of the needle, and that even the magnetic condition of the atmosphere, according to the hypothesis of Faraday, may not produce appreciable results; but as yet the actions of these appear to neutralize each other, and to leave no definite record of their existence in the course of periods of considerable length. It is probable, however, that with the improved photometrical instruments and a more minute scrutiny of their records, the effects due to these causes will be shown. Since the agitation of the atoms of an iron bar is found to favor the development of magnetism by induction, it is not improbable that the magnetism of the earth may be disturbed during the continuance and shortly after the occurrence of an earthquake.

MAGNETO-ELECTRICITY. We have seen in the article **ELECTRO-MAGNETISM** that great magnetic power is developed by passing a current of galvanism around a bar of soft iron; and since in all cases a mechanical action is accom-

panied by an equal amount of reaction, it is reasonable to suppose that electricity ought to be evolved by magnetism. Various fruitless attempts were however made to obtain this result; the form in which the effect was to appear was unknown, and it was not until 1832 that Faraday succeeded in exhibiting currents of electricity in a wire by means of magnetic reaction. It has also been stated in the same article, that, in accordance with the theory of Ampère, all the mechanical properties of an ordinary magnet may be exhibited by currents of electricity transmitted through spiral conductors; and hence, in order to present the phenomena of this class in the simplest form, we shall begin with stating the fundamental facts of what is called electro-dynamic induction, or electricity induced by a galvanic current. 1. Let a portion of a copper wire be extended in a straight line horizontally, and the two ends at a distance be connected with a galvanometer so as to form a closed circuit in which a current may be indicated. Let also a portion of another wire, connected with a galvanic battery, be placed parallel to the first, and a current sent through it. If the wire transmitting the battery current be suddenly brought near the wire connected with the galvanometer, during the approach of the second wire toward the first a current of the natural electricity of the latter will pass through the galvanometer in a direction adverse to that of the inducing current. 2. The induced current continues only during the motion of the inducing conductor; when the motion of this is stopped, the induced current ceases, and while the current of the battery remains stationary and continues the same in quantity and intensity, no perceptible effect is exhibited in the adjoining wire. 3. When the inducing current is suddenly moved away from the first wire, a current is observed to pass through the galvanometer in the opposite direction to the former induced current, or in the same direction as the battery current. 4. Let the two wires be placed parallel and near to each other, while the circuit of the battery current is interrupted. If in this condition the current from the battery be suddenly established through the inducing conductor, an induced current of electricity will pass through the galvanometer in a direction adverse to that of the battery current; or in other words, the effect will be the same as that of the approach of the battery current to the inducing wire, as in case 1. 5. During the continuance of the battery current of unimpaired strength and intensity, no disturbance of the natural electricity of the adjoining wire is perceived; but at the moment the current of the battery is stopped by a rupture of the circuit, a current passes through the galvanometer in the same direction as that of the current of the battery. All these phenomena are in accordance with the hypothesis that during the transmission of a current of electricity through a wire, there is exerted in space on every side an inductive action diminishing with

the distance which disturbs the natural electricity of any conducting matter which may be brought within its influence; that while the conductor remains at rest within this influence an abnormal equilibrium exists; and when the conductor is removed from this influence, or when the latter ceases, the usual equilibrium is established by a reverse motion. Since, according to the theory of Ampère, magnetism consists of currents of electricity revolving at right angles to the length of the magnetized bar, it follows that analogous results ought to be produced by magnetism; and for this purpose, instead of the battery current in the last series of experiments, let there be substituted a magnetized bar held at right angles to the wire connected with the galvanometer. 1. If this bar be suddenly brought down upon the wire perpendicular to its length, the galvanometer will indicate a current in an opposite direction to the hypothetical current in the lower side of the magnet. If the wire be E. and W. and the magnet be held across it with its N. pole toward the north, the current in the lower side of the magnet will be from the E. to the W., while the induced current will be in an opposite direction, i. e., from W. to E. 2. When the motion of the magnet toward the wire is stopped, the induced current ceases, and no sign of electricity is exhibited so long as the magnet remains at rest. 3. When the magnet is suddenly removed from its proximity to the wire, a current in the opposite direction to that of the first, that is, in the same direction as the current in the lower side of the magnet, is indicated by the galvanometer. 4. When a bar of soft iron is placed across the wire at right angles, and this is suddenly magnetized, either by a galvanic current or by touching its ends to the poles of a horse-shoe magnet, a momentary current is produced in the wire in a direction opposite to that of the hypothetical currents of the near side of the magnet. 5. So long as the soft iron bar remains at rest and its magnetism suffers no change, no current is indicated by the galvanometer; but the moment the bar is unmagnetized a reverse current takes place. The two series of results we have given above are precisely analogous—the latter being merely a case of the former, in which the hypothetical currents of the magnet are substituted for the real current of the battery.—All the effects that we have described are produced with much more intensity, when, instead of using extended wires parallel to each other, we employ wires in the form of spirals, either flat or cylindrical. For example, to obtain an induced current of considerable intensity by means of magnetism, we place on a rod of iron, say 4 inches long, a spool of long wire covered with silk, which may occupy two inches of the length of the middle of the iron. If the two ends of this rod projecting beyond the spool be suddenly brought into contact with the two poles of a horse-shoe magnet, an induced current will be developed for a moment in the surrounding wire; and when the same rod is sud-

denly detached from the poles, a current in an opposite direction will take place; and in this way a continued series of alternate currents may be developed by alternately making and severing the contact of the poles of the magnet and the ends of the rod. A still greater effect may be produced by causing the rod to revolve on an axis at right angles to the middle of its length, before the poles of the magnet, so that each end in rapid succession may be brought in contact first with the N. and then with the S. pole, and so on.—Shortly after the discovery of the laws we have stated, Mr. Joseph Saxton, of this country, then a temporary resident of London, now of the U. S. coast survey, invented the first machine for giving sparks and shocks in accordance with the arrangement we have just described. Instead of a single bobbin of wire on the middle of a straight bar, he employed two, one on each leg of a bar of soft iron bent into the form of a horse shoe, which were made rapidly to revolve by means of a multiplying wheel before the poles of a magnet. At each half revolution the magnetism of the soft iron was entirely reversed, and in this way a series of currents was induced, of sufficient intensity to decompose water, fire combustible bodies, and powerfully to affect the nervous system. An instrument maker in London, who was employed to construct these machines, made a slight change in the arrangement, which principally consisted in placing the inducing horse-shoe magnet in a vertical position, and in causing the spools of wire to revolve in a plane parallel to its flat side, instead of parallel to its poles. This change, instead of improving the instrument, produced an opposite effect, since the strength of the induction was much diminished. The author of it, however, succeeded by advertisements, and an actual exhibition of it in France, in attaching his name to the invention, to the exclusion of that of Saxton. It is, however, gratifying to see that in the German works on the subject, and also in the better class of English publications, justice is done to the original inventor. The next important series of investigations on this subject, after the original discovery of Faraday, was by Professor Henry of Princeton, now secretary of the Smithsonian institution at Washington. He found that at the beginning and ending of a galvanic current in a long wire, an induced current was produced by an action which has sometimes been called the induction of a current on itself. To illustrate this, let the circuit of a small battery of a single element be closed by a short wire of about a foot in length, dipping into a cup of mercury. When the circuit is broken, no spark, or but a very feeble one, will be observed; but if we now substitute for the short wire one of say 100 feet in length and of considerable thickness, a vivid spark will be exhibited when the circuit is interrupted. To obtain this result in the most striking manner, we should employ a copper ribbon at least an inch and a half wide and 100 feet long, well covered with two thicknesses of

silk, and rolled into the form of a flat spiral. At the rupture of a battery circuit of which this forms a part, a loud snap and deflagration of the metal will be produced, when with a short wire, the battery remaining the same, scarcely any but a very feeble spark would be observed. By this arrangement several spires of ribbon react on each other, and increase the effect. By coiling a bell wire covered with silk of 600 or 700 feet in length into a spiral ring, the intensity will be so much increased that shocks may be obtained by means of a small galvanic battery of a single element. If the same wire be coiled into the form of an elongated spiral, and in the centre of this a rod of soft iron be placed, or what is better, a bundle of iron wire, the intensity is still more exalted. In this case the magnetic reaction is combined with that of the current of galvanism, and the two actions being in the same direction conspire to increase the effect. To produce, however, the most powerful inductive apparatus, a bundle of varnished iron wires of about 15 inches in length, and together forming a diameter of about an inch, is surrounded with a coil of thick copper wire well covered with silk of 800 or 400 feet in length. Around this, but separated from it by a cylinder of glass or pasteboard soaked in shell lac, is coiled a fine copper wire of 4 or 5 miles in length, care being taken that each spire be well insulated from every other. When a current of galvanism from a battery of even a single element is transmitted through the thick copper wire which surrounds the inner core or bundle of iron wire, the latter becomes magnetic; and at the instant the rupture is made in the battery current, a sudden cessation of the magnetism, as well as that of the current itself, induces a current of great intensity, though of small quantity, in the outer surrounding fine wire. Each spire of the long wire in this arrangement is subjected to the inductive influence; and the rapidity of motion of the electricity of the wire, were it not for the increased resistance, would be in proportion to the number of spires, or in other words to the length of the wire. This apparatus has received various ingenious improvements, the principle in all cases remaining the same. Dr. Page was the first to invent an apparatus on this plan by which the rupture of the battery current was rendered automatic; the magnetization of the iron core caused the attraction of a small magnet attached to one end of a lever which broke the circuit, and the consequent disappearance of the same magnetism allowed the end of the lever to fall into a cup of mercury and thus again complete the circuit. This instrument was much enlarged and improved by Ruhmkorff of Paris, and has of late been still further perfected by an ingenious American artisan, E. S. Ritchie of Boston. The essential desideratum in the construction of this instrument is the perfect insulation of the several spires of wire, so that the intense electricity which is produced may not strike across from one spire to another; and Mr. Ritchie effected

this by means of an ingenious process of winding, together with an improved insulation. An appreciable time is required to overcome the resistance of the wire and to give it a full charge of the current of electricity, and also to magnetize iron; hence in the instrument we have described, when a single battery is employed, the induced current, which gives the intense spark, is that which is produced at the rupture of the battery current. We can however increase the intensity at the beginning of the current, by employing a battery of a number of elements, which, producing electricity of greater intensity, more suddenly establishes the current in the wire, and more rapidly develops the magnetism of the iron.—*Currents of different Orders.* An induced current, by its action on a third conductor, may produce another current, and this another, and so on. If we call the current of the battery a current of the 1st order, the first induced current is named that of the 2d order, and so on. The discovery and investigation of the principle and properties of currents of the different orders is mainly due to Prof. Henry. On reflecting a little, it will be evident that these currents cannot be produced immediately by placing several straight wires parallel to each other and passing a current of electricity through one of them; in this case the battery current would act on the surrounding wires, and simply produce in each of them an induced current of the 2d order. To obtain, therefore, currents of the different higher orders, we employ a number of flat spirals, through one of which placed horizontally on a table is transmitted the current from the battery. Immediately above this, and separated from it by a stratum of air or a plate of glass, is a 2d flat spiral, the ends of which are connected with a 3d spiral placed at such a distance as to be entirely out of the influence of the battery current. Placing on the 3d a 4th (the two being separated as before by a plate of glass), and joining the ends of this with the ends of a 5th spiral, and so on, we shall have a series of successive currents. The current of the 1st order induced by the battery current induces a secondary current in the 2d spiral, which passes through the 3d spiral, and, thus free from the influence of the battery current, induces a current of the 3d order in the 4th spiral, which in turn, passing through the 5th spiral, induces a current of the 4th order in the 6th, and so on. Since each induced current must have a beginning and an ending, the current of the 3d order must in reality consist of 2 currents in immediate succession and in opposite directions, one produced at the beginning and the other at the ending; and for a similar reason a current of the 4th order must consist of 4 currents in immediate succession and opposite directions. On this account currents of the higher orders do not definitely deflect the needle of the galvanometer, but merely give it a slight tremor; the impulses in opposite directions follow each other so rapidly that the inertia of the needle is not overcome in the in-

terval between the two. The existence therefore of currents of different orders could not be determined by the galvanometer; they however give intense shocks, and also permanently magnetize steel needles. This latter effect will be understood when it is recollected that, although the series of waves in different directions are the same in quantity, they differ very much in intensity; that at the beginning of the agitation they have much the greatest energy. Hence the currents of different orders exhibit dominant impulses in definite directions. If the direction of the battery current be represented by +, the current of the 2d order at the beginning of the battery current will be represented by —; the dominant current of the 3d order +, of the 4th —, and so on; while the series of dominant impulses at the ending of the battery current will be +, +, —, +, —, +. When a circular plate of copper or any other conducting substance is interposed between two spirals placed one above the other, and a current from the battery is transmitted through, for example, the lower one, the induced current at the ending of the current of the battery, in the upper spiral, will affect the galvanometer as if no plate were interposed, while the physiological effect, or the power of giving shocks, will be entirely neutralized. This remarkable effect is due to an induced current in the interposed conductor, which is rendered evident by cutting out a slip of the metal extending from the centre to the circumference of the plate; or in other words, by removing one of the radii of which the circular plate may be conceived to be made up, and thus interrupting the circuit, in which an induced current otherwise could be produced; the shocks with the plate thus cut will be nearly as intense as when the plate is entirely removed. The same effect takes place when instead of the plates a 8d flat spiral is introduced between the 1st and 2d spirals; so long as the ends of this spiral are separated, its presence produces apparently no effect; but if the ends be closed so as to form a perfect circuit which can be traversed by the induced current, the power of giving shocks is neutralized. But the question naturally arises as to how the current in the plate affects the current in the upper spiral so as to destroy its power of giving shocks. The explanation of this is to be found in the fact, that while the current in the battery tends to induce a current both in the plate and in the spiral above it, each of these currents tends to induce an opposite current in the conductor of the other; we may therefore consider the upper spiral as being under the + influence of the current from the battery, and the — influence of the current of the plate; but as the current in the plate produces an equal inductive action in opposite directions at its beginning and ending, the only effect of it will be to prolong the action of the induced current in the upper spiral, or in other words, to diminish its intensity, and hence to neutralize its power to give shocks without perceptibly diminishing its ef-

fects on the galvanometer. These facts are of importance in the construction of the inductive apparatus previously described; for if two points of two adjacent spires of the long wire happen to be in metallic contact, so as to form a closed circuit, the effect is the same as that of the interposition of a plate or spiral between the battery current and the induced current; the intensity of the latter will be neutralized, and hence the necessity of the perfect insulation of the several spires of the long wire. For the same reason, if the iron core be enclosed in a hollow cylinder of copper or any other conducting metal so as to separate it from the outer coil of long wire, the great inductive power of the instrument will be neutralized; and it is also on this account that a bundle of varnished iron wires is employed for the core instead of a solid rod of iron. If however the copper cylinder we have just mentioned be interrupted by sawing out a thin slip parallel to its axis, and the solid iron core sawed down from its circumference to its centre, forming a saw-gash in the direction of the radius and in the plane of the axis, the interfering induced currents will be prevented. We have stated that an induced current of considerable intensity is generated in the conductor of the battery itself at the moment of the rupture of the circuit. This also produces, on the principle of the interposed plate, an adverse action which tends to diminish the energy of the induction apparatus, a defect in the instrument which M. Fessio has remedied by causing the rupture to take place in a cup of mercury the surface of which is covered with oil; the current of the battery is interrupted by drawing the end of the conductor out of the mercury while it still remains in the oil, which being a bad conductor stops in part the induced current. A similar effect is produced by suffering the extra current to expend itself on a large sheet of metal called a condenser. The facts we have here stated have been confirmed and extended by Masson, Verdet, and Abre of France, Dove, Wartmann, Riess, and Lentz of Germany, Marianini of Italy, and De la Rive of Geneva.—*Induced Currents from Discharges of ordinary Electricity.* When a discharge from a Leyden jar is transmitted through two spiral conductors, separated by a pane of glass or a stratum of air, induced currents analogous to those we have described are generated of great intensity, and under favorable circumstances the effect may be exhibited at a great distance. Prof. Henry succeeded in magnetizing needles with induced currents at the distance of several hundred yards, by stretching two long wires parallel to each other, and transmitting a discharge from a Leyden jar through one of them. He also obtained inductive effects of the same kind from the discharges of the thunder cloud at a distance of several miles. The direction of induced currents from discharges of the Leyden jar is apparently very capricious; they do not deflect the needle of the galvanometer, and the direction indicates

by the magnetization of needles, enclosed in a small helix which forms a part of the circuit, is subject to very complex variations; for example, when the two conductors are near each other the direction indicated by the magnetization of the needle is opposite to that of the current from the jar. If the two parallel wires or flat spirals be separated to a greater distance, the magnetization of the needle will indicate either a feeble current or one in an opposite direction; and if the distance be still further increased, the opposite polarity of a greater intensity will be exhibited. A change also in the direction of the magnetization of the needle will be produced by an interruption in the circuit of the induced current, or by the proximity of another closed circuit. These results have led European physicists to attempt to ascertain the direction of the current by chemical decomposition and other effects, but the results do not settle the question or throw much additional light on the character of the phenomena. Prof. Henry, however, after a very extended series of experiments, was enabled to refer them all to the peculiarity of the electrical discharge from the Leyden jar. This does not consist of a single discharge from the inside to the outside of the jar, as has been generally supposed, but in a series of discharges forward and backward alternately, until an equilibrium, as it were, is established by a series of oscillations, decreasing in intensity on account of the resistance of the wire, until the normal electrical equilibrium is attained.—*Induction in Masses of Metal in motion.* Arago in 1824 discovered that when a copper plate is made to revolve rapidly immediately under a magnetic bar freely suspended by an untwisted thread, the motion will be communicated to the latter even through a plate of glass; and also that when a magnetic needle is made to vibrate immediately over a plate of copper, it will come to rest much sooner than when the metal is removed. These facts remained entirely isolated until Faraday showed that they were the results of currents induced in the plate by the action of the magnet. We have seen that when a wire is made to approach at right angles to a magnetized bar, a current is produced in the former opposite to that of the hypothetical current in the near side of the magnet. A similar result must be produced when a plate of metal is moved in the vicinity of a magnetic pole. To illustrate this, let the N. pole of a strong magnetic bar be placed perpendicularly on the middle of an oblong plate of copper, extended in a N. and S. direction; while the bar retains this position, let the plate be drawn in the direction of its length, say southward under the magnetic pole. A magnetic bar thus placed with its N. pole downward has hypothetical currents revolving around it from W. to E. on the N. side, and from E. to W. on the S. side. If the plate therefore be moved southward, the N. part, which is approaching the pole, will have induced in it a current in an opposite direction to that of the current in the

magnet, which will in this case be a current directed toward the W., while the S. part of the plate receding from the magnet will have currents produced in it in the same direction as those in the magnet; but the currents on the S. side of the magnet are moving toward the W., and hence we shall have on both sides of the magnetic pole of the bar currents directed toward the W. during the time the plate is drawn from the N. toward the S. If we reverse the motion of the plate, the direction of the system of currents will also be reversed. If the poles of a horse-shoe magnet be furnished with two pieces of iron so as to form acting poles at a small distance from each other, and nearly in the same line and between these a circular disk of copper be made to revolve on an axis parallel to the line joining the poles, so that the latter shall be near the outer circumference, a system of currents from the centre to the circumference of the plate will be produced; the radii of the plate which are approaching and those which are receding from the line joining the magnetic poles will both conspire to produce this effect. If one end of a galvanometer be brought in contact with the axis of the circular plate, and the other made to touch the circumference while it is thus revolving, a constant current will be indicated by the instrument. If the direction of the revolution of the disk be changed, an opposite current will be produced; or if the velocity of the rotation be increased, a corresponding increase will be observed in the intensity of the current. If the magnet employed in this experiment be one of soft iron and suddenly excited by a galvanic current, the copper disk previously put in rapid motion will instantly be stopped. The current in the radii of the plate which are approaching the magnetic pole, being in an opposite direction to those in the magnet, will be repelled; while those in the radii on the other side of the pole, being in the same direction with the current in the magnet, will be attracted; and hence the resultant action of all the induced currents will be to stop the plate. A similar result is produced when a cube of copper of about an inch in diameter is suspended between the poles of a powerful electro-magnet, and caused rapidly to revolve, from the untwisting of a thread by which it is suspended; when the magnet is suddenly excited, the revolution of the cube is instantaneously arrested, and brought to rest without the least oscillation, as if the momentum and consequently the inertia of the mass were instantly annihilated. If, in the case of the arrangement of the revolving disk we have mentioned, a rapid motion be communicated to it by a train of wheels in opposition to the resistance between the induced currents and the magnet, a considerable exertion will be required to continue the motion; and since, according to the principle of the conservation of force, the muscular power expended must produce some effect, and no change is found in the condition of the metal after the experiment, the conclusion was drawn that the

energy exerted was expended in generating heat, the truth of which was established by Foucault. The disk, thus made to revolve in opposition to the force of the magnet, increases in temperature, and soon becomes sufficiently hot to set fire to an ordinary match.—*The Magnetism induced from the Earth and the Sun.* The earth being a great magnet, currents of electricity must be induced in all conducting material in which motion takes place at its surface. These currents are, however, of feeble intensity, but their existence may be shown by connecting the ends of a copper wire several hundred yards in length, covered with silk and wound around a wooden cylinder of about 2 feet in length, with a galvanometer, and by suddenly turning the axis of the former from a horizontal position into the direction of the dipping needle. During the downward motion of the N. end of the cylinder, the galvanometer will indicate an induced current in an opposite direction to that of the hypothetical current of the earth, and, when the motion is reversed, an induced current in the same direction as that of the current in the earth. From this result it must be inferred that electrical currents are constantly produced by the magnetism of the earth, since no change in the direction and position of a conducting body can take place without developing the inductive action. Moreover, since the sun has been proved to be a great magnet, exerting a powerful action on the earth, the daily rotation of the latter must subject it to an inductive action, similar to that we have described in the revolving plate of copper. There can be no doubt, in the present state of science, that such currents actually do take place, but their direction and intensity have not yet been ascertained. But from the association of the magnetic storms we have previously described with the occurrence of the aurora borealis, and also with that of the maximum number of spots on the sun, we are led to the conclusion that the three classes of phenomena are intimately connected, and that they furnish a subject of cosmical research of perhaps as great interest as any which have ever occupied the attention of the scientific world.

MAGNIFYING GLASS. See **MICROSCOPE.**

MAGNOLIA, a genus of highly ornamental trees, chiefly deciduous, but partly evergreen, and so named in honor of Pierre Magnol, prefect of the botanic garden in Montpellier (1638–1715). The magnolia belongs to the natural order *magnoliaceae*, embracing, according to Don, 10 genera, of which, in North America, the magnolia and tulip tree (*liriodendron*) are the most conspicuous. The foliage of the magnolias consists of large and entire leaves; their flowers are solitary and terminal, very large and highly scented; the stamens and stigmas are numerous; the carpels are disposed in crowded spikes, opening by an external angle, one or two seeded, permanent; the seeds are baccate, somewhat cordate, pendulous, hanging out beyond the capsules by a very long umbilical

cord; the capsules are aromatic, as well as the bark, which possesses bitter, tonic, and febrifugal properties. The magnolias belong to the eastern portions of Asia and North America exclusively. Those of each of these countries are also marked by structural differences in the mode of aestivation. Thus those which are natives of Asia have two opposite spathe-like bracts enclosing the flower buds, the ovaries are somewhat distant from each other, and the anthers burst inwardly. Of these, the yulan magnolia (*M. conspicua*, Salisbury) is a native of China, where it has been cultivated since the year 627. It is said to be naturally a very showy tree, attaining an altitude of 80 or 40 feet, but in gardens it usually reaches only 8 or 10 feet. A specimen, however, in the vicinity of Newburg, N. Y., which in 1850 had been planted out 14 years, is mentioned in Downing's "Rural Essays" as being then 30 feet high; it was grafted upon an American species, which may have favorably affected its growth. In that place the average period of blooming is from the 5th to the 15th of April. In the spring of 1849 there were 8,000 blossoms at once upon the specimen mentioned; and every year, whatever may have been the severity of the previous winter, it affords a fine display of its blossoms, sometimes succeeded by well ripened seeds. The flowers, in color a pure creamy white, in odor deliciously perfumed, combined with the hardiness of the tree, render this species very desirable in ornamental culture. In China, indeed, it holds the highest rank in the garden, being planted in the open ground and allowed to reach its full size, and likewise kept in boxes and pots, and forced throughout the winter, so as to keep up a perpetual supply of bloom in the apartments of the imperial palace. There are several varieties known; but the finest is considered to be Soulange's purple (*M. c. Soulangeana*), having the leaves, wood, and general habit of the original parent, but its blossoms more numerous, rather larger, and more showy, the outside of the petals being finely tinged with purple. It is thought to have originated by an accidental cross impregnation between the yulan and the purple magnolia, which were planted together on a lawn in the grounds of M. Soulange Bodin, the distinguished French horticulturist. The purple-flowered magnolia (*M. purpurea*) is a native of Japan, having deciduous, obovate, acute, reticulately veined, almost smooth leaves, erect flowers of 3 sepals and 6 obovate petals, purple without and white within, very ornamental. This species we have seen standing the winter well on the Hudson river, when cultivated in the garden; but in New England it is usual to treat it as a pot plant, and give it the protection of the greenhouse, a mode adopted in the north of France and Germany. The slender magnolia (*M. Kobus*, De Candolle) is a native of the island of Nippon in Japan, having erect, solitary flowers, similar in color to those of the last; its foliage is deciduous, the leaves obovate, acuminate at both ends, produced

after the flowers, pubescent beneath when young, smooth when adult. It grows to the height of 10 feet, has a rough bark which smells like camphor, and is very ornamental, but requires protection against frost, which injures the blossoming. The purple magnolia of Thunberg, or obovate magnolia (*M. obovata*), is a very elegant shrub 5 feet high, native of Japan, and cultivated in the gardens of China and Japan as an ornamental object. There are 3 varieties known, having red-purple, white, and pure white flowers severally. It is said to thrive best when grown in the conservatory. A middle-sized tree, with large, pale, scentless, campanulate flowers, found indigenous in the fields near Canton in China, is the *M. inodora* of De Candolle. The *fulva-coco* magnolia, as it is called at Macao (*M. coco*, De Candolle), has very large solitary flowers of 8 sepals and 6 fleshy petals, which as well as the sepals are curved inwardly; its color is pure white, and its scent exquisite; the flower bud before expanding is roundish and shaped like the coconut, whence its name. It is a shrub 5 feet high. The lofty magnolia (*M. excelsa*) is a native of Nepal, and is a magnificent tree from 50 to 80 feet high, bearing large, white, sweet-scented flowers; its foliage consists of oblong, elliptical, acuminate, glaucous leaves, netted with veins beneath. The wood is greatly prized by the inhabitants of Nepal, where it is employed in joinery, and commonly sold under the name of *champ*. In color it is of a fine yellow; its grain is close and fine. The brown-flowered magnolia (*M. fuscata*) is merely a shrub 3 or 4 feet high, with evergreen leaves, of elliptical, oblong shape; the flowers are small, very fragrant, and of a dull purple color; it is a native of China, where it is esteemed for its fragrant blossoms. With us it is a greenhouse plant, and a companion of the camellia. There are other Asiatic species mentioned by Don in his "General System of Gardening and Botany" (London, 1831), but he questions whether they belong truly to this genus.—The other division embraces those species which are exclusively American, having the flower bud enclosed in a one-spathed bract, the ovaries approximate, and the anthers bursting inward. The stateliest of the group is the big laurel (*M. grandiflora*, Mx.), the most remarkable of all the trees of North America for the majesty of its form, magnificence of foliage, and beauty of flowers. It sometimes rises to the height of 60, 70, or 80 feet, with a naked, smooth, columnar stem, and the head when not injured by accident is always regularly pyramidal or semi-elliptical. From May till August, in favorable situations, it is almost always covered with its brilliant white flowers terminating the younger branches. Its leaves are entire, oval, acuminate or even obtuse at the apex, 6 or 8 inches long, and borne on short petioles, evergreen, thick, coriaceous, and very brilliant on their upper surfaces. The flowers are 7 or 8 inches broad, white, and of an agreeable odor. The fruit is an oval cone or sort of

strobile, composed of a great number of cells, which, opening longitudinally, show within 3 or 4 vividly red seeds. The timber of the big laurel is best fitted for indoor carpentry, the wood being soft and remarkable for whiteness, and very durable on seasoning. The tree grows naturally in light, rich soils, commonly along the sea coasts of Georgia and Carolina. Its propagation is from seeds, which vegetate readily; and likewise from stools or layers, which require 2 years to put forth roots in sufficient abundance to admit of transplanting. It will not thrive north of New York, not being able to endure the usual cold of the winters. It is quite hardy at Philadelphia, and in various private grounds near that city there are fine specimens of considerable size growing without protection and blossoming every year. Some remarkable specimens are noticed by Loudon as growing under cultivation in Great Britain, France, and Italy; several varieties are known among horticulturists, of which the Exmouth (*M. g. Exoniensis*) is the most distinct; on account of its flowering early and freely, and being rather hardier, it is the most deserving of general culture. The cucumber tree (*M. acuminata*) ranges from New York to Georgia; it is a fine species, sometimes exceeding 80 feet in height, and 3 or 4 feet in diameter at a yard from the ground. Its leaves are 6 or 7 inches long and 3 or 4 inches broad, oval, entire, and very acuminate, deciduous in the autumn and renewed in the spring; the flowers are 5 or 6 inches in diameter, slightly fragrant, the petals scarcely expanding, yellowish white and bluish or glaucous on the outside; the strobiles are 3 inches long, nearly cylindrical, convex on one side and concave on the other, and when unripe looking like a young cucumber, whence is derived the name of the tree; the cells contain each one rosy-colored seed. The wood of the cucumber tree is fine-grained, susceptible of a brilliant polish, and best suited for indoor work. This majestic and symmetrical species, says Darlington, a native of our mountains, is beginning to be appreciated and introduced as an ornamental shade tree. It is so hardy indeed as to thrive in northern Massachusetts, growing perfectly well in the botanic garden at Cambridge. The foliage, though large, is borne upon the very extremities of long bare branches, which deteriorates the general effect which we look for in ornamental forest trees. A much more beautiful tree is the auricle-leaved magnolia (*M. Fraseri*, Walter), found indigenous in the southern states from Virginia to Georgia and Florida. Its usual height is from 30 to 40 feet; its leaves are 8 to 12 inches long, mostly green on both sides, somewhat rhomboidal, acuminate at the summits, but divided into rounded lobes at the base. The flowers are 3 or 4 inches in diameter, white, of an agreeable odor, situated at the extremities of the young shoots; the strobiles are oval, 3 or 4 inches long, and when ripe of a beautiful rose color. The wood is soft, spongy, very light, and unfit for use. The heart-leaved magnolia

(*M. cordata*) is found upon the mountains of North Carolina and Georgia; it is from 20 to 50 feet high, its stem straight, and covered with a rough and deeply furrowed bark like that of a young white oak; its leaves are supported on petioles, 4 to 6 inches long and from 8 to 5 wide, smooth and entire; the flowers are yellow with faint streaks of red on the inside of the petals. The beauty of its yellow flowers, says Michaux, which form an agreeable contrast with its luxuriant foliage, and the advantage of its resisting an intense degree of cold, are its recommendations to amateurs. The large-leaved magnolia (*M. macrophylla*) is the most remarkable for the size of its leaves and flowers. Its trunk grows to a height of 80 or 40 feet, and with the fragile branches is covered with a white bark; the leaves are borne upon the ends of the branches, and measure from one to 8 feet in length; they are acute at the summit, tapering, cordate, scarcely auriculate at base, glaucous beneath, clothed with a silvery, silken pubescence when young. The flowers, when fully expanded, are 8 or 10 inches in diameter, white, the base of each petal having a purple spot inside; the strobile is roseate with scarlet seeds. The umbrella tree (*M. umbrellata*, De Lamarck) grows in every part of the southern states in rich soil, and ranges from northern New York and Pennsylvania southward and westward. This species is remarkable likewise for the dimensions of its leaves and flowers. Its trunk rarely rises above 35 feet, and its habit is more like that of shrubs. The leaves are thin, oval, entire, and acuminate at both extremities, 18 or 20 inches long and 7 or 8 broad; they are often displayed in rays at the extremities of the vigorous shoots, whence the trivial name; the flowers are 7 or 8 inches in diameter, white, composed of several oblong concave petals of an unpleasant sourish odor; the strobiles are conical, 4 or 5 inches long, of a beautiful rose color, with seeds of a pale red; as these soon grow rancid after ripening, they should be sown immediately, if seedlings are wanted. The wood is so soft as to be of little use. This species flourishes in the vicinity of Boston, but from its straggling habit of growth is not very ornamental. The glaucous magnolia, or sweet bay (*M. glauca*), is certainly one of the loveliest shrubs of North America. Its range is from Cape Ann in eastern Massachusetts to Louisiana and Florida. In very sheltered situations it rises into the form of a small tree 20 feet or more high, and Elliott speaks of specimens in the low country of Carolina 50 or 60 feet high; but as it occurs at the north it is usually a bushy shrub having many upright stems from the same root. These stems are erect, smooth, and of a bright green color when young, the leaves of a shining dark green above and glaucous beneath; they fall off on approach of autumn, leaving the stems perfectly bare. The flowers, borne in the bosom of the young leaves at the extremities of the branches, are solitary and seated upon a short thickened peduncle; they appear in succession for many

weeks, beginning to bloom in July. Their color is a creamy white, turning yellowish on fading; the petals of the flower, which are 8 to 14 in number, are enclosed within 8 obtuse spatulate sepals. The fruit (strobile) is a cone consisting of numerous cells, which on opening allow the escape of bright scarlet seeds, each suspended, after the manner of the other species, by an umbilical thread. The fragrance which these blossoms emit is extraordinary, and perfumes the air around to a great distance. The species is not difficult of cultivation, growing readily from its seeds, and even from the suckers removed carefully from the main rootstocks. We have known these latter to succeed admirably on being planted out in prepared borders of peat mixed with sphagnum moss, thus imitating their native soil. It is thus cultivated in many gardens about Boston from plants transferred from the swamps of Gloucester, Essex co., Mass., probably the most northern natural limit. The flowers are gathered by women and children for sale in the railroad cars, and command considerable prices either by the single flower or in bunches of 5 or 6. The glaucous magnolia succeeds well in Europe as an ornamental shrub. It was introduced into England in 1688 by Banister, an early observer of North American plants. Several garden varieties are known abroad, and some hybrids, so called, have been raised, of reputed merit. It seems, however, scarcely possible that any improvement in the beauty of the flower or even in the habit of the plant could be expected from experiment or artificial treatment. It requires a soil so wet as to preclude its general introduction into gardens, where it would be welcomed. The glaucous magnolia has a variety of names. Among others, Kalm tells us, in his "Travels in North America" (London, 1770-77), that the Swedes and English call it beaver tree, because the root of this tree is the dainty of beavers, which are caught by its means. The bark of the glaucous magnolia is bitter, with a strongly pungent taste, which approaches that of sassafras. The aroma resides in a volatile oil, which is probably an essential oil or a variety of camphor. The dry bark affords a bitter extractive substance. As a medicinal article magnolia is to be considered an aromatic tonic, approaching in its character to *cascarilla*, *canella*, &c. Several other species of magnolia resemble the present very closely in their sensible properties, and as far as they have been tried they are similar in their medicinal effects.

MAGNUSSEN, FINNUR, an Icelandic archaeologist, born in Skalholt, Iceland, Aug. 27, 1781, died in Copenhagen, Dec. 24, 1847. He was connected with the most distinguished families of the island. He studied at the university of Copenhagen, returned to Iceland in 1803, and practised as an advocate. In 1815 he was appointed professor at Copenhagen, and in 1819 began to lecture in the university and the academy of

the arts on the old northern literature and mythology. His *Bidrag til nordisk Archaeologie* appeared in 1820, in which he maintained the plastic symbolical idealty of the northern myths, which makes them as appropriate as those of the Greeks for artistic representation. In 1828 he published a *Præcis Veterum Borealiæ Mythologie Lexicon et Gentile Calendarium*. His most important investigations appeared in his translation and explanations of the elder Edda, *Aldre Edda, oversæt og forklaret* (4 vols., Copenhagen, 1821-'8), and in his *Eddalæren og dens Oprindelse* (4 vols., 1834-'6), an exposition of the whole doctrine of the Edda from the standpoint of comparative mythology. In connection with Rafn he produced important works on the historical monuments and archæological remains of Greenland (8 vols., Copenhagen, 1838-'49), and on Russian antiquities (3 vols., 1850-'53). Beside a large number of monographs on special runic and historical subjects, he published in 1841 a large work on runes, entitled *Runes og Runerne*.

MAGOON, ELISHA L., an American Baptist clergyman, born at Lebanon, N. H., Oct. 20, 1810. His grandfather was a clergyman, and a participant in the scenes of the revolution; his father an architect, who after considerable success in his profession was reduced to penury by protracted sickness. At 16 years of age young Magoon was apprenticed to the bricklayer's trade, which he followed till his 20th year, and by the use of the trowel during his vacations, and in the intervals of study, supported himself through a preparatory collegiate and theological course. He was ordained in 1840, and immediately settled at Richmond, Va., as pastor of the 2d Baptist church, where he remained 6 years, and then made the tour of Europe. On his return he became pastor of a church in Cincinnati. Here he remained till 1849, when he removed to New York city and became pastor of the Oliver st. Baptist church. In 1857 he was called to the pastorate in Albany, where he now resides. In 1858 Rochester university conferred upon him the degree of D.D. Dr. Magoon's published works are: "Orators of the American Revolution" (New York, 1848); "Living Orators in America" (New York, 1849); "Proverbs for the People" (Boston, 1848); "Republican Christianity" (Boston, 1849); and "Westward Empire" (New York, 1856).

MAGPIE, a coriaceous bird of the crow family, and the genus *pica* (Bris.). The bill is long and strong, about as high as broad at the base, with compressed sides, hooked tip, and covered with bristly feathers nearly to its middle; wings long and rounded, with the 1st quill short, falcate, and attenuated, and the 4th and 5th nearly equal and longest; the tail is very long and graduated, the lateral feathers scarcely more than half the middle; tarsi longer than the middle toe, strong, and covered with broad scales in front; toes strong, and the hind one long, with curved sharp claws; a naked patch behind and below the eye; head without crest;

nostrils circular. Nearly a dozen species are described, inhabiting the old world and North America; they are seen generally in pairs, but sometimes in flocks, noisy and restless; they will eat vegetables, grains, mollusks, worms, insects, and even carrion, and destroy eggs and young birds. The nest is made upon high trees or in thick bushes, of large size, of coarse materials plastered with clay, and softly lined with wool, hair, and feathers; there is generally a kind of roof over the nest, with a narrow entrance for the birds. The common magpie of Europe (*P. melanoleuca*, Vieill.) is 18 inches long, with an extent of wings of 2 feet, the tail 10 inches, and bill $1\frac{1}{2}$ inches; the plumage of the head, neck, back, anterior part of breast, and abdomen black; rest of the breast and outer scapulars white; the tail and wings splendid with green and purple, most of the inner web of the outer quills white; iris dark. This elegantly formed and handsome bird is generally distributed in the wooded districts of Europe; in form it approaches nearest to the jackdaw, but the wings are shorter and the tail much longer. It is fond of coming near human habitations; the flight is rather heavy, but moderately rapid; the notes are almost incessant and hard; the tail is elevated while walking. The eggs are from 8 to 6, about $1\frac{1}{2}$ by 1 inch, of a pale green with brown and purplish freckles, or pale blue with smaller spots resembling those of the jay; it is fond of building in the same locality, and frequently in the same nest. From its docility it is an agreeable pet, though it has the propensity common to the crow family of stealing whatever objects, and especially bright ones, may attract its attention. The American magpie (*P. Hudsonica*, Bonap.), though closely resembling the European, is a distinct species; it has a much longer tail, is of larger size, with a thicker bill, grayish blue outer ring to the iris, the feathers of the throat spotted with white, and the hind part of the back grayish. It is found in the arctic regions, and, in the United States, from the high central plains to the Pacific, north of California. The yellow-billed magpie (*P. Nuttalli*, Aud.), from California, resembles a small specimen of the preceding bird, and cannot be distinguished from it except that the bill is yellow instead of black; it is by some considered a variety of the common species.

MAGYAR, LÁSZLÓ, a Hungarian traveller, born at Theresienstadt (Hung. Szabadka) in 1817. He attended the naval school at Fiume, entered the Brazilian navy in 1844, and took part in the war between Rosas and Uruguay. He proceeded in 1846 to the Portuguese settlements on the W. coast of Africa, and became commander of the fleet of the negro ruler of Calabar. Having familiarized himself with several negro languages, he left San Felipe de Benguela, Jan. 15, 1849, crossed the table-land of Nano to a comparatively low country, Bihé, where he settled at Maasisikuitu, marrying the daughter of a chief, with whom he received, as he wrote to his father, many

elephants and tiger-hunters, but no gold. On Feb. 20, 1850, he left his new home with his wife and nearly 800 armed men, crossed the river Kokema, arrived in 7 days at the Quanca, ascertained the source of that river, then advanced into the interior, crossed 4 great rivers, explored the forests of Kibokne (Quiboque), and after leaving Karioongo, a village of Bunda, found himself in an elevated tract, which he estimates to be 5,300 feet above the level of the sea, and which he calls the highest land of middle Africa, and the mother of the waters, from the great number and extent of rivers rising there. Crossing the Lumezi, he thence proceeded to the country of the Alunda, or the kingdom of Kalunda; and reaching in 1851 the Oazembe river, he pursued his course with comparative safety, explored the country from E. to W. as far as the Liba river, and thence northward to the city of Matiamvo, testing his observations by travelling over the same region in different directions. In 1851 Magyar suggested that his countrymen might assist him in the enterprise, and through the interference of the Portuguese government, which has promoted him to a high civil office at Loando with the rank of major, the narrative of his travels from 1849 to 1857 was sent to Pesth, and the 1st volume published in 1859 at the expense of the Hungarian academy, and a German translation by Hunfalvy has since appeared. Among the recent communications received from him in Europe is one dated Lueira, Nov. 16, 1858, in which he expresses his gratification at the receipt of some scientific publications, after a residence of 13 years in Africa, and acknowledges the great value of Dr. Livingstone's labors; but having passed over a part of the same ground, he contests the accuracy of some of his statements, and his map (which is also in course of publication) illustrates the points upon which the two travellers are at issue.

MAHANUDDY, a river of Hindostan, rising in the native state of Nowagudda, on the S. W. frontier of Bengal, in lat. 20° 30' N., long. 82° E. It flows first E., then N. E., and finally S. E., through the territory of Nagpoor and the small native possessions on the British frontier, and falls into the bay of Bengal through numerous deltoid arms which divide just below the town of Cuttack, where during the rainy season it is 2 m. broad; its principal mouth is in lat. 20° 20', long. 86° 50'. It is about 550 m. long, and is navigable by boats 460 m. Bishop Heber observed its waters, which being fresh are specifically lighter than those of the sea, floating on the bay of Bengal 2 or 3 m. out from land, "exactly like a river about half a mile broad, smooth, dimply, and whirling."

MAHASKA, a S. E. co. of Iowa, intersected by the Des Moines and the N. and S. forks of Skunk river; area, 576 sq. m.; pop. in 1859, 14,515. The surface consists in great part of level or undulating prairies, diversified with

woodlands, and the soil is productive. Coal and limestone abound. The productions in 1859 were 25,441 bushels of wheat, 841,931 of Indian corn, 7,728 of oats, 11,902 tons of hay, 268,431 lbs. of butter, and 18,064 galls. of sorghum molasses. Capital, Oskaloosa.

MAHMOUD I., sultan of Turkey, a son of Mustapha II., born in Constantinople in 1696, died in Dec. 1754. He was raised to the Ottoman throne in 1730, after the deposition of his uncle Ahmed III. The janizaries, who had revolted against the latter and made Mahmood sultan, exacted from him a promise to continue the war begun against Nadir Shah of Persia. His military operations, however, were disastrous, and he finally concluded a peace in 1736. In 1734 the Russians began hostilities, and in 1737 took Otschakov and Kinburn, while their Austrian allies invaded Wallachia. The latter were however defeated by the Turks at Krotaka on the Danube in 1739, upon which the court of Vienna made peace, on disadvantageous terms relinquishing not only what its forces had recently taken, but also Belgrade, captured during a former war. The Russians obtained a more favorable treaty, retaining all their conquests. In 1743 hostilities again broke out between Persia and Turkey, and were closed by a treaty unfavorable to the latter. Notwithstanding the wars in which his army was engaged, Mahmood was a man of peaceful disposition, and Turkey was comparatively well governed under him.

MAHMOUD II., sultan of Turkey, the younger son of Abdul Hamed, born in Constantinople, Sept. 2, 1789 (or according to some authorities, July 20, 1785), died there, July 1, 1839. During his youth, passed in the seraglio, he became familiar with Persian and Turkish literature, and is said to have manifested at an early age a character of great firmness not unmingled with cruelty. His elder brother Mustapha IV., who ascended the throne in 1807, had ordered him to be put to death as a possible rival, when Ramir Effendi, paymaster of the army, rescued him. Bairaktar, the pasha of Roostchook, raised an insurrection, deposed Mustapha IV., and placed Mahmood on the throne, July 28, 1808. Bairaktar became grand vizier, and with the sultan boldly attempted to carry out those European military reforms for promoting which Selim III., the predecessor of Mustapha, had been deposed. The janizaries, whose organization was threatened by this, rose in rebellion, and stormed the seraglio. Bairaktar blew himself up with his enemies, and Mahmood as a desperate measure ordered Mustapha IV. and his infant son to be strangled, and his 4 pregnant sultanas to be sewn in sacks and thrown into the Bosphorus. After a long struggle, amid pillage and conflagrations, the rebels gained a victory, and the sultan was obliged to submit to their demands. As he was however the only living descendant of Osman, they recognized him as their ruler, dreading the anarchy which must ensue should the royal family become extinct. He now, un-

der very unfavorable circumstances and without resources, continued the war with Russia and the Servians, until, when totally exhausted, his divan concluded a treaty with the Russians at Bucharest, May 28, 1812, by which the Pruth became the boundary of the two empires, the Servians receiving the promise of an amnesty. From this time the daring and despotic character of Mahmoud manifested itself with striking effect, both in reforms at home and in wars abroad. The Wahabees of Arabia were subdued by Ibrahim Pasha. Dreading the increasing power of Ali Pasha of Yanina, Mahmoud made war on him and crushed him in 1822. In 1821 his Greek subjects revolted. By the aid of Mehemet Ali he carried on a successful war against them, but with such extreme cruelty that France, Russia, and Great Britain remonstrated. Their mediation being disregarded by Mahmoud, they attacked and destroyed his fleet at Navarino in 1827. In 1826, after a desperate struggle, in which he displayed great courage and ability, he had overthrown the janizaries, and organized an army on European principles. With full confidence in its power, he did not shrink from a war against Russia, but was defeated, Diebitach even crossing the Balkan, and in consequence of the mediation of England, France, and Prussia, he signed the treaty of Adrianople in 1829. In 1832, Mehemet Ali having refused to withdraw his troops from Syria, which he had occupied as well as Candia, Mahmoud made energetic preparations against him, but was defeated by Ibrahim Pasha at Hems and Konieh, and was only saved by Russian intervention from being dethroned. The result was an alliance for mutual defence between Turkey and Russia. In the mean time Mahmoud had done much to improve the domestic condition of his kingdom. Roads were made, postal communication was established, ambassadors were appointed to the European courts, and women were allowed to appear in public, measures which did not fail to make him many enemies among the conservative party. Justice was speedily and severely administered, and an energetic though unscrupulous police, often aided by the sultan himself, disguised, did much to establish order. But his oppression of all the higher officers of his kingdom, and the frequency with which he plundered, displaced, or slew them, deprived him of trustworthy aid, and his reign was a succession of revolts and treason. He withdrew favor from men of ability to place it in a barber, and in a buffoon named Khalet Effendi, through whose intrigues and selfish advice he oppressed his pashas, and drove many provinces to rebellion. In 1839, being still determined to reduce Mehemet Ali, he made war on him, claiming tribute due. His army was again defeated by Ibrahim, but he died before the news reached him. He was succeeded by his son, the present ruler, Abdul Medjid.

MAHOGANY (*Swietenia mahoganí*, Linn.), a tree of the natural order *cedrelacea*, a native

of South America, Honduras, and the West India islands, and among the most valuable of tropical timber trees. The genus is named in honor of Baron Gerard van Swieten. The mahogany species is a large, spreading tree, with pinnate, shining leaves. The trunk often exceeds 40 feet in height and 4 or 5 feet in diameter. The flowers, in spikes like the lilac, are whitish or yellowish red, and are succeeded by fruit or capsules of an oval form and the size of a turkey's egg. Though the growth is very rapid, the wood is hard, heavy, and close-grained, of a dark, rich, brownish red color. The so called Spanish mahogany, which includes all the above except that from Honduras, is imported in logs about 10 feet long and 2 feet square. The Honduras mahogany is usually larger, the logs being from 12 to 18 feet long, and from 2 to 3 feet square. It is chiefly obtained upon low moist land, and is generally soft and coarse. The trees which grow on rocky elevated grounds are of smaller size, but the wood is harder and more beautifully veined. The coarse variety is much used for a foundation on which to veneer the finer varieties of the wood, and from its spongy nature is well adapted for this purpose, as the glue adheres very firmly to it. The natives make this wood serve many useful purposes, as canoes, handles for tools, &c. Some have supposed the Honduras to be a different species from the Spanish, from its being lighter in color, as well as porous in texture; but it is now ascertained that these differences arise from the different situations in which the trees are found. The largest log ever cut in Honduras was 17 feet long, 57 inches broad, and 64 inches deep, measuring 5,421 feet of inch plank, and weighing upward of 15 tons. The mahogany brought from Africa and the East is decidedly inferior to either of the above; but a fine specimen sent from Calcutta to the great exhibition in London proves that the best quality may be raised in the East India. The Spanish mahogany is considered the most useful of all woods for household furniture, for which it is adapted especially by its durability, beauty, hardness, and susceptibility of polish. Alkalies are often applied to the lighter colored wood in order to deepen the shade, but the best effect is produced by using a colorless varnish which brings out in fresh beauty the rich veins, and leaves its natural tints unchanged. The grain, or curl as it is called, is sometimes so beautiful, that it increases the value of the log to an enormous price; several logs have been sold for over \$5,000 each. In one instance 3 logs, each 15 feet long and 88 inches square, produced from a single tree, brought \$15,000. It is usually a difficult matter for dealers to judge with precision of the worth of the wood in logs. Mahogany is said to have been employed about the year 1595 in the repairing of some of Sir Walter Raleigh's ships, but it was not used for cabinet work till 1720, when a few planks were brought from the West Indies and given to Dr. Gibbons, a physician of London. A man named

Wollaston, being employed by him to make some trifling articles from this wood, discovered its rare qualities, and soon brought it into high repute.—The imports of mahogany into the United States in the year ending June 30, 1859, chiefly from Hayti, Cuba, and Honduras, were valued at about \$264,000, of which \$44,000 worth was reexported, chiefly to England, Sicily, and Russia. Manufactured mahogany was imported to the value of \$14,000, chiefly from France, England, and Mexico.

MAHONING, an E. co. of Ohio, bordering on Penn., drained by the Mahoning and Little Beaver rivers; area, 422 sq. m.; pop. in 1850, 23,785. It has an undulating surface and a highly productive soil. Coal and iron ore are found. The productions in 1850 were 151,110 bushels of wheat, 261,019 of Indian corn, 285,143 of oats, and 288,010 lbs. of wool. There were 10 grist mills, 26 saw mills, 5 iron founderies, 2 woollen factories, 13 tanneries, 58 churches, and 6,670 pupils attending schools.

MAHONY, FRANCIS, an English journalist and author, born in Ireland about 1805. He was sent during boyhood to several Jesuit colleges in France and subsequently to Rome, where he remained for some years, and until he had taken orders. He soon abandoned the clerical vocation to devote himself entirely to literature. He wrote for "Fraser's Magazine," at the time when Maginn, Carlyle, and many other distinguished men contributed to it, "Reliques of Father Prout," since collected in a book (2 vols., London, 1835; 2d ed., 1 vol., London, 1859), which ranks among the most genial works of modern humor. Mahony has been an extensive traveller in Europe and the East, and is an able linguist, versifying with elegance in several languages. He has written several books, but is best known to the English public as a journalist. In 1851 he was examined by the parliamentary committee on the mortmain laws, as regarded their effect in the Papal States. Of late years he has resided in Paris, whence he contributes correspondence to English journals.

MAHRATTAS (*Maha-rashtra*, great people), a people of Hindostan, found chiefly in the Bombay and Madras presidencies. Their primitive territory is said to have included Candelah Baglana and a part of Berar, and to have extended N. W. as far as the river Nerbudda; but they subsequently spread themselves across the whole peninsula, through the present dominions of Holkar, Sindia (Gwalior), and the Guicowar, and the country of Nagpoor, in which they still form an important element in the population. Some writers, however, regard them as foreigners who emigrated from the W. part of Persia about the 7th century, and Pickering assigns them an Arabian or Egyptian origin. They are Hindoos of the Soodra caste, and even their chieftains, who derived their ascendancy from being the head men of villages, be-

longed originally to that low rank; but they are not strict in religious observances, and abstain from no kind of food except beef. Perfidy and cruelty are their most characteristic vices. In personal appearance, though hardy, active, and well proportioned, they are very ill-favored; their stature is small, their skins are dark, and their features irregular. They are much given to athletic exercises, and are excellent horsemen, but their turbulent and predatory habits unfit them for regular military service. The Mahrattas first appear in history about the middle of the 17th century, when they possessed a narrow tract of territory bordering on the Arabian sea and extending nearly from Goa to Guzerat. Sevajee (born 1626, died 1680), the son of an officer in the service of the last Mohammedan king of Bejapoor, was the founder of the Mahratta empire. Having collected an army among the mountains, he overthrew the kingdom of Bejapoor, and gradually united under his own rule the multitude of petty states among which the Mahrattas were divided. His son Sambajee extended his conquests, but was finally put to death by Aurungzebe. Under Saho, grandson of Sevajee, the prime minister or peishwa and the paymaster-general divided the empire between them; the former establishing at Poonah an actual supremacy over the confederate Mahratta states, and the latter founding the new kingdom of Nagpoor. Guzerat, where subsequently arose the independent power of the Guicowar, Orissa, and a great part of Malwah, were overrun by the Mahrattas, and in 1758 they made themselves masters of Delhi. Defeated however by Ahmed Shah Douranee in the great battle of Paniput (1761), their downfall began; and though they again obtained a footing in Delhi (1771), they lost valuable possessions to the armies of Tippoo Sahib, and were driven from the Mohammedan metropolis by the British in 1803. A few years later two other Mahratta chiefs, Holkar and Sindia, who had founded independent states at Indore and Gwalior, entered into a confederacy with the peishwa and the Berar rajah against the British. After a protracted war the Mahratta power was finally overthrown (1819), the peishwa became a prisoner, and his title and authority were abolished.

MAI, ANGELO, an Italian scholar and cardinal, born at Schilpario, a village of the province of Bergamo, March 7, 1781, died at Albano, Sept. 8, 1854. At the age of 17 he entered the novitiate of the society of Jesus. In 1813 he was named an associate of the Ambrosian college, and soon after one of the sixteen attached to the Ambrosian library. When the society of Jesus was formally revived by Pope Pius VII. in 1814, Mai, who had never taken the solemn vows of the order, was induced to remain a member of the secular clergy. In 1819 he became chief keeper of the Vatican library at Rome, soon after librarian, in 1823 supernumerary prothonotary apostolic, and in 1838 prefect of the congregation of the Index

and cardinal. His literary reputation was established by his careful exploration of the Ambrosian library, and by several important discoveries in the then almost unknown department of palimpsests, or rewritten manuscripts. Among his discoveries in Milan were fragments of the orations of Cicero *pro Scauro*, *Tullio*, *Flacco*, and in *Clodium* (Milan, 1814); several orations of Cornelius Fronto, and several letters of the emperor Marcus Aurelius and of Lucius Verus (Milan, 1815; new ed., Rome, 1846); a fragment of 8 orations of Q. Aurelius Symmachus (Milan, 1815; new ed., Rome, 1846); the complete oration of Iseus on the inheritance of Cleonymus (Milan, 1815); an oration of Themistius (1816); several books of the "Roman Antiquities" of Dionysius of Halicarnassus (1816); an *Itinerarium Alexandri*, and a work of Julius Valerius, *Res gestæ Alexandri* (1817); fragments of Eusebius and Philo, and of Eusebius's *Chronicorum Canonum Libri duo* (1818), which he restored in conjunction with Dr. Zohrab from an Armenian manuscript; and fragments of the Iliad from the oldest known manuscripts (Milan, 1819). He also discovered at Rome the long-sought work of Cicero, *De Republica* (Rome, 1822). As keeper of the Vatican library, Mai resolved to publish collections of the unpublished sacred as well as profane authors from the Vatican manuscripts, similar to those of Muratori, Mabilion, and Montfaucon, leaving to future scholars the task of critically editing, commenting, and translating. On this plan he commenced in 1825 the magnificent *Scriptorum Veterum Nova Collectio e Vaticanis Codicibus edita* (10 vols. 4to., Rome, 1825-'38), which was followed by *Auctores Classici e Vaticanis Codicibus editi* (10 vols. 8vo., 1828-'38), and the *Spicilegium Romanum* (10 vols., 1839-'44). His last publication, *Nova Bibliotheca Patrum* (6 vols., 1845-'53), forms an indispensable supplement to almost all collective editions of the church fathers. He had also prepared an edition of the celebrated biblical *Codex Vaticanus*, but died before the completion of the work, which was published by Vercellane (Rome, 1857).

MAIDSTONE, a municipal and parliamentary borough and market town of Kent, England, situated on the right bank of the Medway, 27 m. W. by S. from Canterbury, and 56 m. S. E. from London by the south-eastern railway; pop. in 1851, 20,801. The principal manufacture is of paper. The great parish church of All Saints, erected in the 14th century, and now splendidly restored, is one of the largest edifices of the kind in England. There are many good schools, one of which, All Saints college, founded in 1846, is kept in the building of the old college of All Saints, suppressed by Edward VI. The navigation of the Medway has been of late improved, so that vessels of above 70 tons can now reach Maidstone, and its traffic has been thereby greatly increased.

MAILATH, JÁNOS NEPOMUK, count, a Hungarian author, born in Pesth, Oct. 5, 1786, died by his own hands, Jan. 8, 1855. He was employed in the public service of Hungary until a disease of the eyes compelled him to relinquish his position; and resuming it at a subsequent period, he was finally thrown out of office by the revolution of 1848. Poverty induced him to emigrate with his daughter Henrietta to Munich; and to escape becoming a burden to their friends, father and daughter drowned themselves in the lake of Starnberg, an event which created great sensation in the Austrian empire. He was much respected for his generous qualities, and published a "History of the Austrian Empire," a "History of the Magyars," and other works, all in German, including original poems and numerous translations from the Hungarian, among others the masterpiece of Eötvös, the "Village Notary."

MAIMBOURG, LOUIS, a French historian, born in Nancy in 1610, died in Paris, Aug. 13, 1686. At the age of 16 he entered the society of Jesus, and was sent to Rome to study theology. On returning to France, he became professor of belles-lettres in the college of Rouen, and was afterward appointed to the office of preacher. In 1682 he was expelled from his order for defending the tenets of the Gallican party; but Louis XIV. settled a pension on him. He spent his latter days in the abbey of St. Victor in Paris, engaged in literary pursuits, and at the time of his death was writing a history of the English reformation. The most important of his works are histories of Arianism, of the iconoclasts, of the schism of the Greeks, of the great schism of the West, of Lutheranism, of Calvinism, and of the league. A uniform edition of Maimbourg's histories was published in 1686-'7 (14 vols. 8vo., Paris).

MAIMONIDES, MOSES (Heb. *Rabbi Mosheh ben Maimon*, commonly abridged into the initial name *RaMBaM*; Arab. *Abu Amran Musa ibn Abdallah ibn Maimon Al-kortobi*), a Jewish theologian and philosopher, born in Cordova, Spain, March 30, 1135, died in Cairo, Egypt, Dec. 18, 1204. He was the descendant of a family distinguished in the annals of the Jewish community of his native city, at that period a principal seat of Arabic learning, and received from his father Maimon, who made himself known as a theological and astronomical writer in Arabic, a superior education. His energetic, inquiring, and logical spirit early embraced the whole range of the scientific studies of his time, and he had hardly reached the age of manhood when he was distinguished by a rare proficiency in mathematics, astronomy, medicine, philosophy, and theology, as well as by a surpassing ability as a writer in Arabic and Hebrew. Few particulars, however, are known of his earlier life. Of his teachers, the celebrated Averroes became his friend. In consequence of the great persecution of Jews, Christians, and sectarian Mohammedans by the dynasty of the Almohades in Cordova, he re-

tired with his father to north-western Africa; but meeting there with the same spirit of fanaticism, he finally went to Egypt in 1165, passing through Acre and Jerusalem, where his father died, and establishing himself in Mitra or Fostat (Old Cairo). Here he maintained himself for some time by trade, but soon after found ample opportunity to display his scientific acquirements, and was appointed physician to the court of the sultan Saladin, which office he also held under two successive reigns. At the same time he was active as a rabbi in the Jewish congregation of Cairo, and especially as a theological teacher, his fame for knowledge, purity of character, benevolence, and piety attracting numerous pupils not only from the surrounding regions of the East, but also from the most distant countries of the West. But he exercised a far more powerful influence upon his brethren by his numerous writings, with few exceptions in Arabic, almost all of which have since been acknowledged as standard works. The most distinguished Hebrew translators of the age vied in spreading his masterpieces all over the Jewish world, and thus enabled him to become almost the second lawgiver of his people, and to inaugurate among them a period of literary and philosophical activity, which is still regarded as the golden age of the Jews in exile. Of his works, of which numerous original MSS. are extant in the libraries of Oxford, Rome, Parma, &c., embracing among others treatises on medicine, mathematics, and astronomy, the most frequently reprinted (in Hebrew translations or original) are: *Perush hamishnah* ("Commentary on the Mishnah"), including an introduction and an ethical treatise known under the title of *Shemonah perakim* ("Eight Chapters"); *Sefer hamitzvot* ("The Book of the Commandments"), a systematic compend of the biblical commandments, both positive and negative, according to the rabbis amounting to the number of 613; *Sefer hakiggayon* ("The Book of Logic"); *Mishneh torah* ("The Copy of the Law"), a general code of Jewish observances, written originally in Hebrew, in many respects the most extraordinary strictly rabbinical production, generally known under the appellation of *Yad hasakah* ("The Strong Hand"), from its 14 divisions, *Yad signifying hand and fourteen*;" and *Moreh nebukhim* ("The Guide of the Erring"), a philosophy of Judaism, which from its influence on the development of Jewish science and genius is the most important production of the author, and of which the original Arabic text, in Hebrew letters, from an Oxford manuscript, with a French translation and notes by S. Munk, is now in course of publication at Paris (*Le guide des égarés, traité de théologie et de philosophie par Moïse ben Maimoun*, 8 vols.). Some of the views of Maimonides having been violently attacked by various western rabbis, his orthodoxy and the rights of philosophy in the synagogue were vindicated among others by his learned son and successor as physician to the Egyptian court, Abraham ben Moses.

MAINE, one of the eastern states of the American Union, and the tenth admitted under the federal constitution, situated between lat. 42° 57' and 47° 32' N., and long. 66° 52' and 71° 06' W.; extreme length N. and S. 308 m., extreme width 212 m.; average length about 200 m., average width about 160 m.; area, 31,766 sq. m., or 20,830,240 acres, being 1.08 per cent. of the whole territory of the United States in 1850. It is bounded N. W. and N. by Canada, E. by New Brunswick, S. E. and S. by the Atlantic ocean, and W. by New Hampshire. As established by the treaty of Washington, the boundary on the E. is the St. Croix river and a line running due N. from a monument at its source to St. John river; on the N. the line follows the St. John and St. Francis rivers to a monument at the outlet of Lake Pohenagamook, and in the N. W. it follows the highlands from the said lake in a S. W. direction to the N. E. corner of New Hampshire. Maine is divided into 16 counties, viz.: Androscoggin, Aroostook, Cumberland, Franklin, Hancock, Kennebec, Knox, Lincoln, Oxford, Penobscot, Piscataquis, Sagadahoc, Somerset, Waldo, Washington, and York. The cities of Maine are Augusta, Bangor, Bath, Belfast, Biddeford, Calais, Gardiner, Hallowell, Portland, and Rockland; and the principal towns and villages are Camden, Eastport, Ellsworth, Frankfort, Kittery, Lewiston, Old Town, Saco, Thomaston, Waldoborough, Waterville, and Wiscasset. Augusta, Kennebec co., at the head of natural navigation on the Kennebec, is the seat of government.—The population of Maine, according to the federal enumerations, has been as follows:

Date of Census.	White Persons.	Colored Persons.	Total Population.
1790.....	96,009	588	96,597
1800.....	150,901	818	151,719
1810.....	227,735	999	228,734
1820.....	297,840	995	298,835
1830.....	398,988	1,192	399,453
1840.....	500,438	1,353	501,791
1850.....	551,718	1,356	553,169

Decennial increase: 1790–1800, 57.16 per cent.; 1800–'10, 50.74; 1810–'20, 30.45; 1820–'30, 33.89; 1830–'40, 25.62; 1840–'50, 16.22. Ratio of population to the square mile in 1850, 18.86; to the total population of the United States, 2.51 per cent. Of the white population in 1850, 296,745 were males and 285,068 females; of the colored, 736 were males, 620 females, 895 blacks, and 461 mulattoes. Families, 103,837; dwellings, 95,802. Deaf and dumb, 266; blind, 198; insane, 561; idiotic, 577. Ages: under 1 year, 13,995; 1 and under 5, 61,781; 5 and under 10, 74,453; 10 and under 15, 71,748; 15 and under 20, 67,025; 20 and under 30, 99,995; 30 and under 40, 69,731; 40 and under 50, 53,855; 50 and under 60, 35,194; 60 and under 70, 20,782; 70 and under 80, 10,495; 80 and under 90, 3,455; 90 and under 100, 332; 100 and upward, 18; unknown, 820. Of the total population, 551,129 were native-born, 81,456 foreigners, and 584 of unknown origin. Of those born in the United

States, Maine furnished 517,117, Massachusetts 16,585, New Hampshire 18,509, Vermont 1,177, and New York 978; and of foreigners, Great Britain 16,412 (Ireland 18,871), British America 14,181, Germany 380, and France 148. Of the male population over 15 years of age (162,711), there were employed in commerce, trade, manufactures, mechanic arts, and mining, 38,247; in agriculture, 77,082; in labor not agricultural, 26,833; in the army, 114; in sea and river navigation, 15,649; in law, medicine, and divinity, 2,212; in other pursuits requiring education, 1,727; in government civil service, 419; in domestic service, 282; in other occupations, 196. The number employed in manufacturing establishments was, in 1820, 7,643; in 1840, 21,879; and in 1850, 28,078. Births in 1849—'50, 12,995; marriages, 4,886; deaths, 7,582.—The coast extends in an E. N. E. direction, from Kittery point on the W. to Quoddy head on the E., about 278 m. in a straight line; but following its exact outline, and including the islands, the length of shore line is 2,486 m. It is studded with numerous islands, and indented by many bays and inlets, forming excellent harbors. The largest island is Mount Desert, having an area of 60,000 acres, and lying on the W. of Frenchman's bay. Its formation is very peculiar and its scenery picturesque and striking. Thirteen peaks, the highest variously estimated at from 1,480 to 2,800 feet high, rise from its surface from W. to N. Beside this, the principal islands are Isle au Haut, off the entrance of Penobscot bay, in which are Deer, Long, and Fox islands, and the Isles of Shoals, a group of 8 belonging partly to New Hampshire. Among the largest bays are Passamaquoddy, Machias, Pleasant, Frenchman's, Penobscot, Muscongus, Casco, and Seco. Maine is abundantly supplied with water courses. The Woolastook, flowing into the St. John on the N., and the Aroostook on the E., each with numerous tributaries, drain the N. portion of the state. The Penobscot, flowing into Penobscot bay, is the largest river, draining with its branches and connecting lakes the centre of the state, and navigable for large vessels to Bangor, 60 m. from its mouth. The Kennebec, W. of the Penobscot, affords great and valuable water power, and is navigable for ships to Bath, 12 m. from its mouth. Further W. are the Androscoggin and Saco. Several of the rivers have falls of considerable note. Scattered over the surface of the state are a great number of lakes, the largest of which is Moosehead, 35 m. long and from 4 to 12 m. wide; among others are Umbagog, Sebec, Chebecook, Sebodic, Baskahegan, Long, Portage, Eagle, Madawaska, Millikonet, and Sebago.—The surface is generally hilly, mostly level toward the coast, but rising in the interior. A broken chain of eminences, apparently an extension of the White mountains of New Hampshire, crosses the state from the W. to the N. E. terminating in Mars hill on the borders of New Brunswick. The highest elevation in the range is Mount Katahdin, more than 5 000 feet

above the level of the sea. Saddleback, Bigelow, Abraham, North and South Russell, and Haystack are among the others best known.—Maine is almost exclusively a region of the azoic rocks. The W. portion of the state is granitic, and numerous quarries of excellent granite are worked along the coast for the supply of cities in more southern states. Many of these quarries are directly accessible by ships. The metamorphic rocks abound in a great variety of interesting minerals, and some localities are famous among mineralogists, as Paris, Oxford co., for its beautiful colored tourmalines; Parsonsfield, York co., and Phippsburg, on the coast of Lincoln co., for varieties of garnet and various other minerals; Brunswick and Topsham for feldspar, &c.; and Bowdoinham for beryls. Over the surface of the country the drift formation is everywhere spread in the form of bowlders and sand and gravel. Even upon the highest summits are found scattered rounded fragments of formations situated in places further N. Along the S. portion of the state deposits of tertiary clays are found in many localities beneath the drift. They are characterized by beds of shells of the common clam and mussel, and consequently belong to the newer pliocene. They extend into the interior as far as Augusta and Hallowell, and are penetrated by wells sunk 50 feet or more below the surface. Limestone quarries are worked in many places among the metamorphic rocks. Thomaston, at the mouth of Penobscot bay, has for many years furnished from its extensive quarries supplies of lime for a large portion of the Atlantic seaboard and the gulf of Mexico. (See LIME.) Argillaceous slates of excellent quality are worked for roofing slates at several towns on the Piscataquis, a branch of the Penobscot. Along the shore of Passamaquoddy bay are beds of red sandstone, probably of the age of the Connecticut river sandstone. It is penetrated by dikes of trap, and at the contact of the two rocks are developed many interesting minerals. On Campbell's island and on the shores of Cobscook bay veins of galena are found of some promise at the contact of trap dikes and argillaceous limestone. Trap abounds in this portion of the state, and in the interior it forms hills of considerable extent. The sources of the rivers are in a wild mountainous territory spreading over the central portion of the state. The mountains are in scattered groups, with no appearance of regular ranges. Their structure is of the metamorphic rocks; and so far as explored they present little of economical importance. On the Aroostook are numerous beds of limestone and one large body of red hematite. Another similar bed of this ore has been worked since 1848 at Woodstock, New Brunswick, near Houlton in Maine. Argillaceous slates and limestones prevail over the N. portion of the state. But few attempts have been made in Maine to work metallic ore. A blast furnace was run for some years with bog iron ores on the Piscataquis, and another was

in operation for a short time at Shapleigh in York co., working bog area.—The climate is one of extremes. In the year the temperature ranges between 20° or 80° below to 100° above zero; and the isothermal lines vary with the latitude from 37° to 45½° F. At Fort Kent, at the mouth of Fish river on the St. John, lat. 47° 15', elevation 575 feet, the mean annual temperature of 1842-'5 was 37.04°; at Hancock Barracks (Houlton), lat. 46° 07', elevation 620 feet, 1829-'45, 40.51°; at Fort Sullivan (Eastport), lat. 44° 54', elevation 70 feet, 1822-'53, 43.02°; and at Fort Preble (Portland), lat. 43° 39', elevation 20 feet, 1824-'53, 45.22°. The mean temperature of the seasons was as follows:

Localities.	Spring.	Summer.	Autumn.	Winter.
Fort Kent.....	35.42°	61.68°	39.68°	11.26°
Hancock Barracks.....	38.15°	58.33°	43.15°	16.41°
Fort Sullivan.....	40.15°	60.50°	47.59°	22.90°
Fort Preble.....	42.77°	65.54°	48.16°	24.70°

The fall of rain at the several stations named above was annually 36.46, 36.97, 39.39, and 45.35 inches, and in the different seasons as follows:

Localities.	Spring.	Summer.	Autumn.	Winter.
Fort Kent.....	5.46	11.45	9.64	9.71
Hancock Barracks.....	7.02	11.92	9.95	7.48
Fort Sullivan.....	8.99	10.05	9.65	10.61
Fort Preble.....	12.11	10.28	11.98	10.93

The winters in Maine are severe, but the temperature is uniform and not subject to violent changes, and the climate is considered very favorable to health. The snow lies on the ground for from 3 to 5 months. The N. E. winds from the Atlantic in the spring and early summer charged with cold fogs are, if not unhealthy, at least unpleasant features in the climate of the state.—The soil varies greatly, being sterile in the mountains and fertile in the valleys; the most productive land lies between the Kennebec and Penobscot and in the valley of the St. John. Great forests cover the centre and N. portion of the state, yielding immense quantities of timber, which constitutes the principal source of wealth. The most prevalent trees are the pine, spruce, and hemlock; maple, birch, beech, and ash are common, and the butternut, poplar, elm, sassafras, and a variety of others are found in particular districts. Apple, pear, plum, and cherry trees thrive, but the peach has not been cultivated with success. The dense forests still afford retreats for the moose and caribou, fast disappearing to the more inaccessible regions. There are also the bear, deer, wolf, catamount, wolverene, beaver, marten, sable, weasel, raccoon, woodchuck, squirrel, &c. Wild geese and ducks, eagles, hawks, partridges, pigeons, owls, quails, crows, and humming birds are among the most common birds. The waters off the coast abound with fish, chiefly cod, herring, and mackerel; and salmon, trout, pickerel, &c., are found in great abundance in the lakes and rivers.—The industry of Maine is principally directed to lumbering,

ship building, and agriculture. The trees are felled in winter and dragged on the snow to the banks of the rivers, down which they are floated to the saw mills in the spring; and this occupation employs a great number of men. In ship building Maine ranks first among the states, and builds about a third of the whole tonnage. In 1850 the total tonnage built amounted to 91,212 tons; in 1859 to 40,905; but in 1855 it amounted to 215,904 tons. Bath, Waldoborough, Portland, Passamaquoddy, Belfast, Wiscasset, &c., are the chief ship building districts. In 1850 there were 2,039,596 acres of improved and 2,515,797 of unimproved lands in farms, of which there were 46,760; cash value of land, \$54,861,748; of agricultural implements and machinery, \$2,284,557; of live stock, \$9,705,726. In 1849-'50 the products consisted of 296,259 bushels of wheat, 102,916 of rye, 2,181,037 of oats, 1,750,056 of Indian corn, 151,731 of barley, 104,528 of buckwheat, and 3,436,040 of potatoes; hay, 755,889 tons; hops, 40,120 lbs.; clover seed 9,097, and other grass seed 9,214 bushels; peas and beans, 205,541 bushels; beeswax and honey, 189,618 lbs.; flaxseed, 580 bushels; flax, 17,081 lbs.; maple sugar 93,542 lbs., and molasses 8,167 galls.; silk cocoons, 252 lbs.; wine, 724 galls. In 1850 the live stock of the state consisted of 41,721 horses, 55 asses and mules, 133,556 milch cows, 83,893 working oxen, 125,890 other cattle, 451,577 sheep, and 54,598 swine; and the products of animals in the year preceding were 3,248,811 lbs. of butter, 2,423,454 of cheese, and 1,364,034 of wool. The average production of wheat to the acre was 10 bushels, rye 11, Indian corn 27, oats 20, potatoes 120, and barley 20. In relation to the total product of the United States, Maine produced of wheat 0.39, Indian corn 0.80, and wool 2.6 per cent. The value of home-made manufactures in 1850 was \$804,397; in 1840, \$513,599. The total value of agricultural products in 1840 was \$14,725,615, and in 1850 \$14,282,347.—In 1850 Maine contained a total of 3,977 manufacturing establishments, in which were employed a capital of \$14,700,452, and 38,078 persons, viz., 21,857 males, and 6,222 females. The raw material used was valued at \$13,555,806, and the cost of labor was \$7,502,916. The value of manufactured products was \$24,664,135; in 1830 it was \$7,043,778, and in 1840 \$18,244,504. Among the industrial establishments were 13 cotton mills, with a capital of \$3,329,700, employing 780 males and 2,959 females, and producing \$2,596,856; 36 woollen mills, capital \$467,600, employing 310 males and 314 females, and producing \$753,300; 26 iron works, capital \$364,000, with 313 hands, producing \$277,616; and 263 fisheries, capital \$496,910, hands 2,733, products \$569,876. In 1850 the exports of Maine amounted to \$1,556,912, and in 1859 to \$3,240,839; in 1855 they amounted to \$4,851,207. The imports in 1850 amounted to \$356,411, and in 1859 to \$3,157,086; in 1855 they were \$2,927,443. In 1850 and 1859 the shipping entered amounted to 143,186 and 179,661 tons, and that

cleared to 202,187 and 282,781 tons. In 1855 the entrances amounted to 199,178, and the clearances to 313,840 tons. The year 1859 was an unfavorable one for comparison, and hence the year 1855 is quoted. The shipping owned in the state in 1850 was 501,421 tons; in 1855, 806,604 tons; and in 1859, 739,836 tons. Of the total in 1859, 438,880 tons was registered, and 305,956 tons enrolled and licensed. Of a total tonnage of 747,406 in 1858, 224,657 was employed in the coasting trade, 56,841 in the cod fishery, and 11,056 in the mackerel fishery.—The principal railroads, with their length and cost, are as follows:

There are other lines in progress, as the European and North American, which will extend eastward from Bangor to and through New Brunswick, and to Halifax in Nova Scotia; the Penobscot railroad, &c. The principal towns are connected by lines of telegraph with the West and South, Newfoundland on the E. and Canada on the N., and with each other. Lines of steamers ply regularly between the larger cities and Boston. The total length of post routes in the state in 1858 was 4,866 m., of which 486 m. was by railroad, 2,279 by coach road, and 2,096 by roads not specified.—The number of banks in the state in 1850 was 32, and on Jan. 1, 1859, 68. The statistics of these institutions for the two periods was as follows: capital, \$3,248,000 and \$7,408,945; loans and discounts, \$3,330,230 and \$11,815,127; real estate, \$778,955 and \$145,565; specie, \$475,589 and \$663,734; all other assets \$966,390 and \$1,478,896; circulation, \$3,654,208 and \$3,886,539; deposits, \$1,223,671 and \$2,382,910; other liabilities, \$46,291 and \$179,858.—The government of Maine is founded on the constitution of 1820. Every adult male citizen of the United States, not a pauper or criminal, who has resided in the state 3 months, is entitled to vote at elections. The legislature is composed of a senate of 31 members and a house of representatives of 151 members, all elected annually by the people. The general election is held on the 2d Monday in September, and the legislature meets at Augusta on the 1st Wednesday in January annually. The governor (salary \$1,500) is also elected annually, and is assisted in his executive duties by a council of 7 members,

elected on joint ballot by the legislature. The secretary of state (salary \$900) and the state treasurer (salary \$1,600) are also elected by the same body and in the same way. The judiciary consists of a supreme judicial court, probate courts in the several counties, each with a judge and register, and municipal and police courts in the cities of the state. The supreme court is composed of a chief and 7 associate justices (salary of each \$1,800), the attorney-general (salary \$1,000), and a reporter of decisions (salary \$1,000); courts are held in 3 districts, denominated the western (Portland), middle (Augusta), and eastern (Bangor), for the purpose of hearing and determining questions of law and equity; all other cases are tried in the counties in which they originate. The total resources of the treasury in 1858 amounted to \$505,124, and the expenditures to \$456,701. The chief sources of income are direct taxes, the bank tax, sales of land, &c. On Dec. 31, 1858, the funded debt of the state was \$699,500, trust funds \$326,699.97, and debts due \$97,877.65; total liabilities, \$1,124,077.62. The value of taxable property in the state in 1850 was \$96,768,868, and in 1855 \$131,128,186.—In matters of public education, Maine ranks before all others of the United States. In 1850 one in every 3.1 of its population had attended school. The condition of the schools on June 1 of that year was as follows: 1, public schools 4,042, with 5,540 teachers, 192,815 scholars, and annual income \$315,436; 2, academies and private schools 181, with 232 teachers, 6,648 scholars, and income \$199,745; 3, colleges 3, with 21 teachers, 282 scholars, and income \$14,000. The number of persons over 20 years of age unable to read and write was 6,282. The public schools are supported from the proceeds of a permanent school fund, a tax of 1 per cent. on all bank capital, and by local town taxes. The school fund amounted in 1858 to \$149,085.48. In 1858 there were 4,521 public schools in the state, and the number of children between 4 and 21 was 240,739; scholars in summer schools, 182,183; in winter schools, 154,860; teachers, 2,828 male and 4,506 female. Amount raised for schools by taxes, \$402,761; received from the state \$82,698, and from local funds \$14,286; aggregate expended for school purposes, \$623,699. The collegiate establishments of Maine are: Bowdoin college at Brunswick, founded in 1794; Waterville college at Waterville, 1820; and the Maine medical school at Brunswick, 1820. There is also a theological seminary, under Congregational auspices, at Bangor. Bowdoin college has (1860) 14 professors, and its libraries amount to 30,000 volumes; Waterville college, 5 professors and 16,000 volumes; the medical school, 6 professors; and the theological seminary, 3 professors and 7,000 volumes. The number of churches in the state in 1850 was 945, with accommodations for 821,167 persons, and valued at \$1,725,845. Of the churches, 826 belonged to the Baptists, 199 to the Methodists, 180 to

the Congregationalists, 60 to the Universalists, 26 to the Friends, 15 to the Unitarians, 12 each to the Christians and Roman Catholics, 9 to the Episcopalians, 7 to the Presbyterians, 2 to the Swedenborgians, and 2 to other sects; and 73 were union and 22 free churches. The Baptist churches had accommodations for 101,389, the Congregational 70,623, the Methodist 59,421, and the union churches 23,527. The public press in 1850 comprised 49 separate publications, circulating annually 4,203,064 copies; of these, 4 (issuing 964,040 copies) were published daily, 5 (802,900) tri-weekly, 39 (2,906,124) weekly, and 1 (30,000) monthly; and 15 (987,246 copies) were literary and miscellaneous, 29 (2,501,680) political, 4 (488,568) religious, 1 (275,600) scientific. The number of libraries other than private in the state in the same year was 236, containing 121,969 volumes; of these, 77 (51,439 vols.) were public, 11 (2,225) school, 131 (26,988) Sunday school, 8 (39,625) college, and 9 (1,692) church libraries. Within the year ending June 1, 1850, the whole number of paupers supported in whole or part was 5,503, and the number then on the lists was 3,535; annual cost of support, \$151,664. The number of criminals convicted in the same year was 744, and the number in prison on June 1, 1850, was 100. The principal institutions supported in whole or part by the state are the insane asylum at Augusta, the state reform school at Cape Elizabeth, and the state prison at Thomaston.—Maine was visited in 1602 by Gosnold, in 1603 by Martin Pring, in 1604 by the French under De Monts (who wintered near the present site of Calais on the St. Croix, and in the following spring took possession of the shores of the Kennebec), and in 1605 by Capt. George Weymouth. In 1607 the Plymouth company, having obtained a grant which included this territory, sent out a colony under George Popham and Raleigh Gilbert, but it remained only one year. In 1613 a French colony fitted out by Mme. de Guercheville, a pious Catholic lady to whom had been transferred the patent of De Monts, landed at Mount Desert, with the purpose of founding a centre for missionary operations. The Virginia magistrates, however, sent an armed force which dispersed the emigrants and destroyed their settlement. In the following year Capt. John Smith arrived at Monhegan island, and went at once to the river Sagadahoc or Kennebec, where he trafficked profitably with the Indians, exploring the coasts, and compiling a short history of the country. Several unsuccessful attempts to plant colonies were made during the succeeding years under the auspices of the Plymouth company, no circumstance perhaps proving more disastrous to these enterprises than the treacherous and cruel treatment of the Indians by the whites. In 1620 Sir Ferdinando Gorges obtained a new patent from James I., granting to the Plymouth company all the country between lat. 40° and 48° N., including that upon which the pilgrims landed in the following December. Gorges regarded

these persons as intruders, and subsequently endeavored to oust them as well as the Massachusetts colony established under Winthrop at Charlestown and Boston. In 1621 the company transferred to William Alexander, afterward earl of Stirling, the country E. of the St. Croix (Nova Scotia), thus establishing the E. boundary of Maine as it now stands. Monhegan, the first or one of the first spots in Maine permanently peopled by Europeans, was settled in 1622, and Saco in 1623, or perhaps earlier. About 1629 the Plymouth company began to parcel out their territory in grants to suit applicants. In that year John Mason acquired the territory lying between the Merrimack and Piscataqua rivers, and called it New Hampshire, thereby settling the western boundary of Maine. In the course of 2 or 3 years the whole coast had thus been disposed of as far E. as the Penobscot. The country between the Penobscot and St. Croix, and even to the W. of the former river, was claimed by the French, and long remained a matter of dispute. In 1635 the Plymouth company, having resolved to give up its charter to the government, redi-vided the territory among its members, Gorges taking the whole region between the Piscataqua and the Kennebec, of which he subsequently (1639) received a formal charter from Charles I. under the title of the province of Maine. Several derivations are assigned for this name, the commonest opinion being that it was given in compliment to Queen Henrietta Maria of England, who it has been said owned the province of Maine in France. The province of Maine, however, then belonged to the crown of France, nor has it been ascertained that Henrietta Maria ever had any interest in it. Gorges was now appointed governor-general of New England with almost unlimited powers. (See GORGES.) His son Thomas was sent over as deputy in 1640, and established himself at Agamenticus, now York, where in 1642 arose a city called Gorgeana. On the death of Sir Ferdinando, Maine descended to his heirs. It was now really placed under 4 different jurisdictions: 1, that of Gorges, extending from the W. line to Kennebunk; 2, that of Rigby, from Kennebunk to the borders of the Kennebec valley, held under grant from Sir Ferdinando; 3, the Sagadahoc, from the Kennebec to the Penobscot; 4, the French (Acadia), from the Penobscot to the St. Croix. Massachusetts, apprehending lest these fragmentary and unsettled governments should fall into hands hostile to her interests, and stimulated by the wishes of many of the inhabitants, set up (1651) a claim under her charter to the province of Maine, and sent commissioners to admit the people of Gorges's and Rigby's grants into the jurisdiction of the Bay colony. The governments of Gorges and Rigby remonstrated, and carried the matter before the English parliament; but the Puritan party was now in the ascendancy at home, and the claims of the Puritan colony of Massachusetts were heard with more favor

than the protests of zealous adherents of the king and the established church. In 1653, 150 freemen in 5 other towns took the oath of allegiance to Massachusetts, which continued to exercise its authority in such a way as to prove that, however slight its claim to jurisdiction, the transfer was equally beneficial to both parties. The towns were governed in local matters nearly as they are now, and the rules of church discipline were less strict than in some other colonies, the people being generally favorable to religious freedom. No acts of persecution stain their history, and they frequently afforded an asylum to fugitives from intolerance in other parts. In 1658 Cromwell annulled the transfer of Acadia to France, which had been effected in 1622, and sent out Sir Thomas Temple as governor. He retained his post until 1669, when Acadia reverted to France in accordance with the treaty of Breda. In the mean time the Stuarts had been recalled to the throne of England, and the heirs of Gorges petitioned for the restoration of their territory in Maine. Royal commissioners were accordingly sent by Charles II. in 1664 to reestablish the authority of the grantees. Massachusetts resisted, and a conflict of jurisdictions ensued, which was terminated in 1677 by Massachusetts purchasing the interests of the claimants for £1,250 sterling. Two years before this the first Indian war in Maine was begun by King Philip, at whose instigation a series of unprovoked attacks were made upon the settlers, and over 100 white persons were massacred in the space of 3 months. Thenceforth the savages held the country in terror until 1760. Towns were plundered and burned; every twentieth settler was slain or carried into captivity, and many of them removed to more protected colonies. Meanwhile disputes were excited by the claims of the duke of York, who, under a grant from Charles II. of the Dutch territories in North America, professed to hold all that part of Maine lying between the Kennebec and St. Croix rivers. Sir Edmund Andros was commissioned as governor of the duke's territories in New York and Maine; but Massachusetts, having caused a new survey of the E. limit of her patent to be made, under which she pushed her boundary forward to the W. shore of Penobscot bay, continued to hold possession of all the colony except Sagadahoc and Pemaquid. When the duke came to the throne as James II., Andros was made governor of New England, and visited Maine, where he was guilty of great extortion. The Massachusetts charter had already been declared forfeit. The revolution of 1689, however, restored things to their former state, and thenceforth the history of the colony of Maine is merged in that of Massachusetts. From the close of Indian hostilities Maine began to make steady progress in civilization and wealth. The war of the revolution affected her but little, but during that of 1812 she was again exposed to the horrors of frontier struggles. The British obtained possession of a part of the

country, and kept it until the conclusion of peace. The final separation of Maine from her sister colony took place March 15, 1820, when she was admitted into the Union as an independent state. Ever since the treaty of 1783 a dispute existed between the governments of the United States and Great Britain as to the proper interpretation of that treaty so far as it related to the boundary between Maine and the British possessions. This controversy, which had at length created much excitement and ill feeling among the population in the neighborhood of the territory in dispute, and was endangering the peace between the two countries, was finally settled in a satisfactory manner by the treaty of Washington in 1842, by which Maine and the United States agreed to cede to Great Britain a small portion of the territory claimed by her, in return for the concession of Rouse's Point and the free navigation of the river St. John.

MAINE, an ancient province of France, and with Perche one of the great military governments of the kingdom, bounded N. by Normandy, E. by Perche and Orléannais, S. by Anjou and part of Touraine, and W. by Brittany. It is now included in the departments of Mayenne and Sarthe. Its capital was Le Mans.

MAINE-ET-LOIRE, a N. W. department of France, bounded N. by the departments of Mayenne and Sarthe, E. by Indre-et-Loire, S. E. by Vienne, S. by Deux-Sèvres, S. W. by La Vendée, and W. by Loire-Inférieure; area, 2,775 sq. m.; pop. in 1856, 524,887. It belongs to the basin of the Loire, by which it is annually inundated; the principal other rivers are the Maine, Loir, Sarthe, Mayenne, and Oudon. The surface is almost level, with slight undulations, and the soil very fertile, producing grain, wine, and fruits. Iron is found, and slate quarries are extensively worked. It has excellent breeds of cattle and horses; the forests abound in game, and the streams in fish. The principal manufactures are of linen, especially table linen and handkerchiefs, flannels, and cotton. It has a considerable trade in grain, wine, brandy, and cattle. Annual value of manufactured products \$5,466,080. Capital, Angers.

MAINE DE BIRAN, FRANÇOIS PIERRE GONTHIER, a French metaphysician, born at Grateloup, near Bergerac, department of Dordogne, Nov. 29, 1766, died July 16, 1824. He entered the body guard of Louis XVI., and was at Versailles during the tumults of Oct. 5 and 6, 1789, but escaped from the dangers of the revolution by retiring to his estate near Bergerac. There he began in solitude those philosophical reflections which have gained him the reputation of one of the most original and profound of French psychologists. In 1797 he was chosen to the council of 500, from which he was excluded on suspicion of royalism; in 1809 he became a member of the legislative body; and in 1813 he was one of the commission appointed to draw up an address to the emperor, which for the first time manifested a decided opposition to his policy. After the restoration he

was reelected to the chamber of deputies, became a councillor of state in 1816, and from 1818 retained his seat in the legislature, in which he constantly maintained the prerogatives of the crown. In a memoir entitled *Influence de l'habitude sur la faculté de penser*, which obtained the prize of the institute in 1803, he prepared for his departure from the reigning philosophy of Condillac by maintaining a distinction between active and passive mental habits, according to which the mind is active in perception and passive in mere sensation. As he grounded all the faculties upon the senses, this work was received with favor by the ideologists, and the author who was to lead the reaction of French thought against the sensational school thus began with a success obtained under its auspices. In his second memoir, *Sur la décomposition de la pensée* (1805), he abandoned the effort to give a physiological origin to thought, suggested that sensation could not furnish the active and motive element in man, and was disposed to admit a principle of intelligence distinct from the organism. This work was rapidly followed by others, the most important of which was the *Examen des leçons de M. de Laromiguière* (1817), in which he completely passes from sensational to spiritual philosophy, and develops his own system, which caused Royer-Collard to say of him: "He is the master of us all." His fundamental doctrine relates to the will, which he regards as a distinct motive force, a faculty raised above the others, constituting the person himself. He conceives of personality as a force, not as a substance, and maintains that the substitution of the idea of the latter for that of the former with respect to man and the universe has often led philosophy into pantheism, since force is the only principle of life and individuality. This individual force appears in union with an organic resistance, from which it is inseparable; and any system, therefore, which tends toward absolute unity contradicts the primitive conditions of our being. The processes of the mind are but manifestations of will, which furnishes the universal and necessary notions of causality, unity, and liberty. He applies his doctrine to nature, maintaining that every efficient cause in the order of the world is an immaterial force. All beings, he says, are forces, and all forces beings; nothing really exists except as a force, as a veritable living substance. Thus, he adds, profound and consistent thinkers have been led to spiritualize the world, as Leibnitz did; to admit no reality but that of simple beings, whose whole essence is active force. This result of his system appears especially in the article on Leibnitz which he furnished to the *Biographie universelle*, in which psychology passes into ontology, and the doctrine of monads or simple active principles is accepted as the law of the universe. The style of Maine de Biran is unsurpassed in obscurity and difficult involution by that of any French philosopher, and presents a striking contrast with the grace-

ful writings of his opponent Laromiguière. It is however pregnant with meaning, and Cousin styles him indisputably the most original of all his French masters. A complete edition of his works was edited by Cousin (4 vols., Paris, 1841).—See Naville, *Maine de Biran, sa vie et ses pensées* (Paris, 1857).

MAINTENON, FRANÇOISE D'AUBIGNÉ, marchioness, second wife of Louis XIV. of France, born at Niort, Nov. 27, 1635, died at St. Cyr, April 15, 1719. Her birthplace was a prison, Château-Trompette, where her father, Constant d'Aubigné, baron of Surimeau, was confined for having killed his first wife and her lover, whom he had taken in adultery. The mother of Françoise was the daughter of the governor of the prison, whom D'Aubigné had persuaded to marry him secretly. In 1639 he was discharged from prison, and with his wife and children emigrated to Martinique, where he died in the utmost poverty. His widow returned to France, whither she was soon followed by her daughter, who, after various vicissitudes and much suffering from poverty and ill treatment on the part of her relatives, found herself at the age of 15 in Paris, an inmate, in a dependent and almost menial position, of the house of her godmother, the countess de Neuillant, who had converted her from Calvinism to Catholicism. The comic poet Scarron, who was paralytic and a cripple, lived in the same street with the countess de Neuillant, became interested in the young, beautiful, and intelligent girl, whose adventures had been related to him, and furnished money to enable her to enter a convent, which poverty had hitherto prevented her from doing. Françoise called to thank her benefactor, and at their first interview he proposed to her to become his wife. After a week's deliberation she consented, and they were married in 1651. She was at this time exceedingly beautiful, graceful, and witty, and the house of Scarron soon became the resort of the most brilliant intellects of Paris. Scarron died Oct. 14, 1660, leaving his young widow nearly penniless, his pension ceasing at his death. Mme. Scarron remained at court petitioning for the reversion of her husband's pension with small hope of success, till Mme. de Montespan, the king's mistress, hearing of her destitution, interfered in her behalf, procured her an annual allowance of 2,000 francs, and somewhat later made her the governess of the children she had had by Louis, much to the dissatisfaction of the king, who at first did not like the extreme gravity and reserve of the young widow. Her talents and wisdom, however, soon attracted his attention, and she became his confidant and adviser, was made a marchioness, and took the name of Maintenon from an estate, and after having resolutely refused to become the king's mistress became his wife by a secret marriage in 1685 or 1686, at which time he was 48 and she 50 years of age. From this time till his death Louis was greatly under her influence, though her power over him was exercised with extreme prudence

and moderation. She carefully shunned the appearance of meddling with affairs of state, though in reality nothing was done without her knowledge and consent. It was at her instigation that the edict of Nantes was revoked and the Protestants persecuted. After the death of the king, in 1715, she retired to the convent and seminary of St. Cyr, which she had herself founded, where she spent the rest of her life in acts of charity and in devotional exercises, which from earliest youth she had been accustomed scrupulously to observe.—See *Madame de Maintenon peinte par elle-même* (Paris, 1820), which contains her letters, and *Histoire de Mme. de Maintenon*, by the duke de Noailles (2 vols. 8vo., Paris, 1848).

MAISTRE, JOSEPH, count de, an Italian statesman and author, born in Chambéry, April 1, 1753, died in Turin, Feb. 25, 1821. His father was president of the senate of Savoy. After having studied at the university of Turin, he entered the magistracy in 1775, and became a member of the senate in 1787. The invasion of Savoy by the French in 1798 obliged him to retire to Turin; and in 1798, when the king had to give up his possessions on the continent, De Maistre followed him to the island of Sardinia, where he was appointed grand chancellor. This office he retained until 1803, when he was sent as ambassador to St. Petersburg. He remained at the Russian court for 14 years, and wielded for some time a considerable influence over the czar Alexander. On his return to Turin (1817) he was appointed minister of state and regent of the grand chancery. He commenced his literary career with an *Éloge du roi Victor Amédée*. In a speech made at the opening of the senate in 1784 he remarked: "Our age has distinguished itself by a destructive spirit which has spared nothing, neither laws, customs, nor political institutions; it has attacked all, shaken all, and the devastation will extend to limits which no one can as yet foresee." The outbreak of the French revolution caused these words to appear prophetic, and increased the reputation of the author in the literary and religious world. He wrote several works against the revolutionary party in France, among which his *Considérations sur la France* (1794) had the greatest circulation. Notwithstanding the strictest prohibition, 3 editions of it appeared in Paris in one year. In 1810 he published at St. Petersburg an *Essai sur le principe général des constitutions politiques et des autres institutions humaines*, the object of which was to show that God is the immediate source of all authority upon earth, and every attack upon religion is a prelude to the destruction of social and political order. A translation of a work of Plutarch, *Sur les délais de la justice divine dans la punition des coupables*, with notes, appeared at Lyons in 1816. His most celebrated work is that *Du pape* (Lyons, 1819). It treats of the pope from four points of view, viz.: 1, in his relation to the Catholic church; 2, to tem-

poral sovereignties; 3, to the civilization and happiness of the nations; 4, to the schismatic churches. It is considered as one of the standard Catholic works in favor of the infallibility of the holy see, which it infers from the necessity of an infallible authority in the spiritual order. Infallibility in the spiritual order is declared as synonymous with sovereignty in the temporal order. From the same standpoint he attacked the Gallicans in the work *De l'église Gallicane dans son rapport avec le souverain pontife, pour servir de suite à l'ouvrage intitulé: Du Pape* (Lyons, 1822). Among his other works are: *Lettre d'un gentilhomme Russe sur l'inquisition Espagnole* (Paris, 1822), and the *Soirées de St. Pétersbourg, ou entretiens sur le gouvernement temporel de la providence* (2 vols., Paris, 1821), in which the justness of war and capital punishment is strongly advocated. In his posthumous *Traité de la philosophie de Bacon* (Paris, 1836) he depreciates the English philosopher, and disparages critical philosophy in general. A very lively discussion was called forth by the publication of another posthumous work, *Mémoires politiques et correspondance diplomatique de Joseph de Maistre, avec explications et commentaires historiques*, by Albert Blanc (Paris, 1858), many passages in which seemed not fully to agree with his other writings. But like his previous works, it showed him full of expectation of an entirely new political and social order of things, when all states of the world should be closely united, with the pope as president; an idea which has since been developed by a school of Catholic writers, and was even made use of, though for a very different purpose, by Gioberti in his work *Del primato d'Italia*.—XAVIER, count de, an Italian author, brother of the preceding, born in Chambéry, Savoy, in 1764, died in St. Petersburg, June 12, 1852. In early life he entered the military service of Sardinia, but upon the conquest of the country by the French he emigrated to Russia, supported himself for some time by his pencil, and entering the Russian military service participated in the war against Persia, in which he attained the rank of major-general. He subsequently established himself in St. Petersburg, and devoted the remainder of his life to literary and scientific pursuits. In 1794, being then known as a chemist and as a landscape painter, he produced an ingenious philosophical trifle, entitled *Voyage autour de ma chambre*, which had great popularity, and of which numerous imitations of various degrees of merit subsequently appeared. In 1811 appeared his *Lépreux de la vallée d'Aoste* (translated into English, Philadelphia, 1825), a work founded on fact, and not less creditable to the author's literary capacity than to his humanity. It was followed by the *Prisonnier du Caucase*, and *Pras-covia, ou la jeune Sibérienne* (translated into English, Philadelphia, 1826), both containing vivid and truthful pictures of scenery and manners in the eastern and southern provinces of the Russian empire. A complete edition of his

works was published in Paris in 1825, in 3 vols. 18mo.

MAITLAND, SIR RICHARD, a Scottish lawyer and poet, born in 1496, died March 20, 1586. He held for a time the office of lord privy seal, and was the author of a "History and Chronicle of the House of Seaton," and of several poems, the most important of which is that on "The Creation and Paradyce Lost." A complete edition of his poems was first published by the Maitland club in 1830. He is celebrated as a collector of ancient Scottish poetry. His collections are yet extant in manuscript in the Pepysian library, Cambridge, and fill 2 large volumes.

MAIZE, or INDIAN CORN, a valuable grain, a native, according to De Candolle and the most eminent botanists, of South America. It belongs to the natural order *graminea*, and is a monœcious grass. Linnæus adopted the word as the specific name of his genus *zea* (Gr. *ζωω*, to live; i. e., affording sustenance to animals), and its scientific nomenclature is *zea mays*. Bonafous, however, after some previous writers, in his *Histoire naturelle, agricole et économique du maïs* (Paris and Turin, 1838), attributes to it an eastern origin, in accordance with an old idea entertained respecting many other tropical American vegetables. There can be little doubt that this is entirely erroneous; and neither any antique works of sculpture, nor any mention in ancient writers, have been found, where it is represented as a cereal grain. Climate and long cultivation seem to have had such effects that the most marked variations have arisen, which have been considered distinct species. Stendel mentions as many as 7, though he is willing to allow that they may be varieties of one common species. A singular form, in which each seed or kernel is wrapped in a chaffy husk, is considered by A. de St. Hilaire as the primitive type; and this sort is said to grow spontaneously in the moist forests of Paraguay. It appears to have been known to Bonafous, and may be his *Z. cryptosperma*, made specifically distinct from *Z. mays*; but there is an impression that after 2 or 3 years' cultivation the chaffy glumes disappear and the kernels become bare as in ordinary maize. If this condition is effected by a gradual change of climate, thus seemingly fitting the plant for a more humid atmosphere, it cannot be considered the typical form. Kernels of maize taken from the mounds in Peru are in form like those of the variety called gourd-seed corn, thus seeming to indicate that the southern variety, with thin, elongated, and flattened seeds, approximates more nearly to the original character than do the northern field sorts, which are blunter and shorter. It is likewise claimed that Columbus found the maize in cultivation when he first landed at Cuba; and the early visitors from Europe witnessed its cultivation in other parts of America. In 1608 the colonists at James river successfully raised large crops of maize, imitating with little variations the culture practised there by the aborigines. In 1621 the pilgrims at Plymouth found this grain

the field vegetable of the Indian tribes, and extensively raised by them for food. This remarkable inclination to accommodate itself to circumstances of climate, by producing distinct varieties, renders the maize a most valuable agricultural plant. Some of the larger varieties assume the habit and port of the tallest growing annuals; while, on the other extreme, there are sorts of the dwarfiest proportions, scarcely exceeding the size of some of the common grasses. A few years ago the so called tree corn was brought from China, of extraordinary height in growth; and the well known Canada corn, which matures in a few weeks' time, and which is about 2 feet in height, may be cited for the opposite illustration. The early Mandan corn (*Z. m.*, var. *præcox*, Nuttall) has a very low stem, and is successfully cultivated by the aborigines on the Missouri to its sources, ripening in a climate where no other variety could exist. An early ripening variety is known as the quarantain or 40 days maize, originating in Hungary and introduced into England from France. The geographical area which is favorable to maize is in America from lat. 40° S. to 54° N.; and in the eastern hemisphere it extends from the Azores to the southern part of Europe, being raised to a certain extent even in Asia Minor, Egypt, Hindostan, and China; so that, with the exception of rice, it is perhaps the most widely cultivated grain in the world. In the warmest parts of the torrid zone, 3 crops can be secured in a season; and in the colder portions of its range, 2 or 3 months are allowed for the maturation of its seed. The variety known as Canada corn is of this character, and is one of the most important to the farmer; 75 bushels of it to the acre have been raised upon the exposed promontory of Nahant, Mass. The kinds of field corn most valued in New England are the large yellow, of which a superior variety is the King Philip, and the red, which is only a colored variety of the former. The sweet corn is principally grown for the table, and its green stalks are used for feeding cattle. The Tuscarora, abounding in starch grains, and some other early white-kernelled sorts, are likewise planted to supply the table with boiled ears; but the most delicious are the wrinkled kernelled sweet corns. Some very excellent hybrid forms have been produced by using the southern farinaceous varieties as the parent stock for impregnation with the pollen of the sweet corn. The white gourd-seed corn is recommended for hominy and cakes, and the golden yellow gourd-seed as best adapted to southern and western cultivation.—There are the greatest differences in the proportions of farinaceous and other matters in the different varieties. It would seem as if the amylaceous kinds were intended for more southern latitudes, and the sorts abounding in oil better suited to northern aspects. The most starch is found in the Tuscarora. The rice or pop corn abounds in oil. This oily principle is easily seen in the form of fixed oil dots lodged in the cellular tissue of the seed, by taking a thin longitudinal

section and submitting it to a high magnifying power; by touching the slide on which the section lies with a solution of iodine, the starch will be colored violet, while the oily parts will remain uncolored. It is this closer and albuminous-oily structure in some kinds of maize which renders the kernel so compact and hard, and which on bursting with heat causes the popping or inversion of the contents of the grain, which cannot be effected in the farinaceous kinds. These harder seeded varieties are sometimes called flint corn, and are unfit for dry feed; but the sweetest and longest keeping meal is procured from them. Abundance of illuminating oil is also extracted from such corn. The amount of nutritive matter afforded by maize is said to be inferior only to wheat and rice. The preponderant amount of the phosphates in some particular varieties renders them valuable for fattening cattle, swine, and poultry, though perhaps too exciting for human food. The flint corn, on the contrary, is better suited for the latter purpose, and does not exhaust the soil nearly as much. All the sorts of Indian corn require however light, rich, stimulating soils; and hot weather and frequent showers are favorable to its growth. Droughts, unless too long continued, affect it less than might be expected; and it has been often noticed that showers falling after weather so hot and dry as to curl the leaves, will restore them to verdure and vigor.—The contour of a full-grown maize plant is beautiful, and partakes of the style of tropical vegetation. In well tilled lands, the foliage is large, the leaves are numerous and dark green, the internodes of the stems clean and bright, and the joints defined and prominent. Numerous aerial roots tinted with various colors project from the lower parts of the stem, which, if undisturbed, find their way into the surface soil, and serve as supports or cables to sustain the growing stalks. Hence the latest mode of raising Indian corn is to avoid hilling or drawing the earth into conical heaps about the stems; on the other hand, care is taken merely to keep the soil well hoed, loose, and free from weeds. The disposition to avail itself of food is seen in scarcely any other field crop to so remarkable a degree as in the Indian corn; and highly stimulating manures render apparent their service throughout the season. Certain kinds of seaweeds, as kelp, have also been found serviceable; but they should be spread evenly over the ground and then ploughed in.—See an "Essay on the History and Importance of Indian Corn as an Agricultural Product," by C. L. Flint, in the "Transactions of the Essex Agricultural Society" for 1846. Valuable statistical tables of the corn crop in the United States can be found in the patent office reports for 1853 ("Agriculture," p. 101); and many historical items of much interest are embodied in a paper in the "Transactions of the Illinois State Agricultural Society" for 1856-'7.

MAJESTY, a title of the highest honor, first used by the Romans to designate the supreme

power and dignity of the people (*majestas populi Romani*), as well as of its highest chosen representatives or rulers, as dictators, consuls, and the senate. On the overthrow of the republic, the emperors assumed the same title (*majestas Augusti*), and after them it was adopted by the emperors of the West. Of kings, Louis XI. of France and Henry VIII. of England assumed it first. It is now generally bestowed on all emperors and kings of Europe, except the sultan, who is styled highness, as well as on the emperor of Brazil. The official title of the emperor of Austria is imperial royal majesty. He has also, as king of Hungary, the title of apostolic majesty, which was bestowed on St. Stephen, the first Hungarian king, by Pope Sylvester II. (1000). At a later period the titles of Catholic majesty, most Christian majesty, and most faithful majesty were bestowed by the see of Rome on the kings of Spain and France respectively. Sebastian III. of Portugal first received it from Philip II. of Spain. Violations of the majesty of the people, as for instance treason, were termed by the Romans *crimina læsæ majestatis*, a term also used of violations of monarchical dignity.

MAJOR, in music, a term applied to imperfect concords, but chiefly to the interval of the third. It also denotes that one of the 2 modern modes in which the third is 4 semitones above the tonic or key note.—In military science, the major is a field officer ranking next below a lieutenant-colonel and above a captain. He has generally the command of a battalion, the exercises of which he superintends, and in action or on parade carries into effect the orders of his superior officer. In the U. S. service each regiment of artillery, cavalry, and infantry has 2 majors; those of engineers and topographical engineers have 8 each. In the military services of European countries the number of majors in a regiment is regulated by that of the battalions. The term does not occur however in the artillery or engineers in the British army, and in the French service it has been superseded by that of *chef de bataillon*. This class of field officers does not appear to have existed before the 17th century. A brigade major is an officer who performs for a brigade, or in garrison, the duties ordinarily discharged by a major in a regiment or battalion. A major-general ranks next below a lieutenant-general, and is the highest grade in the United States army, that of lieutenant-general, which has been conferred in two instances only, being of an exceptional character. In the British service the major-general is the lowest general officer. In other cases, the term major, when applied as an epithet to the several denominations of men in an army, signifies the superior of the department; as sergeant major, the chief non-commissioned officer in a regiment, who assists the adjutant; drum major, the chief of the drum corps, &c.

MAJORCA (Sp. *Mallorca*), the largest of the Balearic islands, in the Mediterranean, belonging to Spain, situated about 120 m. S. from

Barcelona, between lat. $39^{\circ} 20'$ and $39^{\circ} 57'$ N., and long. $2^{\circ} 20'$ and $8^{\circ} 30'$ E.; length from E. to W. nearly 60 m.; breadth in some parts 40 m.; area, 1,400 sq. m.; pop. in 1857 about 200,000. The northern half of the island is covered by mountains, the highest of which is 5,114 feet above the sea. The southern half is comparatively level. The rocks are generally of secondary or tertiary formation. There are only two rivers, both of them small, and there is a general want of water. The climate is temperate, the thermometer in summer ranging only from 84° to 88° , while that of winter seldom falls below 48° . The island produces marbles of great beauty and variety, and also slate and plaster. Lavender, rosemary, thyme, marjoram, marsh mallow, jonquil, and wild celery are the commonest vegetable productions. Mules abound, and are the only beasts of burden and of draught. The sheep are large, and produce great quantities of fine wool. Game of the smaller kind, such as hares, rabbits, quails, and partridges, is very plentiful. There are scarcely any venomous animals. The soil is exceedingly fertile, and though the agricultural skill of the islanders is imperfect, the annual product is estimated at \$3,000,000. The olive crop yields yearly 650,000 gallons of oil. The people manufacture a considerable quantity of woollen stuffs, not only for their own use, but for export to Spain, Malta, Sardinia, and America. They derive a large profit from inlaid work, which they make with much skill. Their wines are excellent, and are largely exported. The island contains two cities, Palma and Alcercia, and many villages. Palma is the capital and the seat of a bishop. The natives resemble the Spaniards, and particularly the Catalans, in their appearance and manners. The upper classes speak Castilian, but the lower orders use a dialect which is a mixture of Greek, Latin, Arabic, Catalanian, Languedocian, and Vandal words. The people make excellent soldiers and sailors, and are remarkably honest and hospitable. (See BALEARIC ISLANDS.)

MALABAR, a province of British India, in the presidency of Madras, on the W. coast of Hindostan, between lat. $12^{\circ} 2'$ and $10^{\circ} 33'$ N.; area, 6,000 sq. m.; pop. in 1854, 1,514,909. It is bounded N. by the province of Canara, S. by the semi-independent territory of the rajah of Cochin, W. by the Indian ocean, and E. by the chain of the Western Ghats, varying from 4,000 to 7,000 feet in height, between which and the sea the country lies, extending about 150 m. along the coast, with an average breadth of 40 m. With trifling exceptions, a low sandy strip, from 1 to 8 m. broad, runs along the shore, and is covered with a continuous and luxuriant grove of cocoanut trees, to the cultivation and care of which the natives give the greatest attention. Behind this tract, hills of inconsiderable height come down from the mountain chain which forms the E. boundary. Between these hills there are valleys of extreme fertility, being the

receptacles of the soil washed in the course of ages by the heavy rains of this region from the surrounding eminences. The hills have level, or rather perfectly horizontal summits of naked rock, which is here a peculiar characteristic of the face of the country. Many of them have steep sides, which are not unfrequently formed into terraces and cultivated. All the country that borders on the Ghats is covered with forests and dense jungle, belts and detached portions of which in places stretch to within a few miles of the sea. Malabar is watered by innumerable streams, but all of them have necessarily very short courses. The chief river is the Beypoor, which has 9 feet water on the bar, and is with its tributaries navigable for boats of considerable size for about 30 m. inland; next to this is the Ponany river, which has a longer course, but much less depth of water. Several inlets of the sea run along a short distance from the shore parallel to the coast, receive the mountain streams, and communicate with the ocean by shallow channels, and are navigable for small boats for nearly the whole length of the province. It is on the banks of the rivers and of these inlets, in the valleys, and along the coast, that the inhabitants reside. The climate is, on the whole, healthful, though in the interior jungle fever is prevalent at certain seasons of the year. The hot season is from February to May, the wet from May to October, and the cool during the remainder of the year. The thermometer seldom rises above 90° in the shade, and rarely falls below 70° . During the wet season very heavy rain falls along the coast, increasing toward the interior; and at Wallaghant on the face of the Neilgherries, about 2,500 feet above the sea level, 821 inches were registered in one year.—The principal vegetable productions are pepper, coconuts, ginger, coffee, hemp, cardamoms, betel nuts, turmeric, arrow root, sapan wood, sandal wood, timber of different sorts, and various gums and resins. Teak and 120 other kinds of valuable timber have been enumerated in a report upon the forests of Malabar. Cardamoms are produced from the forest land on the face of the mountains which bound the province, at the height of from 2,000 to 4,000 feet above the sea. From certain indications those who follow the business know where to fell the timber, which they afterward burn, and the following year a crop of cardamoms springs up spontaneously. Pepper is chiefly cultivated in the northern part of Malabar, in the neighborhood of Telicherry. The trailing plant from which it is produced requires but slight care, the cultivator having little more to do than collect the produce. It is only of late years that coffee has been grown to any considerable extent in this district, and the cultivation is entirely the result of the enterprise of British planters. The estates are situated on the slopes of the mountains, some 2,000 feet above the sea, where the land is of little value to the natives, and where the malaria which causes jama-

gle fever lower down does not ascend. Ground is easily acquired, either from the government or native land owners; the capital embarked is small, and as the rate of wages for laborers is only from 6 to 10 cents a day, the profits derived by the proprietors of coffee estates are proportionally large. Rice is grown throughout the province, but not in sufficient quantities for internal consumption. The cultivation of ginger, since it has been exported to Europe, has been carried on with great vigor. Rich iron ore is found in many places, and gold in small quantities; there is no limestone in Malabar. Large herds of elephants and bison frequent the interior forests. There are some tigers and numerous species of the leopard, deer of various kinds, elk, bears, hogs, porcupines, squirrels, apes, and monkeys. In the most secluded recesses of the mountains there is said to be a creature of the ox kind, called the *gayal*, 10 feet high and large in proportion, with beautiful horns and a hide of a silver gray color. There are small bullocks, which, together with buffaloes, are used in tilling the ground; there are but few horses, and traffic is either carried on by water or upon men's shoulders, as in China.—The population of Malabar is made up of Hindoos, Mohammedans, and Christians. As in the other parts of India, the highest class of Hindoos are the Brahmins, who are here called Namburis, and who to limit the numbers of their race prevent the younger sons from marrying. There is another cast of Brahmins called Puttar, who are much more numerous than the Namburis. The next in rank are the Nairs, who are of 11 castes, of various ranks and professions, but all pretend to be born soldiers. Their habits and manners are marked by some strange peculiarities, among which may be mentioned the want of that puerile disposition natural to other Hindoos, and their utter disuse of marriage. A girl on reaching the age of puberty forms any connection she thinks fit; and the children, who have no claim upon their natural father, become the heirs of her brothers. The Tiars, or Theans, are considered next in rank to the Nairs, and are engaged in various occupations, but principally in cultivating the ground. The Poliers, or Obermars, are a numerous class, who, before the British interfered in their behalf, were held in slavery, and bought and sold separately or along with the land. The Niadis are the lowest specimens of all, and are outcasts considered so impure that even a Ohermar would be defiled by their touch. They wander about in companies of 10 or 12, keeping at a little distance from the roads, and upon seeing a traveller set up a cry for assistance. They refuse all labor, subsist upon roots and any food however loathsome, and live in wretched huts built in secluded spots. The Ohermars and Niadis are supposed to be the descendants of the aboriginal inhabitants of the country, and are much smaller in stature and darker in complexion than the Brahmins, Nairs, or Tiars, who are all of good height and well formed, with remarkably hand-

some features and olive-colored complexion. The native Mussulmans, denominated Mapilas, form about one fourth of the population. They are descended from Hindoo mothers by Arab fathers, who settled in Malabar about the 7th or 8th century, and are exceedingly fanatical and treacherous. There are some Syrian Christians toward the S. boundary of the province, who consider themselves descendants of converts made by the apostle St. Thomas in the 1st century (see CHRISTIANS OF ST. THOMAS); and also a few thousand converts to Christianity and descendants of the Portuguese, who reside chiefly in the neighborhood of their ancient settlements.—The Hindoo population of Malabar are not prone to congregate in towns and villages, but for the most part live in separate houses, neatly built and kept scrupulously clean, throughout the country. The towns owe their origin entirely to foreign settlers, and the chief are Calicut, Palghat, Tellicherry, Cannore, and Ponany. At Beypoor, 7 m. S. of Calicut, where the river of the same name falls into the sea, is the terminus of a railway now in course of construction, connecting Madras with the coast of Malabar. There are also extensive iron works erected here by an English joint stock company, with a capital of £400,000; but though they have been in operation for 14 years, their production has been exceedingly limited, and their eventual success is very questionable. Many ships have been built at Beypoor, for the construction of which the forests situated on the banks of the river supply teak timber of a darker color and better description than is found elsewhere, and of very large size. There is also a manufactory at this place where both hemp and cotton canvas is made, but the quality is not very good. It was at Beypoor, and not at Calicut as generally supposed, that the first European navigator touched. The exports of Malabar amount in value to about \$8,000,000 per annum, and have been largely increased of late years. They consist chiefly of cocoanuts and coconut oil, coir rope, pepper, ginger, cardamoms, camphor, coffee, kino, and various gums and resins. The imports do not amount to more than one third of the value of the exports.—It is supposed that Malabar was conquered in very early times by a king from the opposite side of the mountains, and that the Nairs came at the same time as a military body. They took every opportunity to aggrandize themselves, and continued to rule the country till Hyder Ali invaded it in 1760. No land tax was levied in Malabar till this event. Hyder subdued the country, and expelled all the rajahs except such as conciliated him by immediate submission. In 1788 his son Tippoo proposed to the Hindoos to embrace the Mohammedan faith, and followed up his proposition by levying large contributions on his infidel subjects, and forcibly circumcising many of the Brahmins, Nairs, and others. On the breaking out of the war between Tippoo and the British in 1790, the refractory Nairs, many of whom had

fled to the forests to escape his bigoted persecution, joined the latter and succeeded in driving him from the country. With some slight disturbances, Malabar has since remained a portion of British India. During this period the population has doubled, and the country is steadily advancing.

MALABAR COAST, an indefinite term applied to the whole W. side of the Indian peninsula. In a somewhat more restricted sense it means the coasts of Concan, Canara, Malabar proper, Cochin, and Travancore.

MALACCA, a British territory and settlement, situated on the W. side of the Malay peninsula, between lat. 2° and $2^{\circ} 29' N.$, extending about 48 m. along the coast, and varying in breadth inland from 10 to 28 m.; area, 1,000 sq. m.; pop. in 1858, 67,142, composed of the following races: 2,112 Europeans and half breeds, 49,800 Malays, 8,540 Chinese, 1,850 Portuguese, 3,750 Hindoos, 360 Arabs, and 1,230 military and convicts. The territory lies in an irregular triangle, the S. boundary or base of which is formed by the Cassang river, which rises near a remarkable conical hill named Mount Ophir. In the interior the country is arranged in a series of undulating hills and valleys, generally lying parallel to the sea coast. There are no great ranges of hills, but a large number of detached elevations are found, varying in height from 100 to 1,000 feet. Mount Ophir, called by the natives Ledang, is the only considerable elevation; it rises to the height of 4,820 feet above the level of the sea. The general formation of these hills and of the territory is granitic, covered with laterite, or red clay ironstone. The coast line may be divided into 3 portions of distinct character. The W. portion, from Lingie river to Tanjong Kling, 17 m., shows a bold wooded elevation reaching to the sea. Behind this coast plateau the series of hill and valley commences immediately. The central portion, or from Tanjong Kling to the town of Malacca, 5 m., is a sandy beach, with ferruginous rocks, appearing in points jutting into the sea, through a sandy beach. The third part, 21 m., is a mud flat, exposed for a great distance at low water; and the inner portion is covered with mangrove jungle. Inland from the two latter portions, an immense alluvial plain, with detached hills, extends considerably beyond the inner boundary of the territory. The country is watered by 4 navigable rivers, the Lingie, Malacca, Duyong, and Cassang. The Lingie is navigable for vessels of 200 tons as far as Simpang, a distance of 8 m.; while the other rivers can accommodate large cargo boats for nearly the same distance, beyond which canoes are used. Numerous smaller streams fall into the sea. The soil of the low lands is a rich alluvium, varying in color from light brown to red. Round the bases and on the sides of the elevations, rich deposits are formed from the detrition of granite. The territory is said to be capable of producing in perfection almost every article of in-

tertropical culture; but little has been done to develop its resources, and it has never furnished enough grain for the support of its inhabitants. It enjoys the equable temperature and salubrious climate of the Malay archipelago, to which it geologically and ethnologically belongs. The greatest recorded range of the thermometer is from 68° to 86° .—According to official statements, the increase of the native population is greatly checked by the ravages of tigers. Other ferocious animals, as the leopard and black panther, abound. There are 9 species of the monkey tribe. Among the other animals are the elephant, rhinoceros, buffalo, wild ox, tapir, several species of deer, the antelope, and musk deer. The chief crops are rice, black pepper, the cocoa palm, and coffee. Nutmeg plants have been brought from the Moluccas, and cultivated with success. Cinnamon, of superior quality to that of Ceylon, is cultivated for exportation. The chief export is tin, which is found in the alluvial plains in great abundance; it is somewhat inferior in quality to the tin of Banca and other islands S. of the peninsula, and is known in commerce as "straits tin." The yield of the tin mines of the territory in 1856 was about 1,200 tons; but since then, up to 1859, there has been a gradual diminution of product, owing to the exhaustion of the surface ores. In 1854 there were about 8,000 Chinese coolies engaged in these mines; and in 1858 not more than 1,800 were occupied in the tin stream works of the territory. Gold is washed from the sands of all the streams, in fine dust, and about 8,500 ounces are now obtained annually. The trade is chiefly with the neighboring British settlements, Penang and Singapore. The exports in 1858 amounted to 2,818,462 rupees, or a little over \$1,000,000.—In 1851 the government of this province was detached from that of Bengal, and constituted a separate presidency, which includes Singapore, Penang, and this territory. The chief magistrate is styled resident councillor, who is subordinate to the governor of the settlements residing at Singapore.—**MALACCA**, a city and the capital of the preceding territory, is situated in lat. $2^{\circ} 14' N.$, long. $102^{\circ} 12' E.$, 45 m. from the opposite coast of Sumatra; pop. about 30,000. It was the chief emporium of oriental commerce before Europeans visited the Indian seas. The Arabs, Persians, and Hindoos resorted to its port to procure the spices, gums, and other precious products of the Malay archipelago, which they afterward distributed throughout Asia, Africa, and Europe. It owes its commercial distinction to the freedom of its roadstead from hurricanes, or the influence of the monsoons, and to its advantageous situation in the straits of Malacca, the great highway of eastern commerce. When first visited by the Portuguese in 1508, it contained about 85,000 dwellings, and, according to the lowest computation made at the time, 150,000 inhabitants. It was besieged and taken by Albuquerque in 1511. The victor captured upward of 8,000 pieces of brass and iron cannon,

mounted upon the walls of the city, which were said to be superior to any of Portuguese fabrication of that period. The Portuguese held possession of the city for 130 years, and during that period it underwent 19 sieges, 8 of which were undertaken by the Malays, chiefly of the state of Acheen, and the rest by the Dutch, who captured the place after 9 months' siege and blockade in 1641. The Dutch held the city for 154 years, when they surrendered to a British besieging force in 1795. In 1818 it was restored to the Dutch government; but it again reverted to the British in 1824, in exchange for Bencoolen in Sumatra. There are many notable ruins of fortifications constructed by the ancient Malay kings, and many of their tombs; also ruins of monasteries, churches, and fortifications constructed by Albuquerque, including those of the monastery of Madre de Dios, on a hill in the rear of the town, which contained the body of St. Francis Xavier. The Jesuits were in 1859 building a splendid cathedral, and are making extraordinary missionary exertions to convert the natives in the city and territory, and throughout the Malay peninsula.

MALACCA, STRAITS OF, the waters which separate the Malay peninsula from the island of Sumatra. This channel is the most frequented route of European vessels proceeding eastward to Chinese and neighboring points; and it is also in the line of Australian and Malaysian communication with continental India. It enjoys with the Malaysian seas an entire exemption from the hurricanes and typhoons which prevail in the neighboring waters to the eastward and westward. Two lighthouses constructed by the British government, at the N. W. and S. E. extremities, contribute greatly to the safety of its navigation. The channel is about 500 m. long, and from 40 to 800 m. wide.

MALACHI, one of the minor prophets. The name may be defined either "my messenger," or "messenger of Jehovah." Nothing is known of his person or history, and many interpreters, as Umbreit, Hengstenberg, and others, are of opinion that Malachi is not a proper name, but a general title, and that Ezra was the author of this book. From the contents of the prophecy it may be inferred that the prophet lived after Zechariah, since in his time the second temple was already built (iii. 10), and that he was contemporary with Nehemiah (446 B. C.). The prophet reminds Israel of the kindness of God toward them in the past, and complains of the irreligiousness of the priests and the people (chap. i. and ii.). He then announces the coming of a messenger sent by the Lord to prepare the way for him, and the coming of the Lord himself to judgment, which will be (chap. iv.) condemnation of the wicked and a blessing on the good. The prophecy of Malachi occupies the last place in the canon of the Old Testament, and is referred to in several places of the New Testament. The best commentaries are those of Chytræus (1568), Sal. van Till (1700), Venema

(1759), Hitzig (1838; 2d ed., 1852), Maurer (1841), Ewald (1841), Umbreit (1846), Schegg (1854), and Reinke (1856). The last two are Roman Catholic scholars.

MALACHITE, an ore of copper, the green carbonate. (For its properties and uses, see COPPER.) A famous mass of malachite, found on the property of the Messrs. Demidoff in the Ural mountains, must have weighed, after allowing for cavities and inequalities, 8,000 poods (108,000 lbs.). Its texture was of large and small kidney-shaped nodules; color from a deep green in some varieties to a fine turquoise tint in others. When polished, it exhibited the most beautiful markings. The geological formation in which it occurred was argillaceous schist; and the immediate bed which contained it was of an ologistic manganiferous iron in a state of decomposition.

MALACOLOGY (*μαλακος*, soft, and *λογος*, discourse), that department of zoology which treats of the *mollusca*, some of which were termed even by Aristotle *malakia* (soft animals), including the examination both of the external shells and the internal organs. In the article CONOLOGY the outer shells of mollusks have been sufficiently described, and their internal organization and habits will be noticed under MOLLUSCA; it only remains here to enumerate briefly some of the principal systems of classification. Linnæus (1766) placed mollusks in his 6th and lowest class of *vermes*, with worms and zoophytes. Humphrey (1797) classified mollusks entirely by the shells, dividing his class *testacea* into the orders: I., marine, and II., fluviatile, each with the divisions of univalves and bivalves, the first having also its multivalves (pholas, barnacles, &c.), and III., terrestrial shells.—As early as 1812 Ouvier had given to the world his views on the classification of animals, founded principally upon his researches in comparative anatomy; he makes the mollusca his 2d branch, with the classes; 1, *cephalopoda* (like cuttle fishes); 2, *pteropoda* (like *clio* or whale bait); 3, *gasteropoda*, with orders *pulmonata* (slugs and snails), *nudi-branchia* (naked marine genera without shells, like *doris*), *inferobranchia* (*phyllidia*), *tectibranchia* (*bullæ* and *aplysia*), *heteropoda* (*carinaria*), *pectinibranchia* (most of the marine univalves, *turbo*, *trochus*, &c.), *tubulibranchia* (like *siliquaria*), *scutibranchia* (*haliotis*, &c.), and *cyclobranchia* (*patella* and *chiton*); 4, *acephala*, with orders *testacea* (oyster, clam, and most bivalve shells) and *tunicata* (ascidians); 5, *brachiopoda*, like *terebratula*, *crania*, and *lingula*; and 6, *cirrhopoda* (like barnacles), now placed among *articulata* in the class *crustacea*.—De Lamarck (1815-'22) arranged the mollusks in 2 classes: one his 11th, *conchifera* or bivalves, with the orders *dimyaria* (having 2 separated muscular impressions on the inside of the shells), and *monomyaria* (with a nearly central single impression); the other his 12th class, *mollusca*, with the orders *pteropoda*, *gasteropoda*, *trachelipoda* (*helix*, &c.), *cephalopoda*, and *heteropoda* (*carinaria*); he placed the ascidians in his 4th

class, *tunicata*, among his apathetic animals; he made of the cirripeds his 10th class, with the orders *sessilia* and *pedunculata*, ranking them and the next two classes among sensitive animals.—De Blainville (1822), in his 4th type or *malakoscopia* (*mollusca*), makes the classes: 16, *cephalophora*, with the divisions *diocia* (cephalopods and most gasteropods) and *hermaphrodita* and *monoica* (the remaining gasteropods), and 17, *acephalophora*, with divisions *palliobranchia* (brachiopods), *lamellibranchia* (*acephala*), and *heterobranchia* (ascidians); he makes improperly a distinct type for the cirripeds and chitons, the former being crustaceans, and the latter gasteropods (though forming his class 15, or *polyplaxiphora*, in the 8d type of *malakoscopia*).—Ehrenberg (1836), in his division of *ganglioneura* (with ganglionic nervous system), and subdivision *sphygmooza* (with a heart and pulsating vessels), makes his 4th section of *mollusca*, characterized by absence of articulations to the body and by the irregular dispersion of the nervous ganglia; he gives the classes *cephalopoda*, *pteropoda*, *gasteropoda*, *acephala*, *brachiopoda*, *tunicata* (simple ascidians), and *aggregata* (compound ascidians); the cirripeds he places among crustaceans.—Burmeister (1843), in his 8d type or symmetrical animals, makes his 4th sub-type the 4th class or *mollusca*, with the orders *perigymna* (*tunicata*), *cormopoda* (*acephala*), *brachiopoda*, *cephalophora* (pteropods and gasteropods), and *cephalopoda*; cirripeds he places among crustaceans.—Owen (1848-'58), in his "Lectures on Comparative Anatomy," and article "Mollusca" in the "Encyclopædia Britannica" (8th edition), divides the province *mollusca* or *heterogangliata* into 2 sections, *acephala* and *encephala*, according to the absence or presence of a head and its accompanying parts. I. *Acephala*, with the classes: 1, *tunicata*, with orders *saccobranchiata*, *dactylobranchiata*, and *taniobranchiata*; 2, *brachiopoda*, with orders *anthropomata* and *lyopomata*; 3, *lamellibranchiata*, with the groups *monomyaria* and *dimyaria*, with one or two adductor muscles. II. *Encephala*, with the classes: 4, *pteropoda*, with orders *thecosomata* and *gymnosomata*; 5, *gasteropoda*, with the divisions: A, *monæcia*, with orders *apneusta*, *nudibranchiata*, *inferobranchiata*, *lectibranchiata*, and *pulmonata*, and B, *diæcia*, with orders *heteropoda* (*nucleobranchiata*), *tubulibranchiata*, *cyclobranchiata*, *scutibranchiata*, and *pectinibranchiata*; and 6, *cephalopoda*, with orders *tetrabranchiata* and *dibranchiata*. The cirripeds he places among articulates, though in a class distinct from crustaceans, and he, with his predecessors, retains the *bryozoa* among radiates.—Straus-Durckheim (1848) divides mollusks into 5 classes: 1, *céphalopodes*, with the orders *polythalamæ* and *cryptobranchæ*; 2, *ptéropodes*; 3, *gastéropodes*, with orders *hétérobranches*, *nudibranches*, *inferobranches*, *lectibranches*, *pulmonés*, *pectinibranches*, *tubulibranches*, *scutibranches*, and *cyclobranches*; 4, *acéphales*, with orders *ostracodermes* and *tuni-*

ciers; and 5, *brachiopodes*.—Siebold (1845) makes 8 classes, as follows: 1, *acephala*, with orders *tunicata*, *brachiopoda*, and *lamellibranchia* (with sub-orders *monomya*, *dimya*, and *inclusa*); 2, *cephalophora*, with orders *pteropoda*, *heteropoda*, and *gasteropoda* (with sub-orders *apneusta*, *heterobranchia*, *tubicola*, *pectinibranchia*, and *pulmonata*); and 3, *cephalopoda*, without orders, but with families *nautilina*, *octopoda*, and *loligina*. (See Burnett's translation, Boston, 1854).—Leuckart (1848) divides mollusca into 4 classes: 1, *tunicata*, with orders *ascidia* and *salpa* (he is inclined to make these not simply a class, but a type intermediate between echinoderms and worms); 2, *acephala*, with orders *lamellibranchiata* and *brachiopoda*; 3, *gasteropoda*, with orders *heterobranchia*, *dermatobranchia*, *heteropoda*, *stenobranchia*, *pulmonata*, and *cyclobranchia*; and 4, *cephalopoda*.—Van der Hoeven (1846-'55) makes 8 classes: 1, *tunicata*, with orders *thaliacea* (*salpa*) and *tethyonidea* (ascidians); 2, *conchifera* (bivalves), with orders *palliobranchiata* (brachiopods) and *lamellibranchiata*; and 3, *mollusca*, with orders *pteropoda*, *gasteropoda*, and *cephalopoda*.—Before giving the classifications of Milne-Edwards and Agassiz, which seem to be the truest to nature, it will be instructive to glance at a few physio-philosophical and embryological systems as compared with the preceding founded upon anatomical structure. Oken (1809-'48) places the mollusca in his province of *dermatozoa* (sensitive or tegumentary animals) or *splanchnozoa* (visceral or fleshless animals), and in the circle of vascular, sexual animals, equivalent to *malacozoa* and *conchozoa* (glandular or shell animals); according to the anatomical system, the vascular animals are either venous (like mussels), arterial (like snails), or cardiac (like kraken or cuttle fishes); according to the development of the feeling sense, the sexual animals (the same as the vascular) are either ovarial, orchitic, or renal. In his system (see his "Physiophilosophy," Ray Society ed., 1847) the first class of mollusks, (venous, ovarial animals or mussels) has the following orders: I. Protozoid mussels, with the families: 1, infusorial mussels or *pholades*; 2, polypary mussels or *tellinida*; and 3, aculephan mussels or *cardiaceæ*. II. Conchozoid mussels, with families: 4, typical mussels; 5, snail mussels or *arcaceæ*; and 6, kraken mussels or *ostraceæ*. This corresponds to the *acephala*, and is characterized by a membranous heart with 2 auricles. The second class (arterial, orchitic animals or snails) has the following orders: III. Protozoid snails or *androgynei* (bisexual), with the families: 7, infusorial snails like *doris*; 8, polypary snails or *patella*; and 9, aculephan snails or *limacida*. IV. Conchozoid snails or *diæcii* (with separate sexes), with the families: 10, mussel snails or *capulida*; 11, typical snails or *turbinida*; and 12, kraken snails or *buccinida*. This class corresponds to gasteropoda, having a membranous heart with one auricle. The third class (cardiac, nephritic animals or kraken) has the following orders—

V. Protozoid kraken, with the families: 13, infusorial kraken or *salpa*; 14, polypary kraken or ascidians; and 15, acalephan kraken or cirripeds. VI. Conchozoid kraken, with the families: 16, mussel kraken or brachiopods; 17, snail kraken or pteropods; and 18, typical kraken, cephalopods or cuttle fishes. It will be seen from this system that the principles of Cuvier respecting the different plans of the 4 great divisions of the animal kingdom are entirely set at nought, orders, according to Oken, representing in their respective classes the characteristic features of the lower types.—Oarus (1818-'36) makes the mollusks his 2d circle or *corpus*, and 2d class or *gastrozoa*, with the following 8 orders: 1, *apoda* (ascidians), related to *prolasoa*; 2, *pelecypoda* (common bivalves), related to acalephs; 3, *gasteropoda* (snails); 4, *crepidopoda* (chiton); 5, *pteropoda*; 6, *brachiopoda*, and 7, *cirripedes*, both related to articulates; and 8, *cephalopoda*, related to fishes.—Among the embryological systems may be mentioned those of Von Baer, K  lliker, Van Beneden, and Vogt. Von Baer (1827-'8) calls the mollusks the massive type, as the body and its parts are formed chiefly in round masses, the shape unsymmetrical, the nervous ganglia diffused and appearing late, and the movements slow and feeble; in the course of development identical parts are produced, curving around a conical or other space. According to K  lliker (1844), in the mollusks the embryo arises from a primitive part, grows uniformly in every direction, and either entirely encloses the embryonal vesicle, early in gasteropods and *acephala*, or late (forming a temporary vitelline sac) as in *limax*, or else contracts above the embryonal vesicle, forming a genuine vitelline sac, as in cephalopods. Van Beneden (1845-'55) places mollusks with worms and radiates under his group of *allocotyledones* or *allovitellians*, in which the vitellus or yolk enters the body neither from the ventral nor from the dorsal side; his class *mollusca*, at the first date, included cephalopods, gasteropods, pelecypods, and brachiopods; in his later work he added *acephala*, *tunicata*, and *bryozoa*, removing the last two from the polyps; the cephalopods, however, are not *allovitellians*, and any classification which unites in one group mollusks, worms, and radiates cannot be founded on correct principles. Vogt (1851) adopts the distinction of K  lliker, of animals in which the embryo is developed from the whole yolk, and those in which it arises from a definite part of it; in the former of which he places mollusks, with worms and radiates; he makes a primary division of the cephalopoda, in which the yolk is cephalic, with a class of the same, with the orders *tetrobranchiata* and *dibranchiata*. In the division *mollusca*, with an irregular disposition of the organs, he makes the following classes. I. *Cephalophora*, with sub-classes: 1, *pteropoda*; 2, *heteropoda*; and 3, *gasteropoda* (with orders *brachiata* and *pulmonata*). II. *Acephala*, with sub-classes: 1, *brachiopoda* (with

orders *rudista* and *brachiopoda*); and 2, *lamellibranchia* (with orders *pleuroconcha*, *othoconcha*, and *inclusa*). III. *Tunicata*, with orders *ascidia* and *biphora*. IV. *Ctenophora*, subdivided only into families. V. *Bryozoa*, with orders *stelmatopoda* and *lophopoda*. The last 8 classes constitute his *molluscoidea*. The separation of the cephalopods is unjustifiable, and the transfer of the *ctenophora* from acalephan radiates to mollusks cannot be maintained.—Milne-Edwards (1855) divides the 3d branch, *mala-cozoaria* or *mollusca*, into the 2 sub-branches: 1, mollusks proper, with the classes of cephalopods, pteropods, gasteropods, and *acephala*; and 2, *molluscoidea*, with the classes *tunicata* and *bryozoa*.—Prof. Agassiz, in his "Essay on Classification" (1857), makes only 8 classes of the branch of mollusks: I. *Acephala*, with orders: 1, *bryozoa* (including the *corticellae*); 2, *brachiopoda*; 3, *tunicata*; and 4, *lamellibranchiata*. II. *Gasteropoda*, with orders: 1, *pteropoda*; 2, *heteropoda*; and 3, *gasteropoda* proper. III. *Cephalopoda*, with orders: 1, *tetrabranchiata*, and 2, *dibranchiata*. This classification is founded on both anatomical and embryological characters. Cirripeds unquestionably belong among articulates; he includes *bryozoa* among mollusks, uniting with them the *corticellida*, the plan of their structure not being radiated, but distinctly bilateral, and gradually leading through the brachiopods and tunicates to the ordinary *acephala*; *tunicata* show in the simple ascidians pedunculated young, resembling *boltenia*, and forming a connecting link with the compound ascidians; cephalopods are homologous with other mollusks in all their systems of organs, and can no more properly be separated from them as a distinct branch on account of the partial segmentation of their yolk, than can the mammalia from other vertebrates on account of its total segmentation in their case. Prof. Owen, in his article "Mollusca" above cited, makes the boundaries of the class a little different; according to him, some of the compound ascidians have certain affinities to the zoophytes; some of the marine *apneusta* (like *acteon* and *glaucus*) are related to some of the abbranchiate annelids; though cephalopods are the highest, they do not pass into *amphioxus* or any other embryonic form of vertebrate; he retains the bryozoa with the polyps.—Other classifications might be given, but these will suffice to show the progress of the science from Linn  us to the present time. The classification of Prof. Agassiz is probably the truest to nature of any yet made public.

MALACOPTERYGIANS, a division of fishes established by Artedi in the early part of the 18th century, including such as have the fin rays soft, except occasionally the first of the dorsal or pectorals. Cuvier divided them into 3 orders: 1, the abdominal, in which the ventrals are suspended to the under part of the abdomen, behind the pectorals, and not attached to the scapular arch, comprising the greater part of fresh water fishes, as the carp, pike, cat fish,

salmon, herring, and their allies; 2, the subbrachian, having the ventrals attached under the pectorals, the pelvis being suspended to the scapular arch, comprising fishes like the cod, flounder, turbot, &c.; 3, the apodal, wanting ventrals and sometimes the pectorals, including the eel family. J. Müller limits the term to the group *scomberesocidae* of the sub-order *pharyngognathi*, including the flying fish. This is rejected by Van der Hoeven, who returns to Cuvier's divisions, adding, however, a few families. (See FISHES, and ICHTHYOLOGY.)

MALAGA, a province of Spain in Andalusia, bounded N. by Cordova, E. by Granada, S. by the Mediterranean, and W. by Cadiz and Seville; area, 4,792 sq. m.; pop. in 1849, 488,000. The Genil and Salado rivers are on its N. border, and the Guadiaro on the W.; the Guadalquivir flows through the centre, and the Rio Velez in the E. Most of these in the dry season are exhausted, but during the rains are swollen to rapid and frequently destructive torrents. Its surface is mountainous, being traversed by ranges of the Sierra Nevada. Lead, iron, graphite, and copper are found. The valleys are fertile, yielding abundantly of fruit, especially the grape. The climate is suitable for the cultivation of the sugar cane, the cotton plant, and the palm tree. Wine, brandy, raisins, figs, melons, lemons, and other fruit are its chief productions, and with anchovies and other fish form its principal exports. It has manufactories of linen, woollen, silk, sails, rope, soap, leather, oil, &c.—MALAGA (anc. *Malaca*), the capital, is situated on the Mediterranean, 55 m. S. W. from Granada; pop. in 1847, 68,577; present pop. about 80,000. It is built at the extremity of a wide and deep bay in which a harbor is formed by a mole 2,652 feet long, and surmounted by a lighthouse 180 feet high. The river Guadalmedina, after receiving the Guadalquivir, has its outlet at this place. It is a torrent in winter, but almost dry in summer. The city to the E. and W. is surrounded by mountains, on one of which is an old Moorish castle, built in 1280 and called Gibralfaro. It is laid out in the form of an amphitheatre, and is surrounded by a double wall, with 9 gates and several towers. The streets in the interior are narrow and ill paved, many of them not being wide enough for the passage of vehicles. The Alameda or public walk is 80 feet wide, planted with trees, with carriage ways on each side, rows of buildings beyond, and a beautiful marble fountain at the extremity. A new quarter of the city near the Alameda, occupied by rich merchants, native and foreign, is handsomely built. The cathedral, a compound of Spanish and Italian architecture, erected in the 16th century, has a spire 302 feet high. Opposite is the bishop's palace. The custom house, in the N. E. part of the town, is a very fine building, begun in 1791, but not finished till 1829. Among other public buildings are 4 hospitals, a theatre, and a naval college. The old Moorish dockyard, now within the limits of the

town, from the recession of the sea, is used as a storehouse. A Protestant cemetery has been handsomely laid out about 1 m. from the city; it lies on the side of a declivity between the sea and the citadel.—The exports consist chiefly of the products of the province, the principal being wine and raisins. The latter, which have been improving in quality for a number of years past, are made from the June vintage; a second and third harvest are made into wine, of which there are many varieties and qualities. The best sweet wines are the Muscatel and Vino de Guindas, or wine flavored with cherries; Malaga or mountain wine is made in October and November. The entire production of the vineyards around Malaga is estimated at 40,000 butts, of which 27,000 are exported. Among minor articles of export are olive oil, saffron, vermicelli, anchovies, cummin and anise seed, soap, figs, almonds, grapes, orange peel, lemons, silk, and leeches. The principal imports are hardware, linen, woollen, silk, and cotton fabrics. In the town are manufactories of soap, leather, linen cloths, and cigars. There are 2 iron foundries for the refining of iron made at Marbella, the ore of which is obtained from the rich mines of Sierra Blanca near that place.—Malaga was founded by the Phœnicians, and subsequently passed under the dominion of Carthage and of Rome. Its name is variously derived. Humboldt ascribes it to the Iberians; others connect it with *melah*, salt fish, for the exportation of which it was famous. In 714 it was seized without opposition by the Moors, who held it until 1487, when it was taken by Ferdinand the Catholic after a protracted and dreadful siege. In 1810 Sebastiani, the French general, took and sacked the city, exacting a contribution of 12,000,000 reals. It was again taken by the French in 1828. Gen. Torrijos and 49 liberals suffered military execution in this city on Dec. 11, 1831. A monument has since been erected to their memory in the Plaza del Riego.

MALAN, CÉSAR HENRI ABRAHAM, D.D., a Swiss theologian and author, born in Geneva, July 8, 1787. His ancestors, who were noble and Protestant, fled on account of persecution from Mérindol in southern France to Switzerland in the 17th century. At an early age he became a minister of the state church and a regent in the college of Geneva. Afterward, through the influence of Dr. Mason of New York and Robert Haldane of Scotland, from a Socinian he became a Trinitarian, and the leader of an independent establishment, in which he received much sympathy from English and Scotch Christians. He has often visited England, and Prof. Wilson, in his "Noctes Ambrosianæ," in 1828, speaks of his eloquence. All his publications are of a religious character, and many have been translated and republished in England and the United States. Among these are the "Church of Rome," translated by Robert Baird, D.D. (New York, 1844); "Stories for Children" (1852); and "Pictures from Switzerland" (1854).

The American tract society and the publishing department of the Dutch Reformed church have printed many of his tracts. His most important work is his volume of hymns, entitled *Chants de Sion*, of which he composed both the words and the music. He has been termed the French Dr. Watta.—SOLOMON O., son of the preceding, born in Geneva in 1812. After completing his education at Geneva he went to Oxford, where he was graduated. At the age of 22 he was appointed professor of oriental languages in the Bishops' college, Calcutta. On account of impaired health, he returned after a few years to England. Subsequently he visited the East, and resided for a time in Arabia, where he acquired many Arabic dialects. He made some very accurate and beautiful sketches of the remains of Nineveh, for the use of which Mr. Layard acknowledges his obligations. He spent some time in the Armenian convent near Venice, where printing is done in 38 languages. He became the intimate friend of Mezzofanti, since whose death he is supposed to have no superior as a linguist. He is able to use in conversation familiarly 26 languages, and to translate no fewer than 122. He has published but little; "Magdala and Bethany," and "God in the Chinese Language," are the most important of his writings. He is now rector of Broadwindsor, Dorsetshire, England.

MALARIA (Ital. *mala aria*, bad air), or **MARSH MIASM** (Gr. *μῆναι*, to infect), an emanation which produces in mankind intermitting and remitting diseases. This poison is not cognizable by the senses, nor can it be detected by chemical tests; it is known only by its effects. The concurrence of vegetable matter susceptible of decay, of moisture either on the surface or a short distance below it, and of a certain elevation of temperature, is necessary for its evolution; of these, long continued heat has the greatest influence in increasing the intensity of the poison. Comparatively harmless in the northern part of the temperate zone, it becomes malignant and deadly in places equally favorable to its production, just in proportion to the increase in the mean annual temperature. As the term marsh miasm implies, marshes, whether salt or fresh, and wet meadows are especially subject to malaria, particularly when drying under the influence of a hot sun. Grounds alternately flooded and drained are fertile sources of it, and it is this which renders the cultivation of rice so deleterious. Grounds which, from the nature of the sub-soil, retain the moisture a short distance beneath the surface, though that may be dry and parched, are favorable to the production of malaria. The process of clearing a new country of its woods, and thus exposing the soil to the full action of the sun, is commonly followed by the prevalence of fevers; and the same evils often follow the ploughing up of meadow lands. It is not necessary that the amount of the vegetable matter be great or its growth recent, since malarious diseases have often been caused by the drainage

of ponds and lakes; and the fevers that prevailed at Bourg-en-Bresse ceased on filling in the half wet ditches of the fortifications. The low grounds on the margin of lakes and the alluvial lands bordering rivers in warm countries are always plagued with malaria. In India ground covered with low thick growths of brushwood or of weeds and grass, called jungles, are so well known to produce malarious fevers, that they are there termed jungle fevers; even open woods in tropical climates are productive of malaria. The steeping of hemp and flax, and the decay of vegetable refuse, potatoes, &c., in confined localities, as cellars or the hold of a vessel, have resulted in fever.—The quantity of water required for the generation of malaria is not large, a marsh completely covered with water being innocuous; it is only when the moisture is drying up under the influence of a hot sun, that it becomes pestilential. So in tropical climates disease prevails chiefly at the commencement and after the termination of the rainy season, and is less prevalent while the earth is saturated. In some cases the quantity of vegetable matter concerned in the production of malaria must be exceedingly small. Dr. Ferguson, one of the medical officers in the army of the duke of Wellington, says: "In Spain, during the month of May, 1809, which was cold and wet, the army remained healthy; but in June, which was remarkably hot and dry, marching through a singularly dry, rocky country of considerable elevation, several of the regiments bivouacking in the hilly ravines which had lately been water courses, a number of the men were seized with violent remittent fever (the first which had shown itself on the march) before they could move from the bivouac the next morning; and this portion of the troops exclusively were affected with this disorder for some time. In this instance, the half dried ravine having been the stony bed of a torrent, in which soil never could be, the very existence of vegetables, and consequently of their humid decay and putrefaction, was impossible, and the stagnant pools of water still left among the rocks by the water course were perfectly sweet. Yet this situation proved as pestiferous as the bed of a fen." ("On the Nature and History of Marsh Poison," Edinburgh, 1821.) Here, however, the total absence of vegetable matter would be difficult to prove, and would be in contradiction with all other experience.—Whatever may be the nature of malaria, it is most concentrated near the surface of the earth, and becomes weaker as we rise above it; it is also most active at night, probably from the influence of the sun in rarefying and producing currents in the atmosphere, and perhaps, too, because it has a peculiar affinity for the fogs that are then apt to prevail. In malarious countries it is well known that exposure to the night air is apt to be followed by fever, and that those who sleep in the upper rooms of a house are safer than those who lodge on the ground floor. While as a general rule low and damp grounds

are much more unhealthy than the hills in their neighborhood, yet there are numerous instances in which this rule does not hold good, or is even reversed. The experience of the British army in the East and West Indies is conclusive on this point. In many instances this can readily be explained by the effect of winds and currents of air carrying the malaria to the higher, which had been generated on the lower ground; thus in Italy the malaria from the borders of Lake Agnans reach as far as the convent of Camaldoli, situated on a high hill 8 miles distant. Connected with the propagation of malaria by currents of air is the fact that woods sometimes act as a screen, protecting a place from the malaria which would otherwise be conveyed to it from some neighboring source; in Italy fevers have frequently become prevalent on the cutting down of trees which have thus served as a shelter. It becomes an interesting question how far malaria can be carried by winds. This has been very variously estimated; probably 8 or 4 miles is the maximum.—The effects of malaria are by no means confined to the production of fevers and diseases of an intermittent type, but it is only in warm climates and in certain unfavorable localities that its full effects upon the constitution are observed. In such places the growth is stunted, the complexion sallow, the limbs slender, the abdomen tumid, the hair lank and scant, and the teeth defective; life is commonly extinguished before 40 years of age, and the population is only kept up by immigration from healthier localities. Yet it is remarkable that when in such places persons live beyond their 40th year, they frequently recover some measure of health and attain to old age.

MALAY ARCHIPELAGO, MALAISIA, or INDIAN ARCHIPELAGO. See ARCHIPELAGO.

MALAY LANGUAGE, the most widely diffused of the many languages of the Indian archipelago. The Javanese is spoken by a greater number of people, but is confined to the island of Java, while the Malay is heard, more or less, on most of the islands from Sumatra to Amboyna, and even beyond. Simple in structure, pleasing to the ear, and easily learned, it forms the common medium of communication where different languages come in contact. Even the Chinese, to whom all European and most Asiatic languages are difficult, acquire it with considerable facility. In marts of commerce, like Singapore, Malacca, Penang, Batavia, Macassar (but not Manila), where many races and languages are brought together, it proves a great convenience and a bond of union. In saying that the Malay is easily learned, the common language of the street and bazaar is meant, and not the language of books. This last is somewhat difficult, and is made more so by the Arabic alphabet in which it is commonly written, but which is poorly adapted to the Malay. For instance, the word *suka*, glad, is written *sk*, or sometimes *suk*; *menuntut*, to demand, is written *mnntt*, omitting all the vowels. (Marsden's

Dictionary, 174–445, and 387–406.) Beside, by this alphabet, which fails to distinguish many of the vowels and often omits them altogether, entirely different words, happening to have the same consonants, are written alike and thus confounded. This language can be written, and sometimes is, in Roman letters, which express the Malay sounds with ease and precision. Crawford, whose grammar is the latest and best, says: "The great majority of radical words are dissyllables; a few consist of three syllables, a still smaller number of four; there are a good many monosyllabic words, and words of two syllables abbreviated into one." He supposes *kari*, dagger, to have been shortened into *kris* in the colloquial; *amas*, gold, into *mas*; *ambun*, dew, into *bun*. But the movement of the words may have been in the contrary direction. That the present Malay ear delights in dissyllables is certain; and the educated, or rather the refined class (for there is no enlightened class), are those who incline to change monosyllables into dissyllables. For example, the monosyllabic *bras*, the word for rice throughout the archipelago, is, in the petty court of Bruni, pronounced as a dissyllable, *baras*. The accent, which is weaker than in English, commonly falls on the penult. Gender, number, person, relation, time, are not indicated by inflections, but by adjectives, prepositions, and auxiliaries. *Anak* is child; *anak-laki* is man-child, or son; *anak-perempuan* is woman-child, or daughter. Number is often to be gathered from the context; sometimes it is formed by reduplication, as *raja-raja*, princes. The adjective is distinguished from the noun by position, not form, belonging after the noun. *Putih* is white, *kain putih* is white cloth, but *putih kain* is whiteness of cloth. The numerals are: 1, *satu*; 2, *dua*; 3, *tiga*; 4, *empat*; 5, *lima*; 6, *enam*; 7, *tujuh*; 8, *delapan*; 9, *sambilan*; 10, *puluh*; 100, *ratus*; 1,000, *ribu*; 10,000, *laka*. The last is from the Sanscrit, but it there means 10 times as much, that is, 100,000, heard every day throughout India in the words "lac of rupees," a phrase which has found its way even into English dictionaries. The Malays, in spreading their numerals to many languages, propagated also this mistake as to the original meaning of *laka*. When they received this word their thought could not get higher than 10,000. The pronouns are numerous, as many as 30, but only 4 are much used: *saya*, *kita*, *engkau*, I, we, you; and *dia*, he, she, it, and they. A considerable number of inseparable particles, prefixes and suffixes, are applied to verbs, to distinguish them from other parts of speech, or to give them a transitive sense; but this peculiarity is found mostly in the written language, less frequently in the spoken. From *prang*, battle, we have *berprang*, to war; from *bunih*, fruit, *berbunih*, to bear fruit; from *diri*, self, *berdiri*, to stand; from *estri*, woman, wife, *berestri*, to be wived. The word *estri* is from the Sanscrit, indicating perhaps that the Malays received the institution of marriage from the Hin-

doos; or the Sanscrit word, seeming more refined, may have thrown out of use an old Malay word now lost. The Malays have now, however, other words for marriage, one from the Persian, and another from the Arabic. The prefix *ber* occasionally becomes *per*, for euphony. The suffixes *kan* and *i* are transitive or causative particles, both producing commonly but not always the same effect. *Putihkan* means to whiten; *panjang*, long, *panjangkan*, to lengthen; *baik*, good, *baikan* or *baiki*, to make good or mend; *diya*, his or hers, *diyakan*, to make his or hers. The prefix *di* gives a passive sense to a neuter or an active verb; sometimes *ter* and *ka* produce the same effect.

*Mukanya manis kaplu-piluan,
Saperti bulan disapu awan.
Her face is sweet and tender,
Like the moon swept by clouds.*

This couplet is quoted to illustrate the effect of *di* in *disapu*; it also illustrates the capability of the language for poetry. The prefix *me*, followed by *m*, *n*, or *ng*, for euphony, shows that the word to which it is prefixed is a verb, a little like our particle *to*. *Bri* and *membri* have the same signification, to give. *Lain*, different; *melain*, to be different; *melainkan*, to make different or to distinguish. By the suffix *an*, either alone or with the prefix *ber* or *ka*, are formed participles, adjectives, and abstract nouns:

*Ditais kuda iya berkandoran,
Pamat, muda, bangawan.
On a horse riding,
Fair, young, high-born.*

Verbs take a frequentative sense by repetition of the radical. *Sagala dayung-dayung tertawa-tawa*, "All the girls kept on laughing." *Iya pergi berlari-lari, dan berlompat-lompat*, "They went on running-running and leaping-leaping." The future tense is indicated by *mau* or *andak*, will, want, intend. *Kalau mau pergi* means either, if you want to go, or if you will go. *Tuhan A. mau berlayer esok*, "Mr. A. intends to sail to-morrow." Past time is expressed by placing before the verb *sudah*, *telah*, *abis*, or *lalu*, done, past, finished, gone. *Sudah buat ini terlalu baik*, "You have done this very well." The suffixes *lah*, *tah*, *pun*, and *maka*, and, are chiefly used as expletives, though occasionally they add a little strength or definiteness to the sentence. These, and some other words of little or no meaning, are often used in prose composition somewhat as we use punctuation marks, to mark paragraphs, sentences, and clauses. Conversation dispenses with these cumbrous helps, securing the same end by means of intonations. A considerable number of adverbs are formed by prefixing to the noun or adjective the abbreviated numeral *sa*, one. *Saorang*, alone, literally one man or person; *sakali*, once, one time; *sabanar*, rightly, from *banar*, right. By affixing the pronominal suffix *nya*, of his, her, it, the adverb is sometimes made a little more expressive; thus, *saorannya*, alone, or one man alone of it. By reduplication, *adari-ari*, daily. The principal conjunctions are *dan*, and; *atawa*, or; *tatapi*, but; *kalau*, if; *saperti*, as.—The

merits of the Malay as a written language, and especially for prose, are small. But for conversational purposes, among a simple, refined, yet ignorant people, it is very beautiful. Many of its compound words are striking and picturesque. Take the following: *anak-dayung*, child of the oar, a rower; *ibu-jari*, mother of the fingers, the thumb; *batu-brani*, brave-stone, the magnet; *karantan-ati*, rust of the heart, malice; *anak-kunchi*, child of the lock, a key; *mata-ayer*, eye of water, a spring; *manis-mulut*, sweet-mouthed, eloquent; *mulut-panjang*, long-mouthed, babbling; *mabuk-ombuk*, wave-sick, sea-sick; *mata-ari*, eye of the day, the sun; and many more scarcely less poetic. Crawfurd finds in the Malay dictionary (there are over 10,000 words in Crawfurd's, and about a quarter less in Marsden's) 516 words from Sanscrit, 750 from Arabic, 95 from Persian, 40 from Telugu, and 37 from Portuguese; he might have added a very few from Chinese and English. The words common to the Malay and Javanese are very numerous, but which has borrowed most largely from the other, or whether both have borrowed from a common source, are questions not easily settled. The words derived from the Sanscrit, though less numerous than those from the Arabic, are more deeply imbedded in the language. *Surat*, writing, is from the Arabic, but *kata*, to speak, is from Sanscrit; *sudagar*, merchant, is from Arabic, *sudara*, brother, sister, from Sanscrit. This last Sanscrit word, and a few others which seem to approach the very cradle of language (though it may still be far removed perhaps), have led some philologists to conclude that the Malay may have been derived indirectly if not directly from the Sanscrit. Crawfurd gives good reasons for rejecting this conclusion. For these reasons we must refer to his learned and very valuable "Preliminary Dissertation," prefixed to his "Malay Grammar and Dictionary" (2 vols., London, 1852). Marsden, observing that there are Malay words widely scattered throughout the islands of the Indian and Pacific oceans, from Madagascar to Easter island, more than half round the globe, took up the hypothesis of Forster, that the 100 or more existing tongues of this vast region had a common origin. He made a polyglot vocabulary of 84 words, in which 80 languages are represented, and with much learning built up a theory which was long and generally received. W. von Humboldt's vocabulary extended to 134 words, in which 9 languages were represented. Crawfurd, with more abundant materials than his predecessors, and proceeding on the idea that men invent languages as they do clothes, houses, and ships, concludes that most of these languages are indigenous, and that the Malay and Javanese words found in them are imported. Instead of taking nouns, adjectives, and verbs for the basis of his comparisons, as Marsden and Humboldt had done, he goes to the particles and auxiliaries, the hinges of language, which pass less easily from language to language, and mark more decisively the original growth.

On this point we refer again to his elaborate dissertation. Though Crawford's dictionary is on the whole the best yet published, it does not in all respects supersede the excellent dictionary of Marsden (4to., London, 1812). This has the advantage of giving the Malay words in the Arabic as well as the Roman character, and the Sanscrit words in the Devanagari; and it abounds in Malay phrases and sentences illustrating the use of words; so that the careful student should have both works.—Malay literature consists of songs, legends, romances, and a very little that may be called history and biography. There are in circulation from 100 to 200 manuscripts. Only two works are known to have been printed. One is the *Sejarah Melayu*, "Malay History," printed in Singapore in 1841, in the Arabic character, under the careful superintendence of the Rev. A. North, a superior Malay scholar, and Abdullah, a Malay teacher and author. The other is Abdullah's "Journal" (Singapore, 1838, pp. 159), in Roman and Arabic on alternate pages. There is probably no better specimen of Malay composition of the present century. The *Sejarah Melayu* was translated by Dr. Leyden ("Malay Annals," 8vo., London, 1821). Reference should also be made to "Memoirs of a Malayan Family, written by themselves, and translated by W. Marsden" (London, 1830). This little book gives a pleasing and genuine specimen of Malay life, manners, and habits of thought, presenting a truer picture of the Malays than we get from hearing of them only as pirates. Piratical they certainly are, but less so than our worthy ancestors, the Saxons, Danes, and Northmen. Mr. Marsden also commends the book for its style, as "affording a specimen of simple narrative; a style of which some writers have thought the Malays incapable, and which is certainly rare in comparison with the romantic and extravagant tales so prevalent among these and other eastern people." Dr. Leyden's learned essay on the "Languages and Literature of the Indo-Chinese Nations," in vol. x. of the "Asiatic Researches," should not be forgotten. He gives 26 pages to the Malay (168–189), and brief specimens of their poetry. See also an able article in the "Foreign Quarterly Review," Dec. 1834. The Gospels of Matthew and Mark were translated into Malay as early as 1629 (2d ed., Amsterdam, 1638); Luke and John at Amsterdam in 1646 and 1648; the four Gospels and Acts in 1651; the Evangelists and Acts in Roman characters at Oxford in 1677, reprinted in 1704. A complete version of the whole Bible in Malayan was published at Amsterdam in 1738, in Roman, and republished in Arabic characters at Batavia in 5 vols. 8vo., 1758.

MALAY PENINSULA, the name given by European geographers to the long and narrow tract which projects southward from Indo-China, and forms the southern extremity of the Asiatic continent, bounded E. by the China sea and the gulf of Siam, and W. by the bay of

Bengal and the straits of Malacca. It is sometimes called by the Malays *Tana Malayu*, "Malay Land," and is supposed to be the Golden Chersonesus of the ancients. It extends from the parallel of the head of the gulf of Siam, in lat. $18^{\circ} 30' N.$, to Cape Romania, in lat. $1^{\circ} 41' N.$, or within 74 m. of the equator; length about 800 m.; greatest breadth about 150 m., least about 60 m., and average breadth somewhat more than 100 m.; area, 88,000 sq. m.; pop. conjectured to be about 500,000. The upper part of the peninsula is the narrowest, and has an area of about 22,000 sq. m., with a population composed of Siamese, or a mixed race of Siamese and Malays called Sansam. The lower part is the country of the Malaya, and has an area of about 61,000 sq. m. Along the shores of the peninsula are many islands, of which the principal are on the W. side, fronting the Malay country. The chief of these are Trutao, Lancava, Penang, Singapore, Batan, and Bingtang. The islands on the E. coast are fewer and smaller. The most important political division of the peninsula is the British province of Malacca (see MALACCA), which, though small in area, has about half the population of the country. The Malay states are Quedah, Perak, and Salangore on the W. side; Patany, Kalantan, Tringang, and Pahang on the E.; Rumbowe, Jehole, and Jompol in the interior; and the principality of Johore, which comprises the S. extremity of the peninsula. A range of granite mountains runs through the whole length of the peninsula, on both sides of which spread alluvial plains, not much elevated above the sea. The most extensive of these plains are on the W. side of the mountains. The rivers are numerous but small, and are not navigable except so far as the tide ascends them. The largest are the Perak, Johore, and Muar on the W. side. The only lake of any considerable extent is called Bran, and lies between Malacca and Penang.—The zoology of the peninsula is varied and extensive. There are 8 species of monkeys, and a sloth called by the Malays the *kukang*, "the lazy." There are several species of bats, of which the most remarkable is the *lar-lung* or vampire, which is larger than a crow, and flies high in great flocks, and is very destructive to fruit. The only plantigrade animal is a small bear of a kind found only here and in Borneo. There are 4 species of weasels and 7 species of the feline family, of which the largest are the leopard and the tiger, both of which are very numerous and destructive to human life. The domestic cat has a tail about half as long as that of the European cat. The domestic dog exists as a vagrant without a master, and there are said to be wild dogs in the forests. The elephant, the one-horned rhinoceros, the Malay tapir, and the wild hog are abundant. Horses are not found either wild or tame. The ox and the buffalo are used for riding and draught. The buffalo attains its greatest size in this country, being much larger than the buffalo of India or that of Italy. The domestic

or is small and short-legged, but strong and hardy; and there are two species of wild ox, one of which, called by the Malays *saladang*, seems to be peculiar to the peninsula. There is a species of wild goat, and a small species of domestic goat. Two species of deer exist smaller than the European hare, a third species about the size of the fallow deer, and a fourth as large as the elk. The sheep and the rabbit are not indigenous, but have been introduced by Europeans. The most remarkable birds are the *merak* or wild peacock, the double-spurred peacock, a small and beautiful species, 3 species of pheasants, a partridge, the wild cock and the domestic cock, the latter a small but very courageous bird. The species of pigeons are very numerous, and some are no larger than a thrush; the prevailing color is green. The parrot family is numerous, but is not remarkable for brilliancy of plumage. The swallow whose nest is eaten by the Chinese is found in the caves of the islands. The birds of prey consist of a variety of kites and hawks. Among the reptiles are the alligator, the iguana, several species of small lizards, and about 40 species of snakes, of which 3 or 4, among them the cobra, are venomous. Fish are very plentiful, and form the principal animal food of the mass of the people. The white pomfret, called *bawal* by the Malays, is said to be one of the most delicate fishes in the world to the European palate. The only cetaceous animal is the dugong.—The botany of the peninsula is as yet imperfectly known. The forests yield ebony, sapan, and eagle wood, and several species valuable for lumber. Ratana, bamboo, and palms furnish most of the materials used by the Malays in constructing their houses. Rice, cocoanuts, rams, the sugar cane, and esculent fruits are the chief products of agriculture. Among the fruits, the *durian*, which resembles in size and form a large melon, is the most esteemed by the natives; while by the Europeans, the mangosteen, which grows abundantly, is considered the finest fruit in the world. Pineapples are produced in great perfection, and are as plentiful as turnips in Europe or America. The most remarkable and valuable product of the peninsula, however, is the gutta percha tree, which was here first made known to Europeans.—Iron, tin, and gold are the principal metals. Iron ores are everywhere found, and in the south they exist in vast profusion. The tin mines are the most extensive in the world; and though they are imperfectly worked, the product in 1843 amounted to 2,400 tons. Tin is found in all parts of the country. Gold is not very abundant, the annual product not exceeding 20,000 ounces.—The climate of the peninsula is hot and moist. The mean annual temperature at the level of the sea is nearly 80°, the mean range being from 70° to 90°. There is no rainy season, but rain falls at short intervals throughout the year, and there are heavy dews and frequent fogs. Generally the climate is not unhealthy, though there are some spots infected

with a most pestiferous malaria.—The native population of the peninsula, with the exception of the Siamese portion and the wandering negritos in the mountains of the north, are of the Malay race, and speak the Malay language. Most of the Malays are settled and civilized, but others lead a nomad life on the land, the rivers, or the sea. The land nomads practise a rude agriculture; the river nomads live entirely in boats, and subsist on fish and wild roots. Their boats are about 20 feet in length; at one end is the fireplace, in the middle their utensils, and at the stern is the sleeping place, where beneath a mat a family of 5 or 6 together with a cat and dog frequently find shelter. In these boats they skirt the shores of the rivers, collecting their food from the forests, and when one spot is exhausted proceeding to another. These people are pagans, and are very ignorant and filthy in their mode of life. The sea rovers roam over the whole archipelago in their prahus or boats, and are generally pirates. The civilized and settled Malays are Mohammedans, and their governments are despotic. The peninsula is supposed by some writers to have been the original seat of the Malay race, and to this day it is the only country exclusively occupied by them; for though widely spread in the islands of the archipelago, they are everywhere intermixed with other races. The civilized Malays, however, all claim to be descended from emigrants from Sumatra, who in the 12th century entered the peninsula at its S. E. extremity, where they founded Singapore, and gradually drove back the indigenous inhabitants into the mountains. Before 1276 the Malays were pagans. In that year Sultan Mohammed Shah ascended the throne and adopted Mohammedanism. He reigned at Malacca, and his successors became powerful monarchs. In the 15th century a large part of the peninsula became subject to the Siamese monarchs. In 1511 Mohammed Shah, the 12th Malayan sultan, was overthrown by the Portuguese under Alfonso d'Albuquerque. At present the peninsula is much less populous than in former ages. Its foreign and intestine wars and the incursions of pirates have contributed to its depopulation. The British territory of Malacca, which embraces only about an 80th part of the area of the peninsula, has as many inhabitants as all the rest of the country.

MALAYS (*Malayu*), one of the great ethnological divisions of mankind, and in a secondary sense a race or nation inhabiting the Malay peninsula and its adjacent islands, and portions of Sumatra, Borneo, and other islands of the East Indian archipelago. In the first mentioned sense, the Malay race is more widely scattered on the globe than any other, and in its institutions and social condition exhibits perhaps greater variety than all the other races combined. It is found in nearly all the islands of the Indian and Pacific oceans, in Madagascar and eastern Africa, and, in the opinion of some, occurs on the W. coast of North America. Its

numbers are computed at 120,000,000. The complexion of this race is very uniform, and is always darker than the Mongolian. It is a reddish brown, approaching the hue of burnished copper. The hair is raven black, coarse, straight, and very abundant. The beard is always thin, and some branches of the race are nearly beardless. The practice of eradicating the beard prevails very generally among this race. The females and young men have almost always flattened noses, though as the men advance in years their noses frequently become aquiline. The lips are thicker than among Europeans. There is less prominence of profile in the Malay than in any other race, a peculiarity which appears to be owing in part to the absence of rigidity in the cartilage of the nose. Dr. Pickering says: "The profile has appeared to me usually more vertical than in the white race; but this may be owing in part to the mode of carriage, for the skull does not show a superior facial angle. A more marked peculiarity, and one very generally observable, is the elevated occiput, and its slight projection beyond the line of the neck. The face, in consequence, when seen in front, appears broader than among Europeans, as is the case with the Mongolian, though for a different reason. In the Mongolian the front is depressed, or the cranium inclines backward, while in the Malay it is elevated or brought forward."—The Malay race is divided into two great families, the Polynesians and the Malays proper, or the Malays of the East Indies; between these divisions there is a singular contrast of stature, the Polynesians being taller than the rest of mankind, and the East Indian Malays shorter. The race has a universal attachment to the water, and to a sea life. They have a strongly marked wandering disposition, caring less for fixed homes than perhaps any other portion of mankind. The Malays proper occupy nearly the whole of the Malay peninsula, about one half of Sumatra, and the whole coast of Borneo. Their numbers are estimated at 2,000,000. They may be divided naturally into three classes: the civilized Malays, who have a written language, and have made some progress in the useful arts; the *orang-laut*, "men of the sea," whose only habitations are boats, and who live entirely by the product of the sea and by piracy; and the *orang-banua*, "men of the soil," or aborigines, who are savages, and live precariously on the produce of the forests. This latter class is found only in the interior of the Malay peninsula, in Sumatra, and in the islands lying between them. The civilized Malays inhabit the eastern side of Sumatra, much of the interior of that island, and the coast of Borneo and the Malay peninsula. Wherever settled, they all claim that the original seat of their ancestors was the kingdom of Menangkabow in Sumatra, which in former ages was a famous and powerful state, and undoubtedly the most civilized and distinguished ever founded by Malays. It is certain, however, that Menangkabow was not the original seat of this race. In fact, nothing is known of

their origin nor of their ancient history. Everywhere throughout the archipelago they are regarded as conquerors and settlers; and everywhere they can easily be distinguished from the aboriginal inhabitants. Even in the Malay peninsula, the southern part of which is exclusively occupied by them, there are traces and remnants of an anterior race. They are all Mohammedans, and throughout the archipelago in the common speech of the natives the term Malay is almost synonymous with Mohammedan; so that when any of the pagans, no matter of what race, learn to write the Arabic character and submit to circumcision, they are said to become Malays. In person the Malays are short and slender, with slight and well shaped limbs, particularly small at the wrist and ankles. Deformed persons are scarcely ever seen among them. The women, however, are accustomed to flatten the noses and compress the heads of newly born children, and to pull out the ears of infants to make them stand erect from the head. Their eyes are uniformly dark and clear, and have sometimes the Chinese peculiarity of formation. Their hair is strong and of a shining black, and that of the men is kept cut short, while that of the women is allowed to grow to great length. The beard is naturally thin, and in Sumatra only the priests allow it to grow; the rest of the men carefully eradicating it. Both sexes also eradicate the hair from every part of the body, and to neglect doing so they regard as highly indelicate.—The dress of the Malay men consists of a close waistcoat, without sleeves, but having a neck like a shirt, buttoned close up to the top with buttons often of gold filigree. Over this they wear the *badjoo*, which resembles a morning gown, open at the neck, but fastened close at the wrist and half way up the arm, with 9 buttons to each sleeve. They are made usually of blue or white cotton cloth; for the rich of chintz, and for the chiefs of flowered silk. They wear short drawers, reaching half way down the thigh, and over all the *cayen sarong*, which resembles a Scotch plaid in appearance, and is flung over the shoulder like a sash, or else folded and tucked about the waist and hips, and bound round the body by a belt of crimson silk in which the peculiar Malay dagger, the *creese*, is worn. They have no covering to their legs or feet, and around their heads they twist a colored handkerchief, so as to resemble a small turban. The women wear a kind of bodice reaching to the hips, and over that the *badjoo* and the *cayen sarong*. A piece of fine, thin, blue cotton cloth, about 5 feet long, called a *salendang*, is thrown across the back of the neck and hangs down before, and is used as a veil when the women go abroad. Their houses are uniformly built of wooden frames, closed in and floored with bamboos, and roofed with bamboos or palm leaves. Their furniture is very simple, comprising generally only mats and large wooden salvers, which are used as tables. They eat with their fingers, and use neither knives, forks, nor chop-sticks. Their food is chiefly rice, though they eat also fowls

and the flesh of the goat and buffalo, and their dishes are almost all prepared in that mode of dressing which we call curry, in their language *goodye*. Their knowledge of the arts and sciences is very limited, their principal manufactures consisting of filigree work in gold, and of iron work chiefly in the shape of creeses and other weapons. They are fond of music, and have many kinds of instruments, but these appear to be mostly of Chinese origin.—The chief mental characteristics of the Malays are pride, cunning, and duplicity. They can dissemble the strongest passions beneath the utmost composure of features till the opportunity of safe gratification occurs. They are jealous and vindictive, and have little sense of veracity or integrity. Their courage is not firm or steady, but the effect of a transient enthusiasm, which however sometimes prompts them to deeds of incredible desperation. They suffer death with astonishing composure and indifference when it is clearly inevitable. Their propensity for gambling and betting is excessive, and they sometimes stake all that they have in the world, and even their personal freedom, upon a cock fight or a combat of lizards or of cockroaches. Their governments are founded on principles nearly approaching the feudal, the power of the chiefs being greatly restrained by laws based upon custom. The rajah or prince often assumes the Arabic title of sultan. Under him are a certain number of *dattoos* chosen from among the body of *orang kayas*, or men of rank, who have usually subordinate to them a considerable train of immediate dependants or vassals. From the *dattoos* the rajah appoints the officers of state, as the *shabandar*, who regulates the customs of the port; the *tamongoong*, or military commander; the *bandahara*, or chief judge, and others. The Malays of the present day have degenerated not only from the power but from the spirit and enterprise of their ancestors, whose princes once swept the Indian seas with great fleets, sometimes of 1,000 vessels, carrying 100,000 fighting men. They are still daring freebooters, but their piracies are no longer carried on with the energy or the numbers of former times, and they seldom venture an encounter with armed European vessels. The more civilized Malays build ships of 200 tons burden, well fitted for navigating the seas of the archipelago. They are active traders, and collect gums and spices and other valuable products from the remotest islands, and convey them to Batavia, Singapore, and other European emporia. Of 42 independent Malay states in existence at the time of the first visit of the Portuguese to the archipelago, only Acheen in Sumatra and Bruni in Borneo still maintain their independence.

MALBONE, EDWARD G., an American portrait painter, born in Newport, R. I., in Aug. 1777, died in Savannah, Ga., May 7, 1807. In early life he evinced much fondness for painting, and was in the habit of frequenting the theatre at Newport to watch the process of

painting the scenes. While yet a boy he executed for this establishment an entire scene, a landscape, the praises bestowed upon which encouraged him to devote his attention exclusively to painting. He employed his leisure time in drawing heads in miniature, and at 17 years of age established himself in Providence as a portrait painter. Meeting with considerable success in this calling, he removed in the spring of 1796 to Boston, where he was well received, and during the next 4 years pursued his art with industry in various cities. In 1800 he accompanied Washington Allston, between whom and himself a warm friendship had been formed, to Charleston, and in the succeeding year the two young artists sailed for Europe. Malbone remained a few months in London, where he was urged by Benjamin West, the president of the royal academy, to take up his permanent residence, with the promise of ample professional employment; but he returned to Charleston in Dec. 1801. For several years he painted miniatures in the chief cities of the United States with great reputation; but his sedentary habits and intense application to his art gradually undermined his health, and in the latter part of 1806 he was obliged to make a voyage to the West Indies. The change of climate not proving beneficial, he returned to the United States, and died in Savannah. Of Malbone's merit as a portrait painter, Allston says: "He had the happy talent, among his other excellences, of elevating the character without impairing the likeness. This was remarkable in his male heads; and no woman ever lost beauty under his hand. To this he added a grace of execution all his own." His works, consisting chiefly of portraits in miniature, are widely distributed, many being owned in Charleston, where he was frequently employed. He painted a few compositions, distinguished by agreeable style and warmth and delicacy of coloring, and occasionally attempted landscape in oil.

MALCOLM, SIR JOHN, a British diplomatist, soldier, and author, born in Eakdale, Dumfriesshire, in May, 1769, died May 31, 1833. He was sent to India at the age of 18, in the charge of his uncle Dr. Paisley, and received a cadetship under the East India company. As he grew older he distinguished himself by bravery and intelligence, and after the fall of Seringapatam was secretary to the commission appointed to divide Mysore. In 1799 he was commissioned by Lord Wellesley, who had become personally familiar with his ability and accomplishments, to negotiate with Persia a defensive alliance against an anticipated French invasion of India. He had at this time acquired several eastern languages, and had been in 1792 staff interpreter of Persian. In 1801 he was appointed private secretary to the governor-general, but was again sent to Persia in the following year. In Feb. 1803, he became commissioner of Mysore, and joined the army of Gen. Arthur Wellesley in the Mahratta campaign. In 1805 he was recalled to Bengal, where he was actively occupied in form-

ing treaties of alliance with native princes. In 1807 he went again to Persia, but did not obtain the advantages hoped for by the British government. He returned to Mysore in 1808, but was again sent to Persia in the following year as plenipotentiary. Here, owing to a change in the ministry, he was received in the most flattering manner, and on his departure in 1810 was honored with the order of the sun and moon and made a khan and sepahdar of the empire. In 1812 Malcoim went to England, was there knighted, and published in 1815 a history of Persia (2 vols. 4to.), the materials for which he had drawn from original Persian annals as well as extensive personal research and observation. On returning to India in 1817, he was at once appointed political agent in the Deccan, with the rank of brigadier-general in the army. He served under Sir T. Hislop as second in command during the Mahratta and Pindarree wars, and especially distinguished himself at the battle of Mehidpoor, in which Holkar was routed. For his bravery on this occasion he received the thanks of the British parliament; Mr. Canning, president of the board of control, spoke of him as "second in command, but second to no one in valor and renown." After this war, Sir John Malcolm was appointed governor of Malwah and the adjoining provinces. The country was then in a state of anarchy, brigandage and rapine being generally prevalent; he succeeded in restoring order, governed mildly but firmly, and effected a vast amount of good. An account of this part of India was published by him in 1823, under the title of "A Memoir of Central India." He was in England from 1821 until 1827, when he was appointed governor of Bombay, which office he held for 8 years, and then returned to England. He was elected not long afterward to parliament for Launceston, and distinguished himself by active opposition to the reform bill. A monument was erected to his memory in Westminster abbey, and also an obelisk 100 feet high near Langholm, in Eskdale. In addition to the works above mentioned, he published a "Sketch of the Political History of India from 1784 to 1823" (London, 1826), and a "Life of Lord Clive" (1836).—See "Life and Correspondence of Major-General Sir John Malcolm, G.C.B.," by John W. Kaye (2 vols. 8vo., London, 1856).

MALCOM, HOWARD, D.D., an American clergyman and author, born in Philadelphia in Jan. 1799. He entered Dickinson college, Carlisle, Penn., in 1813, was licensed to preach in May, 1818, by a Baptist church in Philadelphia, and entered Princeton theological seminary, where he remained 2 years, acting gratuitously at the same time as pastor of a church near Princeton. On finishing his studies, he married and settled over a church in Hndson, N. Y., and was afterward settled in Boston and Philadelphia. He was president of the college at Georgetown, Ky., from 1839 to 1849, and of the university at Louisville, Penn., from 1851 to 1859, having been obliged by the failure of his voice to relinquish

preaching. In both institutions he filled also the chair of metaphysics and moral philosophy. The disease in the throat increasing, he has retired to private life in Philadelphia. In 1841 he received the degree of D.D. simultaneously from the university of Vermont and Union college, N. Y., and after his resignation at Lewisburg was made LL.D. by that institution. He has visited most of the countries of Europe, and travelled as a deputation from the Baptist missionary society in Hindostan, Burmah, Siam, China, and Africa. He was one of the founders of the American tract society, of which he has been a vice-president from the beginning. He was also one of the prominent laborers in establishing the American Sunday school union, having visited on its behalf, when first organized, every principal city in the United States. His published works are: a "Dictionary of the Bible," which has passed through 140 editions in America and several in London; "The Extent of the Atonement;" "The Christian Rule of Marriage;" "Memoir of Mrs. Malcom;" and "Travels in South-Eastern Asia" (2 vols. 12mo., Boston, 1839). He has also published several addresses and other tracts, and edited the "Imitation of Christ," Law's "Serious Call," Keach's "Travels of True Godliness," Henry's "Communicant's Companion," and Butler's "Analogy of Religion."

MALCZEWSKI, ANTONI, a Polish poet, born in Volhynia about 1792, died in Warsaw, May 2, 1826. He studied at the school of Krzemieniec, entered the national army in 1811, and left it in 1816, having fractured his leg by a fall from a horse. He subsequently travelled in Italy, Switzerland, and France, returned to Warsaw in 1821, and soon after to Volhynia, whence he eloped to Warsaw with the young wife of one of his neighbors, whom he had cured of a dangerous illness by magnetism. Want and misery, however, soon embittered the life of the lovers, and hastened the death of the poet. His principal work, *Marja* (Warsaw, 1825), a metrical romance in the style and spirit of Byron, which appeared in the last year of his life, was severely criticized, but is now generally recognized as one of the gems not only of Polish but of modern poetry. It has passed through numerous editions, and has been translated into French by Clémence Robert, and into German by K. R. Vogel.

MALDIVES, a chain of small coral islands in the Indian ocean, about 400 m. W. from Ceylon, extending in a straight line from lat. 7° 6' N. to 0° 40' S., between long. 72° 48' and 73° 48' E. The length of the chain is about 500 m., and its breadth about 50 m. The number of islands is commonly stated by the natives at 12,000, but is supposed to be in reality nearly 50,000. The great majority of them are mere rocks or sand banks, and only the larger islands are inhabited. They are divided into 17 atolls or circular groups, each atoll being enclosed by a coral reef generally about 90 miles in circumference. (See ATOLL.) These reefs have chan-

nels through them navigable by the boats of the natives; and though the sea beats with great violence on the outside, the water within the reefs is calm and generally shallow. There are deep channels between the atolls, 4 of which have been examined by European vessels and found navigable by the largest ships. The principal island is Mali, in lat. $4^{\circ} 10' N.$, long. $78^{\circ} 40' E.$ It is 7 m. in circumference, and contains 2,000 inhabitants. It is the residence of the sovereign, who bears the title of sultan of the Twelve Thousand Isles, and who acknowledges some degree of dependence on the British government of Ceylon, to which he annually sends an embassy with tribute. The population of the whole cluster is estimated at 200,000. The highest land in the islands is only 20 feet above the sea. Each island is circular in form, and has a lagoon in the centre. The soil is sandy, and at the depth of 8 feet a layer of sandstone is found. The inhabited islands are richly wooded with palms, fig trees, citron trees, and bread-fruit trees. They produce abundance of millet, and of a similar small grain called *brindy*, of both which the inhabitants reap two harvests in the year. They also gather various roots, which, with rice imported from Hindostan, and fish and cocoanuts, constitute their food. The climate of the islands is excessively hot, though the nights are cool and the earth is refreshed by heavy dews. They are unhealthy for Europeans. From April to October is the rainy season, during which the westerly winds are boisterous. In the dry season, from October to April, the winds are easterly. The islands breed prodigious numbers of wild ducks, pigeons, and other wild fowl, which are much used for food, and sold very cheap. There are no large quadrupeds except a few sheep and cows. Oats, polecats, and ferrets are found, and rats are very numerous and troublesome. There is a poisonous species of water snake, and the mosquitoes are said to be larger and fiercer than in any other part of the East Indies.—The Maldivians are strict Mohammedans. They are handsome, well made, and generally of an olive complexion, though some have much fairer complexions than others, which is probably attributable to their descent from Persian or Arab stock, while the majority of the population are obviously of Hindoo origin. The people are ingenious and industrious, and have attained to some degree of civilization. They clothe themselves in silk or cotton robes, and are cleanly in their habits, both sexes bathing regularly once a day. The men shave their heads, but allow their beards to grow. The women allow the hair to grow long, and fasten it up behind. They are not secluded as in other Mohammedan countries, but enjoy a tolerable degree of liberty. The Koran is the supreme law, but there are various peculiar local laws and usages. An insolvent debtor becomes the servant of the creditor until the debt is worked out. The ordinary punishment for criminals is whipping, which is sometimes inflicted so severely as to produce

death. Frequently criminals are punished by banishment to the southern islands, which are less civilized than the northern. The people learn to read and write Arabic as well as their own native language, and they have schools in which the mathematics are taught. Polygamy to the extent of 8 wives is tolerated, and divorce is restricted only by the necessity of paying back the dowry received with the wife. The people are a quiet and pacific race, kind and hospitable to strangers, though naturally distrustful of foreigners. They are friendly toward each other, and the ties of kindred are cherished with much affection. The internal commerce of the islands is considerable, for each atoll has its peculiar branch of industry; in one the brewers reside, in another the goldsmiths; locksmiths, mat makers, potters, turners, and joiners, each inhabit exclusively their respective atolls. This division of labor gives rise to a constant intercourse and interchange of commodities, carried on by means of boats, which are sometimes absent for a year from their own islands. Every family, even the poorest, has a boat, and the rich keep several. The multitude of rocks and reefs is so great that this navigation is extremely difficult, and much property is lost by accidents at sea; but the natives being universally good swimmers, their lives are seldom endangered by these shipwrecks. There is some trade with the continent of India, carried on by native boats of about 80 tons burden, built of cocoanut trees. With these boats they make voyages to Calcutta and other distant parts, carrying cocoanuts and cowries or small shells, which pass as coin over all India. They also take for sale ropes made from the husk of the cocoanut, and oil extracted from the fruit itself, and also quantities of dried fish. In return they bring home gold and silver, rice, tobacco, cotton and silk goods, and European articles.—The Maldives have been seldom visited by Europeans. In the beginning of the 17th century a French merchant vessel was wrecked upon them, and one of the survivors, M. François Pyrard de Laval, remained there nearly 5 years, and wrote an account of the islands, which was published in Paris in 1679.

MALEBRANCHE, NICOLAS, a French metaphysician, born in Paris in 1638, died there, Oct. 13, 1715. In his childhood he was physically feeble, and was educated at home with great care. Intended for the priesthood, he studied philosophy at the college of La Marche and theology at the Sorbonne, and in 1660 entered the congregation of the Oratory. He wearied, however, of theological and critical studies, and his philosophical vocation was determined by reading the *Tractatus de Homine* of Descartes, which he accidentally met with, and which impressed him so strongly that his perusal was more than once interrupted by palpitations of the heart. From that time (1664) he devoted himself to philosophy, renouncing all other sciences except mathematics, aiming thus to enlighten his mind

without burdening his memory. After 10 years he produced his principal work, *De la recherche de la vérité* (Paris, 1674), which received numerous additions, and in its 6th edition (1712) extended to 4 volumes. Its extraordinary success was due to its beauty of style and admirable method, as well as to the originality and dignity of its doctrine. The abstractions of philosophy were treated with almost lyrical animation. "Poetry," said Fontenelle, "could not lend to philosophy more philosophical ornaments." In 1677 he published his *Conversations métaphysiques et Chrésiennes*, a discussion on the relation of philosophy to religion and Christian dogmas, which involved him in a long controversy with theologians and Cartesian metaphysicians, especially with Arnauld and Régis. In 1699 he was elected an honorary member of the academy of sciences. Withering slowly away, till he was hardly more than a skeleton, he died "a tranquil spectator of his own long dissolution." His later more important publications, partly philosophical and partly religious, were the *Traité de la nature et de la grâce* (Amsterdam, 1680); *Méditations métaphysiques et Chrésiennes* (Cologne, 1683); *Traité de morale* (1684); *Entretiens sur la métaphysique et sur la religion* (1688); and *Réponses de Malebranche à Arnauld* (4 vols., 1709). A complete edition of his works was published at Paris in 1712, in 11 vols.—The following characterization and criticism of the philosophy of Malebranche is abridged from Kuno Fischer's *Geschichte der neuern Philosophie*. His central and peculiar idea is that human knowledge is a divine act, or, as he himself expresses it, that we see all things in God. On Cartesian principles he regarded matter and spirit, the extended and the thinking substance, as utterly opposed and mutually impermeable. Matter is unknown to mind, which is limited to pure self-consciousness. The mind is thus like a person in the dark, who can truly perceive nothing but himself. The formula that we see objects only in the light symbolizes the Malebranchian vision of all things in God. The idea of God thus becomes nearer and more comprehensive than in the Cartesian system. He no longer as an innate idea merely occupies a mathematical point in the soul, acting beside as a *Deus ex machina* behind the scenes of the world; but he is the absolute substance, in whom exist alike the persons who know and the things which are known by representative ideas. He is the home of spirits and the world of ideas, as space is the place of physical bodies. The mathematical point in the system of Descartes thus gains its periphery in that of Malebranche. The human mind can of itself neither conceive the idea of extension nor engender the knowledge of things, for the reason that all its powers extend only to modifications of thought. Neither the senses, nor the imagination, nor the reason can at the command of the will create ideas of objects. These ideas cannot come to us from material objects, for the mind

is impenetrable to matter; they cannot be born within us, for the soul of itself knows nothing at all about outward things. They therefore, as Malebranche concludes, are divine and not human ideas; they exist in God, who is the universal reason and light that illumines every soul. We know only in God. We know the soul immediately by consciousness; we know material things by means of ideas, as the eye sees colors by means of the light; we know God by immediate vision, as the eye sees the light. As the soul finds its ideas of objects only in God, so it tends of itself toward God, who is the principle both of its knowledge and its will; it aims to unite itself most intimately with God; and in this devotion to the absolute consists the method of attaining to truth. There is throughout the philosophy of Malebranche a tendency to reduce the 8 substances—the thinking, the extended, and the infinite substance, or the soul, matter, and God—to a single substance; but he adheres too strictly to the metaphysics of Descartes to grasp this unity. In Descartes, these 8 substances describe eccentric circles, having no common centre; in Malebranche, they form concentric spheres, not excluding each other, as in Cartesianism, but including each other. Matter is grasped by the soul, and souls by the Deity. Ideas enter the mind, the mind itself existing in God. While in his principles Malebranche thus accepts this Cartesian trinity, in his tendency he renounces it, and in the tone of his statements aims to abolish the dualism of spirit and matter in the one infinite substance which they form. He tends toward Spinoza, and his system marks the transition from Cartesianism to Spinozism. The spirit of his philosophy is to identify all substances in the infinite substance or God, and to represent God as the universal reason, the impersonal and absolute essence both of the soul and of matter. This pantheistic kernel is, however, hidden beneath orthodoxy and Cartesianism, which mask rather than veil the philosophy of Malebranche. In his principles he recognizes the antagonism of the Cartesian dualism, and the dogma of a personal God; in his tendency he reduces spirit and matter to one absolute substance, which he even calls their universal reason; in his principles he recognizes the creator and the created, in his tendency only substance and law; in the former he is dualistic and theistic, in the latter he is pantheistic.—His most important works are contained in the edition by De Genoude (Paris, 1837).

MALESHERBES, CHRÉTIEN GUILLAUME DE LAMOIGNON DE, a French statesman, the last counsel to Louis XVI., born in Paris, Dec. 6, 1721, guillotined April 22, 1794. Of an illustrious family, son of the chancellor of France, he was educated in the Jesuits' college, became counsellor of the parliament of Paris in 1745, succeeded his father in the presidency of the court of aids in 1750, and was at the same time appointed superintendent of the press. He favored the publication of the *Encyclopédie* and

other works of the same authors in defiance of the anathemas of the Sorbonne, and to his facility in this respect La Harpe and others attributed the excesses of the French revolution. He protested in 1770 and 1771 against the imposition of new taxes and the abuses of *lettres de cachet*, for which he was banished from Paris. On the accession of Louis XVI. in 1774, he was called into the ministry with Turgot, and the department of Paris and the police of the kingdom was intrusted to him. His counsels were rejected, and he resigned in 1776 when Turgot was dismissed. He passed the time until the revolution in travels in France, Holland, and Switzerland, and in the pursuits of literature, with the exception of a brief interval in 1787 when he was called into the ministry. When Louis XVI. was arraigned before the national convention in 1792, Malesherbes obtained the dangerous honor of pleading his cause, and was one of the last to take leave of the condemned monarch. Eleven months afterward he was arrested with his family by the revolutionary tribunal, and condemned with them to the scaffold. He was a member of the French academy, and also of those of sciences and inscriptions, and wrote several memoirs on topics of rural economy and natural history. His *Discours et rémontrances* (1809) are valuable with reference to financial questions, and his paper *Sur la liberté de la presse* (1809) is remarkable for its enlightened views. A monument was erected to his memory under the restoration.—See Boissy d'Anglas, *Essai sur la vie, les opinions et les écrits de Malesherbes* (2 vols., 1818).

MALHERBE, FRANÇOIS DE, a French poet, born in Caen in 1555, died in Paris in 1628. While young he studied at Heidelberg and Basel, and afterward bore arms in the wars of the league. He acquired some reputation in 1600 by an ode on the arrival in France of Maria de' Medici. In 1605, having gone to Paris on business, Henry IV. sent for him, praised his talents, and provided him with the means of remaining at court. After the death of Henry IV. his widow, Maria de' Medici, settled on Malherbe a pension of 500 crowns, "in gratitude for the ode addressed to her." He was noted for his avarice, his contempt of his own art and of poets, his fondness for female society, and his wit. He had a delicate ear and a refined taste, and, being regarded at court as the oracle of elegant language, assumed such an authority as to be called "the tyrant of words and syllables." When dying, his confessor, in speaking of the happiness in heaven, expressed himself inaccurately. "Say no more about it," said Malherbe, "or your style will disgust me with it." He is esteemed as one of the first among the second class of French poets. He is however more remarkable for successfulness of expression and for choice of language than for original thought. He wrote for the most part light lyrics, odes, stanzas, epigrams, sonnets, and a few devotional pieces.

He also published some translations from Seneca and Livy. The latest edition of his works is that of Pavele (2 vols., Paris, 1825).

MALIBRAN, MARIA FELIOTA, a celebrated singer, born in Paris, March 24, 1808, died in Manchester, England, Sept. 23, 1836. She was the eldest daughter of the well known singer and instructor, Manuel Garcia, by whom she was taken in early childhood to England, where she remained for a number of years. Her father personally instructed her in singing, and by her 17th year she had acquired so great a facility that on June 7, 1825, she was enabled to make her début in London as Rosina, in the *Barbiere di Siviglia*, on the occasion of the sudden departure of Mme. Pasta, who was to have undertaken the part. She sang with success in other operas and at private and public concerts during the same season, giving promise, notwithstanding many marks of youth and inexperience, of great future eminence; and in the autumn of 1825 she accompanied her father to the United States as prima donna of an opera company of which he had assumed the direction. She appeared before a New York audience on Nov. 29, in the part of Rosina, the occasion being memorable in the musical annals of the country as that which witnessed the inauguration of the Italian opera in the United States. Her reception was of the most enthusiastic character, and she appeared successively in a number of parts, each of which subsequently became a perfect creation in her hands. In the midst of her triumphs she was married in March, 1826, to M. Malibran, a French merchant of New York, reputed to be possessed of considerable wealth. He soon after failed, and Mme. Malibran, offended by the readiness with which her husband sought to retrieve his fortunes by her professional labors, surrendered to his creditors the property settled upon her as a marriage dower, and returned alone to Europe. From May 8, 1827, when she made her first appearance before a Parisian audience, until the close of her life, her career was in the highest degree prosperous and brilliant, and her popularity never waned. She was accustomed to spend the winter in Paris and the spring and autumn in England and the larger continental cities; and on two occasions she made professional tours to Naples, Milan, and other Italian cities, where the enthusiasm with which she was received bordered on the wildest extravagance. The French court having in 1835 pronounced her marriage with M. Malibran void, she was married in the succeeding spring to De Bériot, the celebrated violinist. Soon after she was injured by a fall from her horse; but professing to make light of the matter, she went to the Manchester musical festival in the summer, and, contrary to the advice of her physician, took part in the performances. A nervous fever set in, which, in her enfeebled state of health, soon proved fatal.—Mme. Malibran was confessedly one of the first singers of the age, and her dramatic ability was scarcely less remarkable than

her vocal. Her voice, a mezzo soprano approaching a contralto, of great volume and purity, had been brought to almost absolute perfection by the severe training of her father; and in the variety and beauty of her vocal embellishments, as well as in the felicity and dramatic propriety with which she interpreted her music, she has rarely been equalled. Her range included some of the finest rôles, both tragic and comic, in the operas of Rossini, Bellini, and Mozart, including those of Rosina, Semiramide, Tancredi, Desdemona, Romeo, Zerlina, Ninetta, Cenerentola, and Amina, which will long remain identified with her name. She also sang with wonderful effect the sublime music of Handel's oratorios, and many choice selections from Gluck and others. Her personal qualities accorded with her lyric genius, and few women have been more beloved for their amiability, generosity, and professional enthusiasm. Her benefactions amounted to such considerable sums that her friends were frequently obliged to interfere for the purpose of regulating her finances, her heart, as Lablache was accustomed to say, being too big for her little body. Her intellect was of a high order, and the charms of her conversation fascinated all who were admitted into the circle of her intimate friends. She was also an accomplished linguist, speaking fluently and singing in the chief languages of Europe. A memoir of her, in 2 volumes, by the countess of Merlin, appeared in England soon after her death, and was republished in the United States.

MALLARD. See DUCK.

MALLARY, ROLLIN CARLOS, an American lawyer and statesman, born in Cheshire, Conn., May 27, 1784, died in Baltimore, Md., April 15, 1881. He was graduated at Middlebury college in 1805, and held the office of state's attorney of Rutland co., Vt., during the years 1811-'12-'18, and subsequently in 1816. He was elected to congress in 1819, and was 6 times successively reelected. He was a zealous advocate of the protective system; in the 20th congress he was chairman of the committee on manufactures, and reported the tariff of 1828, and by his exertions contributed much to secure its passage.—CHARLES D., D.D., an American clergyman, brother of the preceding, born in Poultney, Vt., in Jan. 1801. He was graduated at Middlebury in 1821, and in 1822 removed to Columbia, S. C., where he was ordained to the ministry of the Baptist church and preached 6 years. He has since resided in Georgia. He was one of the principal founders of Mercer university, and perhaps did more than any other by personal effort to raise its endowment fund. In the great division of the Baptist denomination which took place about 1835 on the missionary question, he was an advocate of the missionary system. His principal works are a "Life of Mercer," and "Soul-Prosperity."

MALLET, DAVID, a Scottish author, born in Crieff, Perthshire, about 1702, died in London, April 21, 1765. His original name was Malloch. Having studied at Aberdeen, he was en-

gaged as tutor to the children of a gentleman of Edinburgh, from whose service he entered the family of the duke of Montrose, whose two sons he accompanied to Winchester, and afterward attended during their travels on the continent. Returning to England, he settled in London as a literary man, and by the favor of his patron obtained access to the best society of the capital. The poets Thomson and Pope were among his friends. In 1728 his best known poem, the ballad of "William and Margaret," appeared in No. 86 of the "Plain Dealer." In 1738 he published a poem entitled "Verbal Criticism," which so pleased Pope that he introduced him to Bolingbroke, who obtained for him the office of under secretary to Frederic, prince of Wales, with a salary of £200. He wrote political essays in defence of the Newcastle and Bute administrations, from the former of which he got a pension, and from the latter a situation in the customs. The pension is said to have been the reward of his attacks on the unfortunate Admiral Byng. His pen was always at the service of those who would pay for it, not sparing even his old friend Pope, whom after his death, at the instigation of Bolingbroke, he assailed in his preface to that nobleman's "Idea of a Patriot King." For this servility Bolingbroke made him his literary executor. The duchess of Marlborough left by her will the sum of £1,000 to Glover and Mallet jointly, provided they drew up from the family papers a life of the great duke. The task was burdened with several onerous conditions; Glover declined, but Mallet accepted it, and on pretence of being engaged upon the work received for the rest of his life a pension from the second duke. On his death, however, it was found that he had never written a line of it. His most important works, beside those already mentioned, are the poems of "The Excursion" (1728) and "The Hermit" (1747); 8 tragedies played at Drury Lane, "Eurydice" (1731), "Mustapha" (1739), and "Elvira" (1763); "The Masque of Alfred" (in conjunction with Thomson, 1740); and a "Life of Lord Bacon" prefixed to an edition of the philosopher's works (1740). A collection of Mallet's works was published by himself in 1759 (8 vols. 8vo.).

MALLET, PAUL HENRI, a Swiss historian and antiquary, born in Geneva in 1780, died there, Feb. 8, 1807. After completing his education he went to Copenhagen, where he was appointed regius professor of belles-lettres in 1782. He employed his leisure in studying the language, history, and archaeology of the ancient Scandinavians, and wrote his *Introduction à l'histoire de Danemark* (Copenhagen, 1785-'6). In 1760 Mallet returned to Geneva, and filled the chair of history in the college of that city for 4 years. The most important of his works, beside that above named, are: *Histoire de Danemark* (8 vols. 4to., Copenhagen, 1758-'77); *Mémoires sur la littérature du nord* (6 vols. 8vo., Copenhagen, 1759-'60); *Histoire des Suisses* (4 vols. 8vo., Geneva, 1808); and *Histoire de la ligue Hanseatique* (Geneva, 1805).

His *Introduction à l'histoire de Danemark* was translated into English by Bishop Percy, under the title of "Mallet's Northern Antiquities" (2 vols. 8vo., London, 1770; new ed., by I. A. Blackwell, 1 vol. 12mo., 1847).

MALLOUF, NASSIF, a Syrian linguist, born at Zabouga, on Mt. Lebanon, in March, 1828. He was educated in a convent on Mt. Lebanon. His mother tongue was Arabic, and to this he soon added Persian and Turkish. He learned the principal European languages at a missionary school in Smyrna, and was in 1845 appointed professor of oriental tongues in the Lazarist college of the propaganda in that city. It was there that he composed the greater part of his numerous works, including the *Liçani turkîsin anakhtaridir*, or "Key of the Turkish Language" (Smyrna, 1848); *Plaisanteries de Nasr Eddin Khodja*, with the Turkish text (Smyrna, 1849; Paris, 1856); and several grammars, dictionaries, and elementary works in French, with their Persian, Arabic, and Turkish correlatives. During the Crimean war Mallof was the first secretary-interpreter of Lord Raglan, and was officially employed to teach Turkish to the English officers.

MALLOW, a common European plant, described by Pliny under the name of *malva*, and known to Theophrastus as *μαλαχῆ* (from *μαλασσειν*, to soften, in allusion to its softening and emollient properties). The term *malva* is used generically by modern botanists, and embraces a great number of species found in all parts of the world. The genus is likewise the type of the natural order *malvaceæ*, which comprises many kindred genera distinguishable mainly in the structural differences of the fruit. According to Lindley, the mallowworts form $\frac{1}{15}$ of the flowering plants of Sicily, $\frac{1}{12}$ of those of temperate North America, and in the equinoctial parts of the same continent $\frac{1}{4}$. It is remarkable that none of the order possess any unwholesome qualities, while all abound in mucilage. The wild mallow (*M. sylvestris*, Linn.) is a handsome plant, with an erect stem and kidney-shaped leaves having 7 deeply crenate lobes; the flowers are large, of a purple or a rosy color, the calyx hairy, the carpels with reticulate-rugose seeds. It grows spontaneously on waste places and roadsides in Britain, and has been known as an introduced and naturalized weed in America. For certain applications, such as fomentations and poultices, its properties are not inferior in value to those of the marsh mallow (see *ALTHÆA*), and decoctions of its leaves have been used in dysentery. By far the most common with us is the familiar weed known as common mallow (*M. rotundifolia*, Linn.), so abundant by the wayside, in rich shaded door-yards, and near compost heaps. Its stems are short, simple, spreading widely around, and springing from a long, deeply buried root; its leaves are of a handsome, round, heart-shaped form, somewhat lobed and crenate on their edges; the flowers small, whitish, violet-white, or purplish. The plant is much prized by chil-

dren, who in play seek its flat and circularly disposed mucilaginous seeds under the name of "cheeses;" and by some the plant is known as cheese mallow. The musk mallow (*M. moschata*, Linn.) is also a native of Europe, but with us often cultivated in the garden, for which its handsome, deeply cut leaves, diffusing a pleasant, musky fragrance, and its large rose-colored flowers, render it suitable. The curl-leaved mallow (*M. crispa*, Linn.) is likewise seen in old gardens, conspicuous for its large, strong, tall stem, and rich, deep green, singularly curled foliage, the beauty of which supplies the defect of its flowers, which are rather inconspicuous. The bark of this species, according to Cavanilles, is sufficiently tenacious to be used in making cordage.—There are many very showy flowers belonging to the order *malvaceæ*, such as those of *Lavatera*, *malope*, *abutilon*, *sida*, &c., sought for and prized in open border and greenhouse cultivation. The raw cotton of commerce is the hairy covering of the seeds of malvaceous plants. The okra is the pod of *hibiscus esculentus*. The fibre known in India as *sun* is from the bark of *H. cannabinus*, and is a substitute for hemp. The root of *sida lanceolata* is intensely bitter, and is considered a valuable stomachic. A species of mallow (*M. tricuspidata*) is used in the West Indies as a substitute for soap. Dyes as well as medicines are likewise to be found among this extensive order of the mallow plants.

MALMESBURY, JAMES HARRIS, first earl of, an English diplomatist, born in Salisbury, April 21, 1746, died in London, Nov. 20, 1820. He was the eldest son of James Harris, secretary and comptroller to Queen Charlotte, and author of "Hermes," studied at Oxford and Leyden, and through the patronage of his father's colleague and friend, Lord Shelburne, was appointed in 1767 secretary of legation at Madrid, and afterward as *chargé d'affaires* brought to a successful issue the negotiations with the Spanish government in regard to the Falkland islands. Subsequently he officiated for 4 years as English ambassador in Berlin, and from 1777 to 1784 in St. Petersburg. In the house of commons, of which he had been a member since 1770, notwithstanding his absence, he was a follower of Mr. Fox, after whose withdrawal from the cabinet he received from Mr. Pitt the appointment of ambassador at the Hague, which the former had designed for him. While at the Hague he negotiated (1788) important treaties with Holland and Prussia, and in Sept. 1788, was raised to the peerage as Baron Malmesbury, having been knighted in 1780. After his return to England he continued to act with the whig party until 1793, when with other friends of Mr. Fox he joined the party of Mr. Pitt, who again appointed him to a mission to Berlin. In 1794 he negotiated the marriage between the prince of Wales and Caroline of Brunswick, and accompanied the bride to England. His "Diaries and Correspondence," edited by his grandson (4 vols. 8vo., London, 1844) abounds in par-

ticulars of this unhappy alliance, and in other interesting matters relating to his times. In 1796 and 1797 he was employed without result in negotiations for peace with the French republic. Becoming deaf, he spent the rest of his life in retirement. In 1800 he was created Viscount Fitzharris and earl of Malmesbury.—JAMES HOWARD HARRIS, 8d earl of, grandson of the preceding, born March 25, 1807, studied at Eton and Oxford, and entered parliament as member for Wilton in 1841; but by the death of his father (Sept. 10, 1841) he was almost immediately translated to the house of lords. He officiated in Lord Derby's cabinet as secretary for foreign affairs from Feb. till Dec. 1852. He was personally acquainted with the emperor of the French, and advocated a conciliatory policy toward him, which contributed to cement the alliance of the two nations in the Crimean war. He was again secretary for foreign affairs from Feb. 26, 1858, till July 5, 1859, when he was succeeded by Lord John Russell.

MALMESBURY, WILLIAM OF, an English historian, born in Somersetshire about 1095, died in Malmesbury, Wiltshire, about 1150. He was destined for the church, and early entered the monastery of Malmesbury, of which he became librarian and precentor. He was the author of various valuable works, 8 of which were published by Sir Henry Saville in 1596, in his *Scriptores post Bedam*. His "History of the Kings of England" and "Modern History" (*De Gestis Regum* and *Historia Novella*), translated by the Rev. John Sharpe (London, 1815), were reprinted in 1847 in Bohn's "Antiquarian Library."

MALMÖ, a seaport town of Sweden, capital of a laen or district of the same name on the sound, 16 m. E. S. E. from Copenhagen; pop. 10,203. It was formerly well fortified, but its defences have been demolished. The principal part of the town is built around a large square, shaded by lime, alder, and chestnut trees. The churches, theatre, and governor's house are the principal edifices. The chief trade is in grain and brandy, and there are manufactures of gloves. Armistices were signed here between the Danes and Prussians, Aug. 26, 1848, and July 10, 1849.

MALMSEY, a sweet luscious wine, made from a species of grape originally brought from a small town on the southern coast of the Morea called Monembasia. The French call the place Malvoisie, and the wine *vin de Malvoisie*, of which the English term Malmsey is a corruption. The best Malmsey wine is said to be made on Mt. Ida in Candia. But the Malmsey wine of commerce is produced in Madeira, the Canary islands, the Azores, in Sicily, and in the south of France. It is made from grapes grown on rocky ground, exposed fully to the sun, and left to hang on the vines a month later than the grapes used for dry wines. They are not gathered until partially withered. The story that the duke of Clarence, the brother of Edward IV. of England, when condemned to death for treason in 1478, was drowned at his

own request in a butt of Malmsey wine, has no authority but common rumor at the period. Nothing is known of his death except that he died or was executed while a prisoner in the tower of London.

MALONE, EDMOND, an Irish author and critic, born in Dublin, Oct. 4, 1741, died in London, May 25, 1812. He was graduated at Trinity college, Dublin, went to London, and was called to the bar in 1767; but having inherited a considerable fortune, he abandoned the profession of the law, and devoted himself to literature. In 1780 he published two supplementary volumes to Steevens's edition of Shakespeare, and in 1790 his own edition of the great dramatist appeared in 11 vols. 8vo. In 1796 he exposed the Shakespearian forgeries of Samuel Ireland. At his death he left a greatly improved edition of his Shakespeare, which was published in 1821, under the supervision of his friend James Boswell, in 21 vols. 8vo. His other principal editorial labors are: "The Prose Works of John Dryden, with a Memoir;" "The Works of William Gerald Hamilton, with a Sketch of his Life;" and "The Works of Sir Joshua Reynolds."—See "Life of Edmond Malone, with Selections from his Manuscript Anecdotes," by Sir James Prior (8vo., London, 1860).

MALPIGHI, MARCELLO, an Italian anatomist, born near Bologna in 1628, died in Rome, Nov. 29, 1694. In 1656 he was appointed by Frederic II. of Tuscany professor of medicine at Pisa, where he made the acquaintance of the celebrated mathematician Borelli, who first convinced him of the propriety of applying experimental researches to the elucidation of physical science. Ill health, however, soon compelled his return to Bologna, where he continued to practise as a physician till 1666, when he was called to a professorship at Messina. In 1691 he was invited to Rome by Innocent XII., who appointed him his chief physician and chamberlain. Malpighi devoted much attention to the anatomy and physiology of plants and animals, and was the first who investigated accurately the structure of the skin and of the secreting glands. Two editions of his works were published in London in 1686 and 1697.

MALPLAQUET, a village in France, department of Nord, about 10 m. S. from Mons, celebrated for a sanguinary battle between the allied forces under the duke of Marlborough and Prince Eugene, and the French under Marshal Villars, Sept. 11, 1709. The allies, after the capture of Tournay, having advanced upon Mons, the capital of Hainaut, Villars, with a view of obstructing them in the siege of this place, took up a strong position near Malplaquet, having his centre on a rising ground, with intrenchments in front, and his wings protected by dense woods. Marlborough, finding that the prosecution of the siege would be impracticable with so formidable an enemy in his rear, determined, notwithstanding Villars' advantage of position, to risk an engagement. The battle commenced at 8 o'clock in the morn-

ing, the principal attack of the allies being directed upon the enemy's left, where Villars himself held command. The French at first repelled their assailants, but Villars having become disabled by a wound which obliged him to retire from the field, the allies succeeded in forcing the position. The French right, however, commanded by Marshal Boufflers, drove back in disorder the Dutch infantry opposed to them. Boufflers, seeing the centre seriously menaced, then placed himself at the head of the king's household troops, and by a vigorous charge cleared the trenches of the allies. The latter soon returned to the assault, and an obstinate conflict was long maintained in this part of the field, in the course of which the chevalier St. George, son of James II., made 12 desperate charges at the head of the French cavalry. The allies were meanwhile making rapid progress on the left wing, and also on the right, where, through the negligence of the general left in command by Boufflers, the prince of Orange had regained all the advantages lost by him in the early part of the day. Under these circumstances nothing was left to Boufflers, now the chief in command, but to draw off his forces, which was done in good order, the allies not being in a condition to pursue them. In this battle, the bloodiest in the war of the Spanish succession, the allies, who brought into the field 80,000 men and 140 guns, lost in killed and wounded more than 20,000 men; the French, who numbered 70,000 men with 80 guns, lost about half that number; but some accounts place the loss on both sides as high as 42,000. It was the least brilliant of Marlborough's great victories, as it was the last gained by him in the open field, and he has been accused of rashness and a useless sacrifice of lives in attacking Villars. He seems, however, to have had no other alternative than to offer battle or to raise the siege of Mons, the surrender of which city was the fruit of his victory. During the battle Marlborough exposed his person to frequent perils, and the report of his death, which was at one time prevalent in the French ranks, gave rise to the once popular military refrain: *Malbrook s'en va l'en guerre*, which is reproduced from an old song of the 16th century on the death of the duke of Guise.

MALT. See BREWING.

MALTA (anc. *Melita*), a British possession in the Mediterranean, including the islands of Malta, Gozo, and Comino, and the uninhabited islands of Corminetto and Filfla, the entire group lying between lat. 35° 43' and 36° 5' N. and long. 14° 10' and 14° 35' E., about 60 m. S. S. W. from Cape Passaro, the southernmost point of Sicily, and 200 m. N. from Tripoli in Africa; area, 115 sq. m.; pop. in 1856, 142,587, and of Malta proper about 100,000, including nearly 5,000 English and 3,000 other foreigners, the remainder being natives of Malta. The island of Malta is of an irregular oval shape. The substratum consists of soft calcareous sandstone only thinly covered with soil, much of which

has been carried thither from other countries, chiefly from Sicily, and brought under cultivation by the natives, who are remarkable for their bodily strength and energy. There are neither lakes nor rivers in the island, and no forests or brushwood; the verdure is scanty, and most of the surface is an arid rock exposed to the winds blowing from the African deserts. Malta is excessively hot in summer, day and night. The sirocco prevails especially in autumn, and there is little if any land or sea breeze to modify the temperature. Feelings of lassitude are created in summer, but the climate is not considered more insalubrious than in other parts of S. Europe, and during the winter months it is positively delightful. The atmosphere of Malta is so clear that at all times of the year the summit of Mt. Etna may be distinctly seen during the rising or setting of the sun, although at a distance of 180 m. The E. portion of the island contains all the towns and villages, and is separated by a ridge from the W. part, which, although thinly settled, is well cultivated and abounds with the wild thyme and other odoriferous plants, attracting bees, which furnish the excellent Maltese honey. The amount of land under crops in 1855 was 82,505 acres in Malta and 10,688 in Gozo, chiefly in wheat, cotton, and mixed grain. The uncultivated land comprises 14,000 acres. The live stock in 1855 included 4,249 horses, mules, and asses, 4,897 horned cattle, 7,889 sheep, and 2,895 goats. The value of imports in 1855 was £331,429, and of exports £1,093,331; entrances, 3,640 vessels, tonnage 624,945; clearances, 3,544, tonnage 621,021; registered shipping, 200 vessels, tonnage 30,000. The shipping employed in the trade with Great Britain in 1858 comprised 37 vessels outward, tonnage 3,270; and 42 steamers and 208 vessels inward, tonnage 89,177. The direct trade with the United States is not considerable, the exports in 1859 amounting to about \$50,000; but a large number of American ships are engaged in the trade of foreign countries with Malta. Cotton is the staple product of the island, and gives rise to an extensive manufacture of cotton goods. The cabinet work of Malta enjoys a high reputation. Soap, leather, macaroni, and iron bedsteads are manufactured to some extent. The goldsmiths are noted for their elegant workmanship, and the Maltese artisans in other branches are also generally able and intelligent. They are excellent seamen, and their services are in great demand in the Mediterranean. But the bulk of the people are either employed in agricultural labor or in stone-cutting.—The Maltese are derived from an Arabic stock; it is probable, however, that the Arab conquerors have been mixed up with the previous Punic population. Greek is supposed to have been in ancient times the medium of conversation of the higher classes, as Italian and English are at the present day. The present common language of the people is a *patois* of the Arabic, mixed with Italian. The complexion of the Maltese is al-

most as dark as that of the natives of Barbary. The dress of the working classes is a short loose waistcoat, covering a cotton shirt, short loose trousers, woollen caps in winter and straw hats in summer, and a kind of sandals (*korcha*) resembling those of the ancient Romans. The women are of dark complexion, and are small, delicate, and generally graceful, and wear in the streets a black veil (*faldetta*). The dress consists mostly of a cotton shift, blue striped petticoat, a corset with sleeves, and a loose jacket covering the whole. Drunkenness is almost unknown, and the people, although perhaps less refined in their appearance, are less vindictive and passionate than other races of southern Europe. They are remarkably fond of poetry, especially in the rural districts, where the taste for improvisation prevails extensively. In music they prefer noisy instruments, as the tambourine, mandoline, and particularly the bagpipe, which accompany the national dances. They marry at an early age. Many of them seek employment in Barbary, Egypt, Syria, Turkey, and other countries. The families ennobled by the knights of Malta have dwindled down to a small number; and the few which remain are not possessed of large property. The national religion is Roman Catholic, under the direction of a bishop and over 1,000 priests, the church property being considerable. The number of Protestants is about 5,000, whose places of worship consist only of a few chapels. Education is promoted by the university of Valetta, by 88 public schools, in 1855 attended by 4,643 pupils (2,525 males and 2,118 females), and by 185 private schools, scattered over the various towns and villages. The principal normal free schools are at Valetta, Senglea, Notabile, and Rabato. The colonial and military authorities and the principal charitable and public institutions are at Valetta.—Malta is a crown colony, the local government being conducted by a governor who is at the same time commander-in-chief (in 1860, Major-General Sir John Gaspard Le Marchant), who is assisted in legislative matters by a council of 7 persons, including the Roman Catholic bishop, the officer second in command, the chief justice, and chief secretary, with 8 unofficial members appointed by the governor. The principal branches of public affairs are the chief secretary's office, quarantine, custom house, land revenue and audit office, and numerous courts of justice. The average annual amount of the public receipts and expenditures respectively is £125,000. The military and naval stations at Malta cost the home government in 1857 £442,722. The garrison consists of about 10,000 men, beside a native regiment comprising 500 men, called the Malta fencibles, the duties of which are exclusively local, and whose maintenance is defrayed out of the revenues of the island. The central position, military strength, and excellent harbor, one of the most commodious and convenient in the Mediterranean, render the possession of Malta of great importance to Britain, and invest

it with admirable advantages for the accommodation and repair of the men-of-war and merchant ships frequenting the Mediterranean. The storehouses or *caricatori* for grain are, like those of Barbary and Sicily, excavated in the rock, making Malta an excellent centre of the corn trade between the Mediterranean and Black seas. The English steamers from and to England, the Ionian islands, Egypt, &c., touch at Malta, and the French steamers between Marseilles, Alexandria, and other parts of the Levant, perform quarantine there.—Beside Valetta and Citta Vecchia, and a few other towns, Malta possesses about 40 casals or hamlets, chiefly remarkable for their picturesque churches. It is separated by a channel from the adjoining island of Gozo, the capital of which is Rabato. The former capital of Malta was Citta Vecchia. The present capital, Valetta, is one of the best fortified places in the world, and serves as a rendezvous for the Mediterranean fleet.—The ancient Melita was important as a commercial station among the nations of antiquity, and it was occupied probably at a very early period by a Phœnician colony. Afterward it became a Carthaginian settlement. At a later period it appears to have been in a measure Hellenized, though there is no historical evidence of its having been in the possession of the Greeks. In 257 B. C. it was ravaged by a Roman fleet under Atilius Regulus; and surrendering to the Romans in 218, it was annexed to the province of Sicily. It became notorious as a resort of the Cilician pirates, but was in a flourishing condition in the days of Cicero, who during periods of disturbance entertained the project of retiring thither. The Maltese cotton fabrics (*vestis Melitensis*) were in great demand in Rome, and they were probably manufactured from the cotton which still forms the principal product of the island. In sacred history Malta is celebrated as the scene of the shipwreck of St. Paul on his voyage to Italy (A. D. 60); though according to some critics Melita in the Adriatic, on the coast of Dalmatia, was more probably the island visited by the apostle. After the fall of the Roman empire the island was for some time in the possession of the Vandals, but was taken from them by Belisarius (A. D. 533), and was subject to the Byzantine empire until the end of the 9th century, when it was conquered by the Arabs. The latter were expelled at the beginning of the 12th century by the Norman conqueror of Sicily, Count Roger, and it was united with Sicily until the early part of the 16th century, when Charles V. took possession of that country and of Malta as heir of Aragon. Under this emperor the knights of Malta (see SAINT JOHN, KNIGHTS OF) became its sovereigns, and held it until 1798, when the French expedition to Egypt under Napoleon seized the island. After the battle of the Nile the inhabitants rose in insurrection and compelled the French to shut themselves up in the fortress of Valetta. They were subjected to a stringent blockade until Sept. 5, 1800, when, reduced by famine,

they surrendered to the English, who had come to the assistance of the Maltese. The island has since remained under the rule of Great Britain.

MALTBY, EDWARD, D.D., an English prelate, born in Norwich in 1770. While young he was the favorite pupil of the celebrated Dr. Parr at Norwich school. He studied at Pembroke college, received in 1806 the degree of D.D., and after exercising sacerdotal functions in Huntingdonshire became chaplain to the Bishop of Lincoln. He was consecrated bishop of Chichester in 1831, and transferred to Durham in 1836, which he resigned in 1856. He is the author of several volumes of sermons, an edition of Morell's *Lexicon Græco-Proseodiacum*, and a Greek Gradus (8vo., 2d ed., London, 1840).

MALTE-BRUN, CONRAD, properly **MALTHE-BRUNN**, a French geographer, born in Thisted, Jutland, Aug. 12, 1775, died in Paris, Dec. 14, 1826. He was educated at the university of Copenhagen. On the outbreak of the French revolution, he incurred the hostility of the Danish government by his republican principles, and had to withdraw to the island of Huen. After an exile of two years he was permitted to return to Copenhagen; but in 1800, having a second time given offence to the government, he went to Hamburg, and thence to Paris, thinking that his political views would render him acceptable to the first consul. In this anticipation, however, he was disappointed; and abjuring politics, he turned his attention to geography. In conjunction with Mentelle, a popular French geographer, he published in 1803-'5, 2 vols. 8vo., his *Géographie mathématique, physique et politique*. In 1808 he commenced the publication of a periodical entitled *Annales de voyages*, in which an account is given of the various contemporary discoveries in the science of geography. In 1810 appeared the 1st volume of his *Précis de la géographie universelle*. This work was not completed till 1825, and comprises 8 vols. 8vo. (new ed., 1852-'5). Malte-Brun was also the author of various political works and poems. There are English translations of his physical and general geography. Editions of the latter, with additions and corrections by James G. Percival, were published at Boston and Philadelphia (3 vols. 4to. and 6 vols. 8vo., 1828-'32). His *Mémoires scientifiques et littéraires* were published by Nachez in Paris in 1828.—**VICTOR ADOLPHE**, son of the preceding, born in Paris in 1816, is at the present day one of the most prominent geographers of France. He is secretary of the geographical society of Paris, and one of the editors of the *Bulletin* issued by that institution. He is also editor-in-chief of the *Nouvelles annales des voyages*, and is the author of *Les jeunes voyageurs en France*, and, in concert with several others, of *La France illustrée* (1855-'7). He has published a new edition of his father's geography, and in 1858 he also published a *Résumé historique* of Dr. Vogel's travels in Africa.

MALTHUS, THOMAS ROBERT, an English political economist, born in Albury, Surrey,

in 1766, died in Bath, Dec. 29, 1834. His father was a gentleman of fortune, interested in classical and philosophical studies, and so intimate a friend of J. J. Rousseau that he was appointed one of his executors. Robert received his early education under private tuition, his principal instructors being the Rev. R. Graves, author of the "Spiritual Quixote," and the versatile and controversial Gilbert Wakefield. In 1784 he was admitted to Jesus college, Cambridge, became one of the first classical scholars, obtained prizes for declamation, and was 9th wrangler on taking the degree of bachelor in 1788. He received his master's degree and a fellowship in 1797, entered holy orders, and divided his time between the care of a small parish in Surrey and the prosecution of his studies in Cambridge. In 1798 he published anonymously the first edition of his work on population, which was subsequently much enlarged and modified. The title of the 6th and last revision (1826) is: an "Essay on the Principle of Population, or a View of its past and present Effects on Human Happiness, with an Inquiry into our Prospects respecting the future Removal or Mitigation of the Evils which it occasions." His object at first was to refute the theory of human perfectibility and political optimism, advanced by Condorcet and Godwin, by showing the necessary sufferings of the poor from the tendency of population to increase faster than the means of subsistence. The state and prospects of the poor became the prominent feature and occupied the principal portion of the subsequent editions. He travelled in 1799 through Sweden, Norway, Finland, and a part of Russia, making researches and collecting facts and documents in illustration of his subject; and during the interval of peace in 1802 he explored France and Switzerland. He married in 1805, and was appointed to the professorship of history and political economy in the East India college at Haileybury, the duties of which he fulfilled till his death. His other principal writings are: "Observations on the Effects of the Corn Laws" (3d ed., 1815); an "Inquiry into the Nature and Progress of Rent" (1815); "Principles of Political Economy" (1820); and "Definitions in Political Economy" (1827).—His reputation rests almost exclusively upon the views advanced in his work on population. His first proposition is that population, when unchecked, increases in a geometrical ratio, while food can be made to increase at furthest only in an arithmetical ratio. By geometrical progression the population would be doubled in every generation, and in 500 years would increase to more than a million times its present numbers; but in the most favorable circumstances, the produce of a country could hardly be uniformly and permanently increased to 20 times its amount every 500 years, which, however, would be only arithmetical progression as compared with the geometrical increase of inhabitants. From these two different rates of increase it results

that powerful checks on population must be constantly in action. These checks are divided into the positive and the preventive, the former including all the causes which tend in any way to shorten human life, the latter including on the one hand abstinence from marriage and sexual intercourse from prudential considerations, and on the other the general corruption of morals which tends to render women unprolific. These checks may be resolved into vice, misery, and moral or prudential restraint. Promiscuous intercourse and improper acts to conceal the consequences of illicit connections fall under the head of vice. Unwholesome occupations, severe labor, bad and insufficient food, excesses, exposure, and neglect of children fall under the head of misery. The moral restraint from indulgence and the prudential restraint from marriage he admits to have operated with comparatively inconsiderable force formerly, but maintains that their prevalence is the means by which modern Europe has superseded, to some extent, the more violently penal forms by which vice and misery were formerly repressed. "An infrequency of the marriage union, from the fear of a family, is the most powerful of the checks which in modern Europe keeps down the population to the level of the means of subsistence." The delay of marriage or abstinence from it through life is a deduction from the sum of human happiness, but is a vastly less evil than results from the positive checks. Malthus was one of the founders of the political economy club and of the statistical society, was a member of the most eminent literary and scientific societies of Europe, was a friend and frequent correspondent of Ricardo, and was highly esteemed for personal amiability and disinterestedness.

MALUS, ÉTIENNE LOUIS, a French physicist and military engineer, born in Paris, June 28, 1775, died there, Feb. 28, 1812. At the age of 17 he entered the *école du génie militaire*; but when about to obtain a commission as an officer, he was dismissed from the school by an order from the ministry, on the ground probably that his father, who held a post in the treasury office, was a suspected person. He forthwith entered the army as a private soldier, but was soon withdrawn from the ranks, and selected as one of the pupils of the new polytechnic school, the director of which, Gaspard Monge, placed him in a class of 20 who were to instruct the others. For 8 years he prosecuted his studies with great ardor, giving particular attention to the mathematical theory of optics, and to the properties of light. Upon leaving the school he received a captain's commission in the corps of engineers, and served during the campaign of 1797 with the army of the Sambre and Meuse. Subsequently he participated in the whole campaign in Egypt, and in 1804 he superintended the construction of fortifications at Antwerp and Strasbourg. During the remainder of his life, whatever time could be spared from his professional labors was devoted

to scientific pursuits. His chief publications consist of a mathematical *Traité d'optique*, first published in the *Mémoires présentés à l'institut* in 1810, in which he promulgated some valuable discoveries respecting the refraction of light in transparent media; and of a paper in the *Mémoires d'Arcueil* (1809), and the "Theory of Double Refraction" (*Mémoires présentés à l'institut*, vol. ii.), containing an account of his discoveries respecting the polarization of light, which consisted in showing that light may acquire properties identical with either of two rays yielded by refraction through Iceland spar by the process of simple reflection at a particular angle from any transparent body. This discovery gained for its author his election to the institute and the biennial medal of the royal society of London. He also published an "Essay on the Measurement of the Refractive Force of Opaque Bodies;" "Remarks on some new Optical Phenomena," intended to prove that two portions of light are always polarized together in opposite directions; a paper "On Phenomena accompanying Refraction and Reflection," and one "On the Axis of Refraction of Crystals."

MALVOISIN, or MAWMOISINE, WILLIAM DE, a Scottish ecclesiastic, died July 9, 1238. He was educated and perhaps born in France. In 1199 he became chancellor of Scotland, and in 1200 bishop of Glasgow. In 1202 he resigned the chancellorship, and was translated to the see of St. Andrew's. In 1211, as papal legate, in concert with the bishop of Glasgow, he assembled a council of the clergy and people at Perth, to consider the pope's mandate for an expedition to the Holy Land. In 1214 he officiated at the coronation of Alexander II., and in 1215 appeared at the 4th Lateran council as one of the representatives of the Scottish church. He was a zealous churchman, and, according to Fordun, was equally zealous in support of his personal rights, having deprived the abbey of Dunfermline of the presentation to two livings because its monks had once neglected to provide him with wine for supper. He wrote the lives of St. Ninian and Kentigern.

MALWAH, or CENTRAL INDIA, an old province of Hindostan, comprising a table-land from 1,500 to 2,500 feet above the level of the sea, bounded N. E. by the valley of the Ganges, E. by Bundelcund, S. by the Vindhya chain, and N. W. by the Aravulli mountains, and lying chiefly between lat. 22° and 23° N. and long. 74° and 77° E.; length about 220 m., average breadth 150 m.; the people are mostly Hindus. It is now divided into a number of native states under British protection, and includes part of the possessions of Sindia and Holkar. The surface is uneven, with a gradual descent northward from the Vindhya mountains. It is watered by many rivers, the chief of which is the Chumbul, an affluent of the Ganges. The soil is fertile, producing cotton, tobacco, opium, indigo, sugar, and grain, and affording pasture for large numbers of sheep and cattle. The

rivers are not navigable, but a considerable overland trade is carried on in cottons, printed cloths, opium, and other products of the country. The principal towns are Oojein, Indore, Bhopal, Bilsah, Seronge, Mundessor, Burseah, and Mundoo.—Malwah became tributary to the emperors of Delhi in the 18th century, but subsequently threw off the yoke, and for 180 years formed a powerful independent kingdom. It was then conquered by Akbar, and on the dissolution of the Mogul empire was overrun by the Mahrattas, under whose turbulent occupation it was desolated by those predatory gangs called Pindarrees, whose suppression constituted one of the best measures of Lord Hastings's administration. A police force of Bheels was subsequently organized by the British, and for some time proved highly efficient, but a large portion of it mutinied in 1857.

MAME, ALFRED HENRI ARMAND, a French printer, born in Tours, Aug. 17, 1811. In 1833 the printing establishment founded by his father in Tours came into his possession, in partnership with his cousin Ernest Mame, who since 1851 has been mayor of Tours. The cousins, who are also brothers-in-law, extended the business in common till 1845, when it came under the sole direction of Alfred Mame, who raised it to the greatest importance. The establishment now includes departments for printing, binding, bookselling, and editorial and other business, with all the requisite accessories for each, all the processes of bookmaking, from the first to the last, being completed within its limits. The machinery moved by steam, employed in the printing department, is capable of producing 15,000 volumes per day. On every work day about 5,000 lbs. of books, stitched or bound, are sent forth, which are received into galleries capable of containing 2,000,000 volumes. There are 700 persons employed within, and about 500 outside of the establishment. The special publications of the house of Mame are liturgical and devotional works, or small books for religious education, printed under the auspices of the archbishop of Tours; and also editions of the classics, and elementary treatises on science and education, issued likewise under ecclesiastical authority. Its small prayer books (*Paroissiens*), bound in leather and with gilt edges, are sold at retail for 85 centimes (8½ cents), so great is the economy resulting from the extensive scale on which they are produced. The house of Mame received prizes for specimen publications from the great exhibition in London in 1851, and in Paris in 1855.

MAMELUKES (Arabic, *memalik*, a slave), a body of soldiery who ruled Egypt for several centuries. They were introduced into that country by the sultan Es-Salih about the middle of the 18th century, and were composed originally of Asiatic youths purchased from Gen-
tles Khan, whose captives they were. They were called the Bahree Mamelukes, or Mamelukes of the river, because they were first lodged and trained on an island in the Nile. They

formed the body guard of the sultan. Tooran Shah, the son and successor of Es-Salih, becoming unpopular, the Mamelukes deposed and murdered him about 1250, and raised their commander Eybek to the throne. A line of sultans known as the Bahree or Turkish dynasty now followed, all of whom were raised to power by the Mamelukes, and many of them deposed and slain. A new band of Mamelukes, however, had been created by these sovereigns, composed of Circassians and Georgians, who were called Borghees, which signifies of a tower or castle, from the fact that they were first employed to garrison the fortresses of Egypt. In 1387 the Borghee Mamelukes gained the ascendancy over the Bahrees, and made their commander Barkook sultan. The Borghees continued to rule the country till 1517, when they were subdued by the Ottoman Turks, and Egypt became a dependency of Constantinople. The Turkish sultan did not deprive the Mamelukes of all power. He divided Egypt into 24 provinces, each of which was placed under the jurisdiction of a Mameluke bey or chief. This body served as a check upon the pasha to whom the general government was intrusted. The beys also had the right to elect the *sheik-el-belled* or governor of Cairo, an officer of great power. "A more unjust and absurd constitution," remarks Gibbon, "cannot be devised, than that which condemns the natives of a country to perpetual servitude under the arbitrary dominion of strangers and slaves. Yet such has been the state of Egypt above 500 years. The most illustrious sultans of the Baharite and Borghite dynasties were themselves promoted from the Tartar and Circassian bands; and the four and twenty beys or military chiefs have ever been succeeded, not by their sons, but by their servants." The number of the Mamelukes was about 12,000, and they were nearly all from the region between the Black sea and the Caspian, whence they were brought in their youth to Cairo, compelled or persuaded to embrace Mohammedanism, and educated as soldiers. They did not intermarry with the natives of Egypt, but bought wives of their own race from the traders in Circassian slaves. These women from the north seldom bore children in Egypt, or if they did their offspring was sickly and did not long survive. Though instances of hereditary succession among the Mamelukes were not unknown, they were comparatively rare, and the transmission of power and wealth was almost universally from master to slave, and not from father to son. It was asserted by Volney that when he visited Egypt in the latter part of the last century, there was not a single Mameluke family of the second generation: "All the children perish in the first or second descent." The Mameluke beys, soon after the Turkish conquest, contrived to obtain such influence in the country, that eventually they became the virtual rulers of Egypt, while the viceroys of the sultan had only the shadow of power. Each of the 24 beys maintained 500 or 600 followers,

magnificently armed and equipped, and forming the finest body of cavalry in the world. Each of the 12,000 Mamelukes was attended by two armed slaves who fought on foot. In 1798, when Napoleon invaded Egypt, his army first encountered the Mamelukes while on the march from Alexandria to Cairo. "The whole plain was covered with Mamelukes," says Scott, "mounted on the finest Arabian horses, and armed with pistols, carabines, and blunderbusses of the best English workmanship—their plummed turbans waving in the air, and their rich dresses and arms glittering in the sun. Entertaining a high contempt for the French force, as consisting almost entirely of infantry, this splendid barbaric chivalry watched every opportunity for charging them, nor did a single straggler escape the unrelenting edge of their sabres. Their charge was almost as swift as the wind, and as their severe bits enabled them to halt or wheel their horses at full gallop, their retreat was as rapid as their advance. Even the practised veterans of Italy were at first embarrassed by this new mode of fighting, and lost several men; especially when fatigue caused any one to fall out of the ranks, in which case his fate became certain. But they were soon reconciled to fighting the Mamelukes when they discovered that each of these horsemen carried about him his fortune, and that it not uncommonly amounted to considerable sums in gold." At the battle of the Pyramids, July 21, 1798, the Mamelukes mustered their full force and attacked the French with desperate courage. Seven thousand of them, under command of Murad Bey, charged the French squares with matchless intrepidity, dashing their horses against the bayonets and throwing their pistols at the heads of their enemies. They were repulsed with terrible slaughter, and their broken and dispirited remnants, about 2,500 in number, fled into Upper Egypt. "Could I have united the Mameluke horse to the French infantry," said Napoleon, "I would have reckoned myself master of the world." After the French were driven from Egypt by the British, the Mamelukes regained in some degree their power, and a civil war broke out between them and the Turks. They were twice subjected to treacherous massacres, but their final destruction as a political and military body was accomplished on March 1, 1811, when the pasha, Mehemet Ali, beguiled their chiefs to the number of 470 into the citadel of Cairo by professions of friendship and on pretence of celebrating a festival, and then closed the gates and ordered his Albanian soldiers to fire upon them. Only one escaped, a bey who leaped his horse from the ramparts and alighted uninjured, though the animal was killed by the fall. Immediately after a general massacre of the Mamelukes in every province of Egypt was ordered. The few who escaped fled to Nubia and to Sennaar, where they built the town of New Dongola and attempted to keep up their force by disciplining negroes in

their peculiar tactics. They did not succeed, however, and a few years later their number was reduced to about 100, when they dispersed, and the Mamelukes ceased to exist as an organized body.

MAMIANI, TERENCE DELLA ROVERE, count, an Italian statesman and author, born in Pesaro, Papal States, in 1799. In 1831 he took an active part at Bologna in the revolutionary movement which followed the accession of Gregory XVI. to the holy see, and after its immediate suppression by force of arms he fled, and lived in Paris, engaged in literary and patriotic labors, until the amnesty granted on the accession of Pius IX. (1846) permitted him to return to Rome. He took a foremost position among the liberal statesmen who gathered round the new pope, and was even induced to accept a seat in the cabinet. The vacillating policy of Pius IX., however, soon led to his retirement, and he went to Turin, where in concert with Gioberti and other eminent men he founded the "Italian Confederation," of which association he became president. In Nov. 1848, after the assassination of Rossi and the flight of the pope, he returned to Rome, where he took charge of the department of foreign affairs, Rosmini being among his colleagues. His attempts to secure the predominance of moderate liberal ideas over the radicalism of Mazzini failed, and he retired from the administration in December. A few months afterward, as member of the Roman constituent assembly, he opposed the proclamation of the republic and the deposition of the pope, and withdrew from public affairs as soon as the republic was established. He continued, however, to reside in Rome, but strenuously resisted the overtures made to him by Mazzini, and denounced his policy as fatal to Italian nationality. After the French intervention in Rome he retired to Genoa, where he has since resided. In 1856 he was chosen a member of the Sardinian chamber of deputies, and became a zealous champion of the policy of the king of Sardinia and of Count Cavour, in whose administration he now (1860) occupies the position of minister of instruction. The principal merit of Mamiani as a philosopher consists in having shown the paramount importance of the question of method in philosophical researches. This he established on the principles of the Scotch philosophers combined with those of the eclectic school of France; a method whose origin he traces to the Italian philosophers of the 15th century. Later in his "Confessions of a Metaphysician," undertaking to resolve the highest problems of ontological philosophy, he has shown himself a strenuous defender of realism. As a poet, a scholar, a philosopher, an orator, and a statesman, Mamiani occupies a high place in the contemporary history of Italy. His principal works are: *Del rinnovamento della filosofia antica Italiana* (1836); *Poeti dell'età media* (1842), a collection of classical poetry; *Dell'ontologia e del metodo*, and *Dialoghi di scienza prima*

(1848); *Principi della filosofia del diritto*; and a number of other treatises on metaphysical, ethical, political, and politico-economical subjects. A complete edition of his poetical works was published by M. Lemonnier (Florence, 1857). An English translation of his "Rights of Nations," edited by Roger Acton, has been published (London, 1860).

MAMMALIA, the highest vertebrated animals, including man, warm-blooded, breathing by lungs separated from the abdominal cavity by a diaphragm, generally covered with hair, and bringing forth their young alive, which they nourish by the secretion of mammary glands (whence their name). Most mammals are commonly known as quadrupeds, from their having 4 feet suited for progression on a solid surface; but the terms are not synonymous, as most reptiles are 4-footed, and the whales cannot be called quadrupeds. The form of mammals is very various; among them we see man walking erect, the flying bats, the swimming cetaceans, the bulky elephant, the slow-moving sloth, and the agile squirrel; yet the 3 regions of head, neck, and trunk can always be recognized in the skeleton, and generally in the living animal. The neck, though varying in length from that of man ($\frac{1}{4}$ of the spinal column) to that of the giraffe ($\frac{3}{4}$), with 2 or 3 exceptions consists of 7 vertebræ; some of the sloths have 8 or 9, and some manatees are said to have 6 only; in the hoofed animals the length of the neck depends on that of the fore legs, for the purpose of grazing; but the elephant has a long proboscis to compensate for the shortness of the neck rendered necessary by the ponderous head; the extra vertebræ of the sloths are by some considered as dorsals with rudimentary ribs to give additional mobility to the neck. The number of dorsal vertebræ varies from 11 in some of the bats to 22 in some of the sloths, man having 12; the lumbar vertebræ, 5 in man, are 2 in the ornithorhynchus and 9 in some lemurs, stronger than the dorsals, and without ribs, which are replaced by long transverse processes; the sacral vertebræ, usually 4, vary from 1 to 9; the rudimentary tail of man, the *os coccygia*, consists of 4 bones, but in the long-tailed manis there are 46 caudal vertebræ. The skull is articulated to the spine by 2 occipital condyles, which permit the upward and downward motions of the head, the lateral and rotating movements depending on the articulation between the 1st and 2d vertebræ; in whales the short neck is immovable as in fishes, and its bones are very thin and more or less consolidated together; the strong *ligamentum nucha*, which supports the head, is attached to the spinous processes and skull. The caudal vertebræ are of 2 kinds, one having a spinal canal, the other not, and the processes are always developed in accordance with the use made of the tail; in most mammals its movements are confined to brushing away insects from the skin, but in the kangaroo it forms with the hind legs a firm tripod from which the animal

springs, and in some South American monkeys it is prehensile and used as a 5th hand in hanging from trees; in the whales it becomes a powerful swimming organ, is provided on its under surface with V-shaped bones for the protection of the blood vessels, and, being horizontal, is used principally as an organ by which to rise to the surface to breathe; in the beaver the transverse processes and the lower spinous are very large for the attachment of the muscles which move the tail like a trowel chiefly in a downward direction. The bones of the spine are united by elastic fibro-cartilages; these, in whales, form osseous disks, separating on maceration, and frequently used by arctic travelers for plates.—As all mammals breathe air, the mechanism of their respiration depends on the movable ribs and the diaphragm; man has 7 true and 5 false ribs, the former united to the sternum, the latter not; the number is in proportion to that of the dorsal vertebræ; in the whale, of 12 ribs, 11 are false, in the man 11 out of 23, in the horse 8 out of 18, in the cat 4 out of 13, and in the manatee 14 out of 16; in the carnivora they are dense and narrow, in the herbivora large, broad, and thick. The breast bone varies in shape according to the presence or absence of clavicles; in non-clavicated animals the chest is compressed laterally, and the breast bone has a projecting keel as in birds; in bats it is much keeled, in the higher apes flat as in man, and in the moles it extends in front of the ribs, forming a distinct piece; in animals with clavicles the chest approaches very nearly to that of man; the human chest, however, is the only one in which the transverse exceeds the antero-posterior diameter, causing the greater separation of the shoulders and the increased facility of movement of the arms. The anterior ribs always extend as far as the breast bone, and are thus true ribs, differing in this respect from those of birds. Each of the ribs is usually connected by its head to an articular cavity formed by the bodies of 2 vertebræ, and by its tubercle to the transverse process of the posterior of the two; in the monotremata they are connected with the body alone, and in cetaceans often only with the transverse processes. The breast bone consists of several pieces, one behind the other, to which the anterior or true ribs are joined by cartilages which rarely become ossified; the posterior are the false or floating ribs, and are not attached immediately to the breast bone; this arrangement gives mobility to the chest, and allows the elevation and depression of the ribs during respiration. The bones of the skull and face are immovably connected with each other, a character which does not occur in any of the lower classes; the brain cavity is larger than in birds and reptiles; the occipital condyles, near the centre of the base in man, are gradually removed to the posterior portion as we descend in the scale; the number of cranial bones, 8 in man, is less than in most lower vertebrates. For the general characters see **COMPARATIVE ANATOMY**, where also are given

sufficient details on the organs of sense, teeth, digestive system, and hairy covering. The lower jaw consists of 2 pieces, and is alone movable; in man it is susceptible of motion up and down, laterally, and from before backward; in the carnivora the 1st movement, in the ruminants the 2d, and in the rodents the 3d, is specially provided for by the shape of the condyles and the form of the glenoid cavity.—The limbs of mammals vary exceedingly in shape, according to the offices to be performed by them; we find the wonderful hand of man with its thumb opposable to the fingers, the 4 hands of the monkey, the paddles of the whale, the walking feet of the horse, the wing of the bat, the powerful paw of the lion, the shovel of the mole, all constructed on the same type and modified from the same bony elements. The anterior limbs are always present, with a well developed scapular arch, usually kept in place by a clavicle; this last is present in man, monkeys, the insectivora, squirrels, and bats, but absent in cetaceans, the hoofed animals, and some edentates; in most carnivora and in some rodents it is imperfectly developed; it corresponds to the furcular bone in birds, and the monotremata have in addition the 2d or coracoid clavicle of birds. The shoulder blade is thin, flat, and more or less triangular, generally with a well marked spine; it is long and narrow in herbivora, and placed perpendicularly on the anterior and lateral portion of the chest; in carnivora and rodents, requiring more freedom of motion, it is oblique, and so of course is the glenoid cavity; jockeys are well aware that an upright shoulder is the mark of a stumbling horse. The arm bone is nearly straight in man, much bent in the carnivora, long in monkeys and sloths, and short in ruminants and cetaceans; it is connected by a ball and socket joint with the scapula; below it articulates with the radius and ulna of the forearm by a hinge joint. The ulna is the longest in man and lies on the inside, and receives the arm bone in a deep sigmoid cavity; the radius is connected with the wrist, and turns with the movements of the hands, rolling around and upon the ulna; this independence of movement becomes less and less, according as the limbs are more used as instruments of progression; in the carnivora and rodents the two bones are distinct, but the rotation is very imperfect, and in the hoofed animals generally the two make a single bone; the radius seems to form the principal bone, the ulna being frequently, as in the horse and bats, very rudimentary. The wrist in man consists of 8 bones in 2 rows, in other mammals varying from 5 to 11; to these are attached the 5 parallel metacarpal bones in man, followed by the 5 fingers, each having 3 joints, except the 1st or thumb, which has only 2; in the ruminants the 2 metacarpals form the single cannon bone, sometimes with rudimentary bones on the side, as the splint bones of the horse; most pachyderms have 3 metacarpals, the elephant having 5. In animals which walk on the ends of the toes, the

metacarpus is so lengthened that it has been mistaken for the forearm, and supposed therefore to be flexed in an opposite direction to that of man; but the lower part of the fore leg of a horse, for instance, is in reality the metacarpus, and the part called the knee is the wrist joint. The fingers vary from 1 to 5; the 3d or middle finger is the most constant, and commonly the longest, and is the only one found in the horse; the thumb disappears first, then the little finger, and then the 4th finger; ruminants have the 2d and 3d, or fore and middle fingers. The hind limbs are more firmly connected to the trunk than the anterior; the supporting arch is the pelvis, composed of the ilium, ischium, and pubis on each side, the 1st joining the sacrum, the 2d forming the prominences upon which man sits, and the 3d uniting in front; in cetaceans there is only a rudiment of this bony arch, and the hind limbs are absent. The thigh bone, the longest in man, is in most other mammals relatively shorter; it is attached by a ball and socket joint to the pelvis, in man its axis being nearly that of the body, but in the lower mammals bending more and more forward until it forms an acute angle with the trunk. The tibia and fibula correspond to the radius and ulna of the forearm, and have the patella or knee-pan in front of the articulation with the thigh bone; these are coalesced in various animals somewhat as are the radius and ulna; the tarsal bones correspond to the carpal, and are followed in the same manner by the metatarsus and toes. In the apes the great toe is opposable to the others, like the thumb, whence they are called *quadrumana*, 4-handed; while man rests his whole foot, from the heel to the toes, on the ground, other mammals walk chiefly on the toes; the horse stands on the tips of the middle fingers and toes, the heel being nearly as high up as the knee in man, the cat on the last 2 joints of several toes, and the bear on the metatarsus and toes; there is no animal, except man, that can be properly said to touch the ground with the entire foot; in the seals all the bones of the leg and foot may be recognized, but they are united by a membranous web into a kind of caudal fin. The bones of mammals have not the air cells found in birds, but are either solid or their cavities are filled with an oily matter called marrow; there are, however, air cavities called sinuses, especially large in the frontal bone of ruminants, as in the ox and sheep, and greatly developed in the frontal region of the elephant; these communicate either with the nasal or auditory passages.—While most mammals resemble man in the arrangement of the muscles, others approach birds and even fishes in this respect; as they are less active than birds, their muscles are less firm and the tendons less liable to ossify; they are generally fewer in number than in man, and their variations from the human type are noticed chiefly in the limbs; in the mole, for instance, the flexors of the arm, the great pectoral, and the *latissimus dorsi* are very large; the herbiv-

ora and pachyderms require massive muscles, and the agile carnivora compact and energetic ones; the muscles of the ears are specially developed in the herbivora, and those of the nose in the hog; the *glutæus maximus*, the largest of all in man, is much smaller in the monkey, and very small in the lower mammals; the nates in the horse are composed principally of the *glutæus medius*; the muscles of the calf, so characteristic of man, are small in all below him, and the short muscles of the human hand are absent in the lower mammals; those of the wings in bats are arranged somewhat as in birds, and those of cetaceans as in fishes. The principal muscle remarkably developed in many mammals, but rudimentary in man, is the cutaneous layer, the *panniculus carnosus*, of which the human analogue is the *platysma myoides* of the sides of the neck and face; we notice its action in the horse when a fly or any irritating object touches the skin, in the erection of the quills of the porcupine, and in the coiling of the body of the armadillo. The minute coccygeal muscles of man are represented by numerous and powerful ones in the prehensile tail of certain monkeys, in the strong trowel of the beaver, and in the fluke of the whale, analogous to the human *multifidus spinae*.—In man and mammals the heart is composed of 2 distinct halves, each divided into 2 cavities, an auricle and a ventricle; the course of the blood is from the left ventricle to the aorta and over the body, pure arterial; then traversing the systemic capillaries it enters into the veins, and is carried to the right auricle; thence it passes to the right ventricle, and thence by the pulmonary artery to the lungs, in whose capillaries it becomes purified by the oxygen of the respired air, and is returned by the pulmonary veins to the left auricle, whence it enters the left ventricle to be distributed as before. Here, therefore, the blood passes twice through the heart and through 2 systems of capillaries before completing its circle; hence the circulation is called double, and it is also complete, as the whole mass of the blood is purified in the lungs before it is sent over the body. Before birth, when the lungs are impervious, the auricles communicate directly, and one or more vessels pass from the right ventricle to the aorta, conveying the blood over the body without sending it to the lungs; but when respiration begins the communications between the arterial and venous systems are closed. In the dugong the two ventricles are separated by a deep cleft; in some mammals the right auricle receives 3 venæ cavæ; the apex is not inclined to the left, as in man, except in some monkeys, and in some hoofed animals 2 small flat bones are imbedded in the substance of the left ventricle. In cetaceans there is a plexiform arrangement of the arteries of the walls of the chest, allowing an accumulation of blood in them, to be used as required during prolonged submersion; in many ruminants the internal carotid forms a *rete mirabile*, or network of vessels, at the entrance of the skull,

doubtless to prevent injury to the brain from too great force of the blood while the head is in a dependent position; in the slow-moving sloths the arteries of the limbs communicate very freely, rendering compression during their climbing impossible except in a few vessels at a time. A similar disposition prevails in the venous system; in the seal and otter, as in the ducks, the inferior cava is dilated into a receptacle which holds the blood while they are under water, and only permits it to pass on to the lungs when they come to the surface; in the porpoise tortuous sinuses receive the intercostal veins, and in the foot of the horse a fine network is distributed on the front of the coffin bone. The heart is composed of muscular fibres, each cavity having its own, arranged in a spiral manner from the point to the base; the course of the blood is directed from the auricles to the ventricles by the mitral valve on the left side and the tricuspid on the right, kept in place by tendinous cords attached to fleshy columns, and the entrances of the aorta and pulmonary artery are guarded each by 3 semilunar valves which prevent regurgitation. The lungs of mammals are almost always in pairs, and hang freely in the chest suspended by the straight windpipe, and enclosed within the serous cavity lined by the pleura; the air tubes are distributed to all their parts, and the pulmonary cells are minutely subdivided and do not communicate with any other air cells in the body as they do in birds. The windpipe varies much in length, in the number of its rings (which are from 14 to 78), and in their completeness; the cartilages do not generally form a complete circle, being membranous posteriorly, and in the whales the membranous portion is said to be in front. The mechanism of the mammalian respiration has been described under DIAPHRAGM, the muscular partition which separates the thoracic and abdominal cavities in this class.—The voice, under the control of the will, is produced by the passage of air from the lungs over certain organs in the larynx or upper portion of the windpipe; in man the larynx is a short and wide tube, suspended as it were from the hyoid bone, formed of cartilaginous plates, called the thyroid, cricoid, and 2 arytenoid cartilages; the prominence commonly called "Adam's apple" is the anterior surface of the thyroid cartilage. The mucous membrane forms 2 lateral folds from before backward, like the lips of a button hole, the vocal cords or ligaments; above these are 2 other folds, between which and the vocal cords is a cavity on each side, the ventricle of the larynx; the space between these 4 folds is the glottis, which is covered above, during the passage of food or drink, by a fibro-cartilaginous tongue, the epiglottis. In ordinary respiration the air passes noiselessly; but when the will contracts or otherwise modifies these cords, sound is produced, which in man becomes articulate speech by the action of the pharynx, nasal passages, and parts contained within the mouth. The epiglottis exists in all mammals, but it is

sometimes divided at the upper end; in cetaceans, the larynx ascends to the posterior nares and communicates with the blow-hole on the top of the head. The lion's loud roar depends on the great size of the larynx; the grunt of the hog is produced in cavities communicating with its ventricles; the neigh of the horse by vibrations of folds connected with the vocal cords; the bray of the ass by reverberation in a large cavity with small aperture under the thyroid cartilage; in the howling monkeys the hyoid bone is dilated into a bony pouch, and each ventricle opens into a large membranous sac, in which the loud sounds of these animals are produced; in the marsupials the voice is very weak.—The urinary system of mammals consists of secretory organs (the kidneys), and a reservoir for the secreted fluid (the bladder), communicating with the former by the ureters and externally by the urethra. The kidneys of mammals present the same external cortical and internal tubular portions as in man, and also the supra-renal capsules, in the lumbar region near the vertebrae and external to the peritoneal sac; they differ somewhat in form, being more or less lobulated, as in the human foetus, in cetaceans, seals, otters, bears, the elephant, and ox; the lobules vary from 10 in the otter to 180 in the seals, in cetaceans resembling a bunch of grapes; in all, except the monotremata, the ureters open into the bladder—in these into the urethra, as in chelonians. The bladder is generally more loosely connected in mammals than in man; it is largest in the herbivora, smaller and more muscular in carnivora and rodents. The chemical composition of the urine is about the same in carnivora as in man, except in the absence of uric acid; in the herbivora it is alkaline, containing hippuric acid and much earthy carbonate. In the stags, below the inner angle of the eye, there is an opening communicating with a large membranous pouch, from the glands of which is secreted a brownish liquid, flowing down the sides of the face, like tears; many animals have glands on the abdomen, in the groins, or about the genito-anal openings, whose secretion is very odorous, as in the musk deer, beaver, civet, and skunk.—The special internal male organs are the testes, which secrete the sperm, with certain accessory glands (as the prostate and Cowper's), and seminal receptacles or *reservoirs*; in the female the germs are formed in the ovaries, whence they escape through the Fallopian tubes into the uterus, and thence when full-grown externally; as the name mammal imports, they have also external glands for the secretion of milk, the *mammæ* or breasts. The testes may be permanently external, as in the dog—always abdominal, as in the seal, elephant, and cetaceans—or external during the rutting season, and at other times internal, as in the mole and porcupine. The epididymis is usually largely developed; the seminal vesicles are found in monkeys, bats, rodents, and pachyderms, but are wanting in carnivora, most plantigrades, ruminants, and marsupials; the prostate gland ex-

ists in some form in all mammals; the absence of Cowper's glands in most pachyderms, rodents, and carnivora, shows that their action is not essential to reproduction. The human ovaries are 2 oval, glandular bodies, about an inch long, in the posterior portion of the broad ligaments; each contains about 20 Graafian vesicles, enclosing an ovum. All the internal organs, except the uterus, are much alike in the other mammalia. This last organ, single in the monkeys, is in carnivora, many rodents, pachyderms, ruminants, and cetaceans, generally divided at the base into 2 horns (*cornua*), each sometimes having its distinct opening; in marsupials the ovaries are more or less racemose, as in birds. In most mammals, after the fecundated ovum has descended through the Fallopian tube (in the higher orders about the 12th day), an intimate vascular connection takes place between the sinuses of the parent and the chorion of the foetus, forming the placenta, which continues to supply the young with nutriment until it is capable of an independent existence. The period of utero-gestation, about 270 days in the human mammal, varies in the different families. This group of placental mammals has been called monodelphians to distinguish them from the didelphians, which include the marsupials and monotremata; the former have a more perfect brain, with its hemispheres united by a *corpus callosum*; the latter bring forth their young in a very imperfect condition, but have the brain destitute of a corpus callosum, the abdominal walls supported in front by 2 bones arising from the pubis, and an external pouch for the reception of the young. Prof. Jeffries Wyman ("Proceedings of the Boston Society of Natural History," vol. vi. p. 868), from the examination of a large number of foetal pigs, has shown that the above division of mammals into "placentals" and "implacentals" is not well defined; he found that in pigs there is, strictly speaking, no placenta, the maternal and foetal vessels being in relation only by means of very minute diffused villi and slight foldings of the chorion; this condition is intermediate between those of marsupials and ruminants, and shows such a gradual transition in this respect that the former must be brought nearer than has been usually admitted to ordinary mammalia. Mammary glands exist in both sexes, but serve for purposes of lactation only in the female; the number is generally in relation with the number of the young at a birth; there are 2 in monkeys, the elephant, the goat, and the horse; 4 in the cow, the stag, and the lion; 8 in the cat; 10 in the hog, rabbit, and rat; and 12 or 14 in the agouti. The position also varies; in monkeys and bats they are on the chest, in most carnivora on the chest and abdomen, and in the ruminants far back between the posterior limbs; in marsupials they are concealed within the abdominal pouch. Some mammals are born with the eyes open, and are at once able to run in search of food; many, however, are born

with the eyes closed and in a very weak condition; and a few, as the marsupials, leave the uterus in such an imperfect state that they would perish did not the parent place them in her pouch, where they complete their development, each suspended to a teat. In the monotremata (*ornithorhynchus*, &c.), which seem to form the connecting link between mammals and birds, in addition to the horny bill, cloaca, and bird-like ovaries, there are the form, external covering, skeleton, and milk-secreting glands of the mammals.—As to physical distribution, some mammals dwell entirely in the sea, as the cetaceans and most seals; some of the latter and the sirenoid pachyderms (manatee, &c.), live chiefly in fresh water; others, beavers, muskrats, the *ornithorhynchus*, &c., frequent rivers and lakes; but most live upon the land, some on mountains like the chamois and ibex, some on plains like the antelopes and bison, some on trees like the apes, squirrels, and sloths; others sail or fly in the air like the flying lemur and the bats, and others live under ground like the moles. For these different methods of progression and habits of life, the limbs are variously adapted by modifications of the same few osseous elements, evincing not only the wisdom and power of the Creator, but the existence of a divine plan according to which the mammalian as well as the other vertebrate classes have been developed. The study of fossil mammals shows that the same plan was followed in past geological ages, beneficently modifying animal organisms to suit the necessary functions and the changes in external conditions. Most naturalists have until recently believed that the appearance and existence of mammal and all animal and vegetable specific forms were due to special acts of creative power; but Mr. Darwin, in his remarkable work on the "Origin of Species" (1860), has maintained that the various forms of mammals (and he carries the argument throughout animated nature) have arisen by a process of natural selection and gradual improvement for countless ages from a comparatively few and perhaps a single mammalian type, itself possibly a development by similar stages from a primary animal monad. To what extent Mr. Darwin's theory may be true, the investigation and collection of many facts must hereafter determine; the present and past geographical distribution of mammals, the remarkable transition types in this and all classes, the authentic facts of natural and artificial effects of change, with the acknowledged imperfection of the geological record, show that the questions of origin and development can by no means be considered as settled beyond dispute. The study of the geographical distribution of mammals shows that the number of genera and species increases from the poles to the equator, with the exception of the whales and seals, which are most numerous in the polar regions; within the northern arctic circle there are species common to both hemispheres, as the arctic fox, white bear, reindeer, and ermine; in temperate North America the species are different from those of the east-

ern hemisphere, and in South America even the genera from those of the old world, as those including the peccary, llama, armadillo, ant-eater, sloth, cavy, agouti, vampire bat, marmoset, the howling and prehensile tailed monkeys; the raccoon and muskrat are exclusively American; the hog, horse, camel, rhinoceros, elephant, lion, tiger, lemurs, and anthropoid apes belong now to the eastern world; the giraffe, hippopotamus, chimpanzee, and most of the antelopes, are African; all the marsupials (except the American opossums) and the monotremata are Australian, while the stags, squirrels, cats, bears, dogs, and bats are absent from this region. The marsupials, though forming scarcely $\frac{1}{10}$ of the land animals in the world, constitute $\frac{1}{4}$ of the mammalian fauna of New Holland; exclusive of cetaceans and seals, the rodents form $\frac{1}{3}$ of the entire number of species of the world, the bats and carnivora $\frac{1}{3}$, the remaining third being chiefly the monkeys, ruminants, marsupials, and insectivora, according to Van der Hoeven; in Europe, wanting marsupials and monkeys, the rodents are $\frac{1}{3}$, bats $\frac{1}{10}$, and insectivora about $\frac{1}{10}$; in North America the species of rodents form perhaps half the entire number of land mammals; the large pachyderms, edentates, and the apes belong to the warm regions, most of the latter being African; the insectivora are almost peculiar to the northern hemisphere, and the lemurs are most common in the southern. The connection between animals and plants is well illustrated in the mammalian class; Mr. Darwin, in the 8d chapter of his work above alluded to, mentions the connection of the Scotch fir and grazing cattle, and of insect pests in Paraguay with the wild herds of cattle and horses; the introduction of a feline animal preying upon field mice, which in their turn devour the combs and nests of humblebees, would enable these insects freely to fertilize the tri-colored violet and the red clover in their visits to these flowers, and in this way a single cat in a district might greatly influence its vegetation. Excepting the whales and bats, mammals do not migrate, but spend the summer and winter in the same locality; the whales pass the summer in the polar regions, and come southward in winter into the lower Atlantic. The phenomena of hibernation or winter-sleep in mammals have been described under the former title.—MAMMALOGY includes the classification of mammalia. The mammalia were first separated from other 4-footed animals by Aristotle, who called them *zootoka* or viviparous animals; he divided them into 3 sections according to their locomotive organs: 1, *dipoda*, or bipeds; 2, *tetrapoda*, or quadrupeds; 3, *apoda*, impeds or whales. The quadrupeds, including all but man and the cetaceans, he subdivided into 2 great groups according to the modifications of the organs of touch, in the first of which the ends of the digits are left free for the sense of feeling, the nail being on the upper surface only, and in the second the feet ending in hoofs, corresponding respectively to the un-

guiculata and *ungulata* of Ray. The ungulates he divided by the teeth into 8 families: 1, those with cutting incisors and triturating or flattened molars, like the apes (*pithecoidea*) and the bats (*dermaptera*); 2, those with canine or carnivorous teeth, *carcharodonta* or *gampsonucha*; 3, those corresponding to the rodents, with the negative character of the absence of canine teeth. The ungulate or hoofed quadrupeds he divided, according to the organs of motion, into: 1, *polyschida* or multungulates, like the elephant; 2, *dischida* or bisulcates, including the ruminants (*merykizonta*) and the hogs; and 3, *aschida*, or solidungulates, like the horse. The apodal quadrupeds included the cetaceans or *ketoda*. It thus appears that Aristotle clearly perceived the principles upon which mammals are classified by the best modern naturalists.—This arrangement was not improved upon until John Ray published his *Synopsis* in 1693 in London, and his improvements relate to the 4-footed mammals. In his ungulate quadrupeds he places the solipedous (as the horse), the bisulcate ruminants (like the ox and stag) or non-ruminants (as the hog), and the quadrisulcate (rhinoceros and hippopotamus); in the ungulate the feet are either bifid (as in the camel), or multifid with digits adhering together (as in the elephant), with distinct depressed digits (as in apes), or compressed (as in carnivora, insectivora, rodentia, and edentates).—Linnaeus founded his primary divisions on the locomotive organs, deriving his orders from the modifications of the teeth; in his earlier editions of the *Systema Naturæ*, up to the 10th, he called the class *quadrupedia*, including the cetaceans among fishes; in his 12th edition (1766) he makes 7 orders, as follows: A. *Unguiculata*: I., *primates*, with 4 front cutting teeth, including man, the monkeys, and bats (4 genera); II., *bruta*, with no front teeth in either jaw, including the elephant, walrus, and edentates (6 genera); III., *fera*, with front teeth, conical and long canines, including the carnivora, opossum, and insectivora (10 genera); IV., *glires*, with 2 front cutting teeth in each jaw, including the rodents (6 genera). B. *Ungulata*: V., *pecora*, with cutting front teeth in the lower jaw, but none in the upper, including the ruminants (6 genera); VI., *bellua*, with obtuse front teeth in both jaws, including the pachyderms generally (4 genera). C. *Mutica*: VII., *ceta*, with horny or bony teeth, pectoral fins instead of feet, and horizontal flattened tail, including the cetaceans (4 genera). He thus made 40 genera in all. Linnaeus followed Ray in placing the elephant among the *unguiculata*, an error avoided by Aristotle.—Pallas divides mammalia into the following 7 orders: 1, *fera*, corresponding to the carnivora of later authors; 2, *semifera*, to the *primates* of Linnaeus, with the opossum and insectivora; 3, *glires*, or rodents; 4, *ruminantia*, the *pecora* of Linnaeus; 5, *anomalopoda*, the pachyderms exclusive of the proboscidiens; 6, *bellua*, the proboscidiens, exclusive of the walrus; and 7, *cetacea*, including whales, the man-

atee, and walrus. Klein in 1751 divided mammals into 2 orders, those which have the feet terminated by hoofs, and those which have claws or fingers. In 1756 Brisson made 18 orders and 42 genera. Erxleben in 1777 gave excellent descriptions of species, adding 10 genera to those of Linnaeus.—In 1798 Cuvier published his *Tableau élémentaire des animaux*, in which he laid down the basis of his classification, which was variously modified until the 2d edition of his *Règne animal* in 1829; in that work he makes the 9 following orders of mammalia: *bimana*, *quadrumana*, *carnivora*, *marsupialia*, *rodentia*, *edentata*, *pachydermata*, *ruminantia*, and *cetacea*. In his 1st edition the marsupials were ranked among carnivora, and in the *Tableau élémentaire* there were 3 grand divisions: I., *unguiculata*, with the orders *bimana*, *quadrumana*, *cheiroptera*, *plantigrada*, *carnivora*, *pedimana*, *rodentia*, *edentata*, and *tardigrada*; II., *ungulata*, with the orders *pachydermata*, *ruminantia*, and *solipeda*; and III., *mutica*, with the orders *amphibia* and *cetacea*.—The systems of Blumenbach, Illiger, and Desmarest differ little from that of Cuvier, except in the names of the orders and their subdivisions. Blumenbach in 1807 made the 9 orders of *bimana*, *quadrumana*, *cheiroptera*, *digitata*, *solidungula*, *bisulca*, *multungula*, *palmata*, and *cetacea*. Illiger in 1811 saw fit to change long established names for his 14 orders, with 40 families and 125 genera; his orders are: I., *erecta*, with the family of man; II., *pollicata*, with 5 families of apes, monkeys, lemurs, and most marsupials; III., *salientia*, with 2 families of the other marsupials, including the kangaroo; IV., *premsiculantia*, with 8 families of the rodents; V., *multungula*, with 6 families of the pachyderms; VI., *solidungula*, with the horse family; VII., *bisulca*, with 4 families of ruminants; VIII., *tardigrada*, with the sloth family; IX., *effodientia*, with 2 families of edentates; X., *repantia*, with the family of monotremata; XI., *volitantia*, with 2 families of flying lemurs and bats; XII., *falculata*, with 4 families of carnivora; XIII., *pinnipedia*, with the seal family; and XIV., *natantia*, with 2 families of herbivorous and carnivorous cetaceans. Desmarest in his *Mammalogie* (1820-'22) describes, exclusive of man, but with many fossil animals, about 850 mammals, of which the *quadrumana* are 141, the *cheiroptera* 97, the *fera* 176, the *marsupialia* 47, the *rodentia* 149, the *edentata* 24, the *pachydermata* 55, the *ruminantia* 97, and the *cetacea* 62; of these, 380 are herbivorous, 150 insectivorous, 240 carnivorous, and 80 omnivorous. De Blainville (1822) makes in the type *osteocaria*, or vertebrates, the sub-type *vitipara* and the class *pilifera* or *mammifera*, with the divisions *monadelphya* and *didelphya*. Temminck (1827) makes the 11 orders of man, monkeys, bats, carnivora, marsupials, rodents, edentates, pachyderms, ruminants, cetaceans, and monotremata. Fischer, in his *Synopsis Mammalium* (1829), makes the 9 orders of pri-

malas (man and monkeys), *chiroptera* (bats), *fera* (carnivora), *bestia* (insectivora and marsupials), *glires* (rodents), *bruta* (edentates and monotremata), *bellua* (pachyderms and solipeds), *pecora* (ruminants), and *cete* (herbivorous and ordinary cetaceans).—McLeay (1821), the founder of the quinary classification, makes 5 orders of mammals, which may be arranged in a tabular form as follows:

Mammalia.	Characters.	Birds.
1. <i>Fera</i> .	Carnivorous.	<i>Raptores</i> .
2. <i>Primatea</i> .	Omnivorous.	<i>Insectora</i> .
3. <i>Glires</i> .	Frugivorous.	<i>Rasores</i> .
4. <i>Ungulata</i> .	Frequenting the vicinity of water.	<i>Grallatores</i> .
5. <i>Cetacea</i> .	Aquatic.	<i>Natatores</i> .

This shows the analogies between mammals and birds, in regard to food and habits, which were afterward modified by Swainson (in 1835), as follows: I., typical group, *quadrumania*, organized for grasping, analogous to insessorial birds; II. sub-typical, *fera*, with retractile claws and carnivorous, to the *raptores*; III., aberrant group, including *cetacea*, eminently aquatic, with very short feet, to *natatores*; *glires*, with lengthened and pointed muzzle, to *grallatores*; and *ungulata*, with crests on the head, to *rasores*. He makes about 1,200 quadrupeds, which he arranges in these orders according to their natural affinities, thus: the order *quadrumania* includes the apes and monkeys and bats; the *fera* include the carnivora, opossums, insectivora, and seals; the *cetacea* are both herbivorous (manatee) and carnivorous (dolphins and whales); the *ungulata* comprise the pachyderms, edentates, ruminants, and solipeds; and the *glires* the rodents and herbivorous marsupials.—Oken in 1802 divided animals into 5 classes according to the organs of sense; this view is elaborated in his "Physiophilosophy" (Ray Society edition, 1847); of these 5 classes the 5th and highest is the *ophthalmozoa* or *mammalia*, so called because in them the eyes are movable and covered with 2 perfect lids, the other sense organs having however suffered no degradation; he also calls them *thricozoa* or *hairy animals* on account of their hairy covering, and *æsthetic* or *sensorial animals* from the completion and combination of all the organs of sense. They belong to his province of *sarcozoa* or *flesh animals*. His divisions are as follows: A. *Splanchno-thricozoa*. Order I., rodents, with the families: 1, infusorial *thricozoa* (rats); 2, polytary (squirrels); and 3, scalephan (hares). Order II., edentates and marsupials, with families: 4, mussel-like *thricozoa* (sloths); 5, snail-like herbivorous marsupials; and 6, kraken (carnivorous marsupials). Order III., insectivora and chiroptera, with families: 7, worm *thricozoa* (moles); 8, crustaceous (shrews); and 9, chiropteral (bats). B. *Sarco-thricozoa*. Order IV., *ungulata*, with families: 10, ichthyoid *thricozoa* (whales); 11, reptilian (pachyderms); and 12, ornithic (ruminants). C. *Æsthesio-thricozoa*. Order V., *unguiculata*, with families: 13, dermal *thricozoa* (carnaria); 14, lingual (seals); 15, nasal (bears), and 16, aural (apes); and 17,

ophthalmozoa or man, at the head of all. Every family of the *thricozoa* contains 5 genera, in accordance with the 5 organs of sense; the human family or genus has also 5 varieties on the same principle: 1, the skin man, the black African; 2, the tongue man, the brown Australian and Malay; 3, the nose man, the red American; 4, the ear man, the yellow Mongolian; and 5, the eye man, the white European.—Another philosophical system is that of Carus. The *mammalia* are made the 7th class of his 3d circle, the *cephalozoa*. He makes 10 orders, as follows: 1, *natantia*, or herbivorous and carnivorous cetaceans, with evident relations with fishes; 2, *reptantia*, or monotremata and edentates, related to reptiles; 3, *colitantia*, bats and flying lemurs, related to birds; 4, *mergentia*, seals and walrus, a repetition of the 1st; 5, *marsupialia*, a repetition of the 2d; 6, *glires* or rodents, a repetition of the 3d; 7, *pachydermata*, a 2d repetition of the 1st; 8, *ruminantia*, a 2d repetition of the 2d, indicated by the 5th, which is half ruminant; 9, *fera*, a 2d repetition of the 3d; and 10, *quadrumania*, having relations with man.—The fundamental idea of the classification of Fitzinger (1843) is the same as that of Oken, the class *mammalia* having 5 series, according to the development of the organs of sense, and each series 3 orders, viz.:

TOUCH.	TASTE.	SMELL.
<i>Cetacea</i> .	<i>Pachydermata</i> .	<i>Edentata</i> .
1. <i>Balanodea</i> .	1. <i>Phocina</i> .	1. <i>Monotremata</i> .
2. <i>Delphinodea</i> .	2. <i>Ovea</i> .	2. <i>Lipodonta</i> .
3. <i>Sirenia</i> .	3. <i>Ruminantia</i> .	3. <i>Tardigrada</i> .
HEARING.	VISION.	
<i>Unguiculata</i> .	<i>Primatea</i> .	
1. <i>Glires</i> .	1. <i>Chiropteri</i> .	
2. <i>Bruta</i> .	2. <i>Hemipithecii</i> .	
3. <i>Fera</i> .	3. <i>Anthropomorpha</i> .	

—Of the embryological systems of classification may be mentioned those of Von Baer, Van Beneden, and Vogt. Von Baer (1828) proposed the following division of this class of his doubly symmetrical or vertebrate type, with osseous skeleton, lungs, an allantois, and an umbilical cord: the cord may disappear early, 1, without connection with the mother (*monotremata*), or 2, after a short connection with the mother (*marsupialia*); or the cord may be longer persistent, 1, the yolk sac continuing to grow for a long time, the allantois growing little (*rodentia*), moderately (*insectivora*), or much (*carnivora*), or 2, the yolk sac increasing slightly, the allantois growing little and the umbilical cord very long (monkeys and man), continuing to grow for a long time and the placenta in simple masses (ruminants), or growing for a long time and the placenta spreading (pachyderms and cetaceans). According to Vogt (1851), mammals may be arranged in 3 divisions: I., *aplacentaria*, with the orders *monotremata* and *marsupialia*; and II., *placentaria*, with series 1, composed of the orders *cetacea*, *pachydermata*, *solidungula*, *ruminantia*, and *edentata*; series 2, of the orders *pinnipedia* and *carnivora*; and series 3, of the orders *insectivora*, *volitantia*, *glires*, *quadrumania*, and *bimana*. Van Beneden (1855), in

the class *mammalia* of his *hypocotyledones* or hypovitellians (vertebrates), in which the vitellus or yolk enters the body from the ventral side, establishes the 10 orders *primates*, *cheiroptera*, *insectivora*, *rodentia*, *carnivora*, *edentata*, *proboscidea*, *ungulata*, *sirenoidea*, and *cetacea*.—We will add a few other classifications deserving of mention. Prince C. L. Bonaparte (Rome, 1881) gives a tabular arrangement as follows: Class I., *mammalia*, sub-class *quadrupeda*: section 1, *unguiculata*, with the 7 orders *primates*, *cheiroptera*, *fera*, *pinnipedia*, *marsupialia*, *glires*, and *bruta* (edentates); section 2, *ungulata*, with the orders *pecora* and *bellua*;—sub-class *bipeda*, with the order *cete*. Class II., *monotremata*, with the orders *tachyglossa* (echidna) and *platypoda* (ornithorhynchus). He makes in all 1,188 species. In a supplement (1882) he calls the second sub-class *cete*, and divides it into the orders *sirenia* and *hydraula*. Straus-Durckheim (1848) gives 12 orders, *bimana*, *quadrumania*, *plantigrada*, *carnivora*, *marsupialia*, *cheiroptera*, *rodentia*, *edentata*, *pachydermata*, *ruminantia*, *amphibia*, and *cetacea*. Milne-Edwards (1855), in his allantoidian sub-branch of the *osteozoaria* or vertebrates, divides the class *mammalia* into: I., *monodelphya*: 1, *propria*, with orders *bimana*, *quadrumania*, *cheiroptera*, *insectivora*, *rodentia*, *edentata*, *carnivora*, *amphibia*, *pachydermata*, and *ruminantia*; 2, *pisceformia*, with the order *cetacea*;—II., *didelphya*, with the orders *marsupialia* and *monotremata*. Van der Hoeven (1856) makes 2 sections of *mammalia*: I., *acotyledona* with the orders: 1, *monotremata*, and 2, *marsupialia*;—II., *placentalia*, with orders: 3, *cetacea*; 4, *pachydermata* (divided into the proboscidean, perissodactyle, and artiodactyle phalanxes); 5, *ruminantia*; 6, *edentata*; 7, *glires*; 8, *fera*; 9, *cheiroptera*; 10, *plenopleura* (flying lemur or *galeopithecus*); 11, *quadrumania*; and 12, *bimana*. Baird (in vol. viii. of the "Pacific Railroad Survey," 1857) adopts the following arrangement: A, *unguiculata*, with the orders: 1, *quadrumania*; 2, *cheiroptera*; 3, *rapacia*; 4, *marsupialia*; 5, *rodentia*; and 6, *edentata*;—B, *ungulata*, with orders: 7, *solidungula*; 8, *pachydermata*; and 9, *ruminantia*;—C, *pinnata*, with orders: 10, *pinnipedia*; and 11, *cetacea*. All of these, except the 1st, are found in North America; the horse, though not existing native, formerly was an inhabitant of this country. Agassiz, in his essay on classification (1857), makes mammals the 8th class of vertebrates, with only the 8 orders of *marsupialia*, *herbivora*, and *carnivora*.—Owen (in the article "Mammalia" in the "Cyclopædia of Anatomy and Physiology," 1847) admits in the sub-class of *placentalia* the 10 orders of *bimana*, *quadrumania*, *cheiroptera*, *insectivora*, *carnivora*, *cetacea*, *pachydermata*, *ruminantia*, *edentata*, and *rodentia*, and in the sub-class *implacentalia* the orders *marsupialia* and *monotremata*; the monkeys by the *galeopithecus* are connected with the *cheiroptera*, and by the lemurs with the *carnivora*; the last

by *otaria* are related to *cetacea*, which in turn have certain affinities with the fishes; the rodents are connected with ruminants by the musk deer; the *monotremata* lead to reptiles. Before introducing the most recent classification of mammals by Prof. Owen, according to the cerebral system, the reader should be reminded that until the time of Cuvier the principal subdivisions were based upon the Aristotelian characters derived from the organs of locomotion, the secondary groups being established on the peculiarities of the dental system; Cuvier added others drawn from the osseous and generative systems; De Blainville in 1816 first adopted the division, according to the method of reproduction, into monodelpha, didelpha, and ornithodelpha, or ordinary mammals, marsupials, and monotremes, retaining for the most part the Linnæan orders. Classification by the placenta seems to have been first proposed by Sir Everard Home, but, as modified by successive naturalists, leads to many unnatural affinities—placing, for instance, rodents and insectivora with monkeys, and solipeds, pachyderms, and some ruminants with the carnivorous cetaceans. Prince Bonaparte, in his *Systema Vertebratorum* (1840), adopts the division of *placentalia* and *implacentalia*, subdividing the first into the sub-classes of *educabilia* and *ineducabilia*, the latter including the orders *bruta*, *cheiroptera*, *insectivora*, and *rodentia*, with the common character of a single-lobed cerebrum; this Prof. Owen regards as the most important improvement since the establishment of the natural character of the ovo-viviparous or implantal division. In 1845 Isidore Geoffroy St. Hilaire raised the marsupials to the rank of a distinct class, making its subdivisions orders equivalent to those of the *placentalia*; Owen, however, did not regard them as groups of equal rank and value. In 1849 Prof. Owen, from the consideration of the times of formation and the succession of the teeth, divided mammals into 2 groups, monophyodonts, or those which generate a single set of teeth (as the *monotremata*, *bruta*, and *cetacea*), and the diphyodonts, or those which generate 2 sets of teeth (comprising the great bulk of the class); at the same time he wished it to be clearly understood that this dental character is not so associated with other organic characters as to indicate natural or equivalent sub-classes. As early as 1842 he drew attention to the value of the principal modifications of the mammalian brain in regard to their association with concurrent modifications in other systems of organs; it was not until 1857, however, that he felt himself justified in proposing to the Linnæan society a fourfold division of this class, based upon the four leading modifications of the cerebral structure. His first and lowest group or sub-class is called *lyencephala*, signifying the loose or disconnected state of the cerebral hemispheres, which leave exposed the olfactory ganglia, the cerebellum, and more or less of the optic lobes, have the surface gener-

ally smooth, and the anfractuosities, when present, few and simple; in this division the absence of the corpus callosum commissure is associated with the marsupial mode of development and the non-development of the placenta; it includes the monotremes and marsupials. The next stage in the development of the brain is where the corpus callosum is present, but the hemispheres leave the olfactory lobes and cerebellum exposed, and are commonly smooth or with few and simple convolutions; these are the *lissencephala*, or smooth-brained mammals, or rodents, insectivora, bats, and edentates, in many respects, in common with the preceding subdivision, resembling birds and reptiles. The third modification is an increased relative size of the hemispheres, which extend over more or less of the cerebellum and olfactory lobes, and have their surface, except in a few of the lower quadrumana, folded into more or less numerous gyri or convolutions; hence this sub-class is called *gyrencephala*; among these are not found marks of affinity with the ovipara, but the highest mammalian perfection is attained,

as shown by the size, strength, activity, sagacity, and docility of many of its members; this sub-class comprises the other orders of mammals, man only excepted. In man the hemispheres overlap the olfactory lobes and cerebellum, extending in advance of the former and further back than the latter; in man only is there what is called a 3d or posterior lobe, and in him the superficial gray matter attains its highest development through the number and depth of its convolutions; as representing a distinct sub-class of mammalia, and ruling naturally over all the other members of the class, he proposes for man the name of *archencephala*, signifying that he is master of the earth and of the lower creation. For details on the characters of the secondary groups and their distribution in time and space, the reader is referred to the original paper in the "Proceedings of the Linnæan Society" of London, vol. ii. pp. 1-37, 1857. As his tabular arrangement is the latest and in many respects the best, and as it is not generally accessible to students, it is reproduced here entire. It is as follows:

Class.	Sub-class.	Order.	Family or genus.	Example.
MAMMALIA	GYRENECEPHALA.	ARCHENCEPHALA	<i>Homo</i>	Man.
		QUADRU MANA	<i>Catarrhina</i>	Ape.
			<i>Platyrrhina</i>	Marmoset.
		CARNIVORA	<i>Strepsirrhina</i>	Lemur.
			<i>Digitigrada</i>	Dog.
		ARTIODACTYLA	<i>Plantigrada</i>	Bear.
			<i>Pinnigrada</i>	Seal.
		PERISSODACTYLA	<i>Omnivora</i>	Hog.
			<i>Ruminantia</i>	Sheep
		PROBOSCIDIA	<i>Solidungula</i>	Horse.
	<i>Multungula</i>		Tapir.	
	LYSENCEPHALA.	TOXODONTIA	<i>Elephas</i>	Elephant.
			<i>Dinotherium</i>	Extinct.
		SIRENIA	<i>Toxodon</i>	"
			<i>Nasodon</i>	"
		CETACEA	<i>Manatus</i>	Sea cow.
			<i>Halicore</i>	Dugong.
		BRUTA	<i>Delphinida</i>	Porpoise.
			<i>Balanida</i>	Whale.
		CHEIROPTERA	<i>Bradyrodida</i>	Sloth.
			<i>Dasyrodida</i>	Armadillo.
	LISSENCEPHALA	INSECTIVORA	<i>Edentula</i>	Ant-eater.
			<i>Frugivora</i>	Rousette.
		RODENTIA	<i>Insectivora</i>	Bat.
			<i>Talpida</i>	Mole.
		MARSUPIALIA	<i>Erinaceida</i>	Hedgehog.
			<i>Soricida</i>	Shrew.
		MONOTREMATA	<i>Non-claviculata</i>	Hare.
			<i>Claviculata</i>	Rat.
		LYSENCEPHALA	<i>Rhizophaga</i>	Wombat.
			<i>Poëphaga</i>	Kangaroo.

The fossil mammals must be considered, before the student can form an idea of the affinities of the class; these and the orders of existing mammalia will be treated under their respective titles. The mammalian class has existed certainly from the lower eolitic period, and probably from the triassic; during this immense lapse of time genera and species have changed, either that they have been newly created at the several epochs, or, as Darwin maintains, have been modified by processes of natural selection, many original and intermediate forms having become extinct, and, from the imperfection of the geological record, as yet having afforded no indication of their exist-

ence. None of the mammalian genera of the secondary epoch have been found in the tertiary ones; no genus of the older eocene has been discovered in the newer; very few eocene genera have been found in the miocene, and none in the pliocene; many of the miocene genera are peculiar to that division, and some indistinguishable from existing species begin to appear only in the newer pliocene; while the perissodactyles and omnivorous artiodactyles have been gradually dying out, the true ruminants have been increasing in genera and species. One class of organs seems to govern one order, and another class another order; for example, the teeth, so diversified in marsupials

and edentates, are remarkable for the constancy of their characters in rodents and insectivora; as a general rule, the characters from the dental, locomotive, and placental systems are more closely correlated in the *gyrencephala* than in the 2 inferior sub-classes. (See also a lecture before the university of Cambridge in May, 1859, by Prof. Owen, "On the Classification and Geographical Distribution of Mammalia," London, 1859.)

MAMMARY GLANDS, the organs which secrete the nutritive fluid, milk, by which the young of man and the mammalia are nourished during the early periods of life. They vary from 2 in the human female to 10 or 12 in the lower mammals, and may be pectoral as in the former, or pectoral and abdominal, or only abdominal, as in the latter. Each gland is made up of a number of separate glandules, more or less closely connected by fibrous tissue and fat, and bound down by the same to the pectoral or abdominal muscles. The lactiferous tubes arising from the minute ultimate follicles of the lobules terminate in the mamillary tubes of the nipple, 10 or 12 in the human female, straight but of variable size; at the base of the nipple, and extending into the gland, are reservoirs for containing a constant supply during lactation; these are often much larger in the lower animals than in woman. The skin covering them is very delicate and smooth; the colored circle around the nipple is called the *areola*, which becomes darker during and after gestation; the irregular surface of the nipple is covered with a very sensitive skin, and much erectile tissue enters into its substance. The tubes are lined with a very vascular mucous membrane, which has its own secretion sometimes in considerable quantity. These glands, especially during lactation, are well supplied with blood from branches of the subclavian and axillary arteries; their nerves come from the brachial plexus and the intercostals. The inner surface of the follicles is covered with a layer of epithelium cells, the real agents in the secreting process. They present no great difference in size in the sexes until near the age of puberty, when a considerable enlargement takes place in the female; from the increased supply of blood during gestation, there is a sense of tenderness and distention which is one of the earliest and most valuable signs of pregnancy. These glands in the male are miniatures of those of the female, but the essential structure is the same, as is shown by the authentic cases of infants suckled by men; a mucous fluid may frequently be pressed from the male nipple. Though the functional activity of these glands is naturally limited to the period succeeding parturition, their secretion is sometimes seen in virgins and in aged women, in whom a strong desire to furnish milk and a continued irritation of the nipple by the infant's mouth have stimulated the organs to unnatural activity; similar facts are known in men and the males of lower mammals. The permanent secretion of milk

in domestic cows is a modified function of the action of these glands, resulting from an artificial habit continued through many generations; in the extensive herds of South America the secretion of milk, from the non-interference of man, is an occasional phenomenon, according to Roulin, continuing as in other animals only during the suckling of the young. The presence of these organs has given the name to the *mammalia*, the highest class of vertebrated animals, implying a mode of intra-uterine and extra-uterine development not found in birds, reptiles, or fishes. Physiologically these glands belong to the generative system, and are gradually removed from the caudal to the pectoral region, as we ascend from cetaceans to the human female, in whom the helplessness of the infant becomes the means of the moral training of the mother; the forward, outward, and upward direction of the nipples is exactly adapted to the position of the child lying in its mother's arms, and the greater abundance of the lactiferous tubes at the lower portion of the breast forms a soft cushion for its head to rest upon. In the African and sometimes in other races, after lactation, the skin covering the breasts becomes so lax, and the organs so elongated, that they can be thrown over the shoulders like bags. The mammary glands are subject to many painful and dangerous diseases, among which may be mentioned acute and chronic inflammations, abscesses, and encysted, fibrous, and cancerous tumors; they are sometimes enormously overloaded with fat.

MAMMEE APPLE (*mammea Americana*, Linn.), a handsome tree of 60 feet in height, native of the Caribbean islands and the neighboring continent. It has large, oval or obovate, shining, leathery, opposite leaves, white, sweet-scented flowers, and large, round, obsoletely 3 or 4 cornered fruit, about the size of a cannon ball. The fruit is covered with a double rind; the outer is leathery, tough, and brownish yellow; the inner, thin, yellow, closely adhering to the flesh, which is firm, bright yellow, and of a singular pleasant taste and a sweet aromatic smell; but the skin and seeds are very bitter and resinous. It is eaten alone, or cut up into slices with wine and sugar, or more commonly prepared as a jam or marmalade, or with sirup. From the yellowness of the pulp, like that of an apricot, it is called by the French *abricot sauvage*. The bitterness of the kernel is employed to impart a flavor to noyau and other cordials. The tree belongs to the natural order of *guttifera*. Browne ("Natural History of Jamaica," London, 1756) speaks of the species as among the largest trees of Jamaica, and esteemed among the best timber trees. It has been observed that no one can behold this tree towering above a cluster of fruit trees without a sentiment of respect for it. There is an African species (*M. Africana*), which grows to a large tree on the mountains of Sierra Leone, and which produces excellent fruit. Two or three other species are known to botanists.

MAMMOTH, or **MAMMONT**, the fossil elephant of Siberia (*elephas primigenius*, Blumenbach), found in the diluvial strata of Europe and Asia, and perhaps also in North America. Large fossil bones were alluded to by Theophrastus, Pliny, and many ancient authors, and were generally supposed to be the remains of giant men. They are abundant in the drift of central and northern Europe, mingled with bones of other pachyderms, principally in river basins; in Great Britain in the Kirkdale cavern of Yorkshire; in Sweden and Norway, but most abundantly in the frozen region of European and Asiatic Russia, about the mouths of rivers descending into the icy sea; there is indeed hardly a river in Siberia in whose bed or on whose banks these remains have not been found, as well as in the neighboring plains, in connection with bones of other animals now strangers to the climate; they are not found in the elevated districts. In Siberia fossil ivory is so abundant and so well preserved that it gives rise to a considerable traffic both for home and foreign use. The inhabitants explain this by the following fable: they believe that the soil of Siberia is undermined by gigantic animals, living like moles, and unable to endure the light of day; these animals they call mammoth or mam-mont, either from the Tartar *mamma* (signifying earth), or the Arabic *behemoth* (a large animal), often added by the Arabs to the name of the elephant; the tusks are the supposed horns of the animals, which were formerly so valuable that the czars reserved for themselves the monopoly of the trade; this fable is current over the greater part of northern Asia, and especially China. The most remarkable discovery in relation to the mammoth was the occurrence of a carcass found by a Tungus fisherman in a block of ice on the border of the Arctic sea in 1799, near the river Lena; in the course of a few years this immense mass was thawed out, and it was found to be an elephant having the flesh and soft parts well preserved, with the exception of such portions as had been devoured by bears, dogs, and other carnivorous animals; the tusks were very fine, weighing 800 lbs., and were removed by the fisherman. In 1806 Mr. Adams, travelling for the museum of St. Petersburg, visited the locality and collected the remains, which were transported to St. Petersburg, where the skeleton now is, in a nearly perfect condition; he ascertained that the skin had an abundant covering of hair and wool, indicating that it was fitted to resist a cold climate. From this it is evident that the climate of Siberia during the diluvial period was not like that of the regions now inhabited by elephants; it must have been moderately cold, though such as would permit the growth of a vegetation more luxuriant than any in the present arctic regions, and sufficient for the nourishment of these bulky animals. Another more recently discovered specimen allowed even a microscopic examination of the tissues. The following are the differences between the fossil and living elephants, as deter-

mined by Cuvier. In the former the laminae of the teeth are narrower and more numerous than in the Indian elephant, which they most resemble, with the lines of enamel more slender and less festooned, and the teeth absolutely and relatively wider. The tusks are larger than in most living specimens, and generally more curved, but the structure is the same. In the skull, there is much greater length and perpendicularity in the sockets for the tusks; the head is more elongated, with a greater development of occiput, and concave and nearly vertical forehead; the long alveoli must have modified the trunk, and have given the animal a different physiognomy from that of the present elephant; the antero-posterior length of the lower jaw is less, the lower molars are parallel instead of converging forward, and the jaw is truncated in front instead of having a projecting grooved symphysis. The bones of the limbs are more massive, and the usual distance between the two condyles of the femur is reduced to a narrow line. The skin is like that of the living elephant, but is covered with hair of 3 kinds; the longest, 12 or 15 inches, is brown and like horse hair; the shorter, 9 or 10 inches, is more delicate and fawn-colored; and the wool at the base of the hair, 4 or 5 inches long, is fine, smooth, fawn-colored, and a little frizzled toward the roots; there is a mane on the neck, and the whole covering is well suited for a cold climate. The mammoth has never been found living, nor have any of the existing elephants been discovered in the fossil state; it was probably not much if at all higher than the elephants of the present epoch, but was stouter, more clumsy, and heavier. Their bones are found mingled with those of the rhinoceros, ox, antelope, horse, often with marine animals, and sometimes with fresh water shells. They were undoubtedly overwhelmed by a comparatively recent and sudden catastrophe during some portion of the long drift period, accompanied by a depression of temperature, and probably by a subsidence of the land and an invasion of the sea, general over the northern regions of both hemispheres; during the preceding tertiary epoch there was an elevation of temperature, permitting tropical animals to go far to the north; this temperature gradually became colder, the animals becoming adapted for it, as shown by their external covering, until they suddenly became extinct during the glacial period of the drift. From the abundance of the remains found in Siberia, it is inferred that elephants were more numerous during the diluvian epoch than at the present time. To the *E. primigenius* belong the Siberian fossils, and most, if not all, of those of the drift of Europe.—Several species of fossil elephant have been found in North America, referred by some to the *E. primigenius*. Prof. H. D. Rogers ("Proceedings of the Boston Society of Natural History," vol. v., Feb. 1, 1854) drew attention to the fact that while the European mammoth is found in the drift stratum, the North American fossil elephant is imbedded in strata above the drift,

of a distinctly more recent age, and was a contemporary of the *mastodon giganteus*, their bones being found together in the marshy alluvium of Big Bone Lick; he maintains that they lived together in the long period of surface tranquillity which succeeded the strewing of the general drift (the period of the Laurentian clays), and were overtaken and exterminated together by the same changes, partly of climate, partly of a second but more local displacement of the waters which reshifted the drift, and formed the later lake and river terraces. In the pliocene deposits of Kansas and Nebraska Dr. Hayden found bones of mastodon and elephant (*E. imperator*, Leidy), and a similar coexistence has been ascertained in the pliocene of Europe; their remains have been found in Kentucky, Texas, Mexico, Spanish America, and even as far as the arctic circle. The elephants of the tertiary sub-Himalayan Sivalik hills have been described by Cautley and Falconer; in these the dental laminae are so separated that each forms the summit of a ridge, making a transition from elephant to mastodon, constituting the genus *stecodon* (Cautley and Falconer). The mammoths of the American continent are now generally admitted to be different species from those of Europe and Asia.—For details on the mammoth, see Cuvier's articles in vol. viii. of the *Annales du muséum*, and in vol. i. of the *Ossemens fossiles*; Pictet's *Traité de paléontologie*, vol. i.; and vol. v. of the "Naturalist's Library," which treats of the pachyderma.

MAN, **ISLE OF** (Manx, *Mannin*, or *Ellan Vannin*; anc. *Monapia*, or *Monarina*), an island belonging to Great Britain, in the Irish channel, about midway between England, Scotland, and Ireland, its centre lying in lat. 54° 16' N., long. 4° 30' W.; length, N. N. E. and S. S. W., 81 m.; breadth from 8 to 12 m.; area, 209 sq. m.; pop. in 1851, 52,116. The coasts are very irregular, and on the E. and S. W. are precipitous. There are numerous bays with good anchorage. A ridge of mountains traverses the length of the island, culminating in Mt. Sneafeld at an elevation of 2,086 feet above the sea. Its prevailing geological formation is clay schist, varied on the E. side with large masses of granite. The principal rivers are the Sulby, Neb, Silverburn, Dhu, and Laxey, all of which are very small. The climate is mild and equable, the mean temperature of summer being 59° F. and of winter 41.57°. The mineral resources of the island consist of lead and copper, which are extensively mined, silver, which is extracted from the lead ore in the proportion of 20 oz. to the ton, lime, marble, granite, rotten stone, ochre, and white spar. The soil is fruitful, and agriculture is in a forward state. Oats, barley, wheat, turnips, and hay are the principal crops. A native breed

of small sturdy horses, an inferior kind of sheep, horned cattle, and pigs in great numbers, are among the domestic animals. The island possesses a breed of cats having either no tail, or at most a merely rudimental substitute for it. Sea birds and some rare kinds of fish are also found. The fisheries of herring, &c., are the principal reliance of the islanders, though some activity has recently been displayed in manufactures. The government is vested in the queen in council, the governor, and the "house of keys" (see **CLAVES INSULÆ**), whose concurrence is necessary to give validity to every law; and the acts of the British parliament do not affect the isle of Man unless expressly extended to it. The governor is appointed by the crown and assisted by a council of officers. Beside the ordinary civil and ecclesiastical courts, there are ancient tribunals called "deemsters' courts," the judges of which, called deemsters, are chosen by the people, one for the N. and another for the S. division of the island, and possess very extensive authority. Questions relating to the herring fishery are tried before an officer called the water bailiff, who also appoints two fishermen called admirals to preserve order among their fellows.—The island was originally peopled by the Manx (*Menapia*), a Celtic tribe, whose language, a sub-dialect of the Gallic or Celtic, forming one branch with the Erse and Irish, is still spoken in the N. W. and W., though English is generally understood. The island was held for some time as a feudal sovereignty by the earls of Derby, and afterward by the dukes of Athol, from whom the sovereignty and revenues were purchased by the crown in 1765 for the sum of £70,000, to which an annuity of £2,000 was subsequently added. In 1829 the duke's remaining interests in the island, including the manorial rights and patronage of the see, were sold to the crown for £416,114. Chief towns, Castletown (the capital), Peel, Douglas, and Ramsay.

MANAGUA, a city and the nominal capital of Nicaragua, situated on the S. shore of the lake of the same name, in lat. 12° 14' N., long. 86° 43' W.; pop. about 12,000, for the most part proprietors of the fertile lands which surround it, and which are productive in all tropical staples. Owing chiefly to the rivalries of the cities of Granada and Leon, and partly to its central position, it has been selected as the place of meeting of the legislative chambers. The offices of the government are, however, in Leon.

MANAGUA LAKE, a beautiful body of water in Nicaragua, 50 m. long by from 80 to 85 m. wide, elevated 186 feet above the Pacific ocean, from which it is separated by a ridge of land 15 m. broad in its narrowest part. It has a depth of water varying from 2 to 40 fathoms. It has an outlet at its S. extremity called Rio Tipitapa, connecting it with Lake Nicaragua through the Estero de Panaloya. The difference of level between the two lakes, at average stages of water, is 28 feet 6 inches. The Rio Tipitapa,

during severe rainy seasons, passes a considerable body of water; but it is often completely dry, the evaporation from the surface of the lake exceeding the supply of water from its tributaries. In the various projects for an interoceanic communication through Nicaragua, it has been proposed to connect the two lakes by means of a canal, deepening the Estero de Panaloya and constructing a series of locks to the superior lake, with another canal from the lake to the port of Tamarinda or of Realijo, or by means of the Estero Real to the bay of Fonseca. Between the N. portion of the lake and the Pacific there is only the magnificent plain of Leon, having an elevation at its highest part of about 50 feet above the level of water in the lake. The volcano of Momotombo projects boldly into the lake at its N. extremity, and within the lake itself rises the island cone of Momotombita, which had a sacred repute among the aborigines, and still contains numbers of their idols and other monuments, concealed beneath the shadows of its dense forests. The city of Leon was first built on the shore of the N. W. extremity of the lake, at a place called Moabita, abandoned for the present site in 1610.

MANAKIN, the name applied to the denti-rostral birds of the family *ampelidæ* or chatterers and sub-family *piprina*; they are generally small and of brilliant colors, and with one exception inhabitants of the warmer parts of South America. They have a moderate or short bill, depressed, with broad base, curved ridge, compressed sides, and toothed tip; the nostrils are hidden by the frontal feathers; the wings generally short and pointed; tail short and even; tarsi moderate and slender; toes long, the outer united to the middle to beyond the 2d joint; claws acute. The red manakin or chatterer (*phanicercus carnifex*, Swains.) is about 7 inches long; the crest, lower back, rump, lower belly, thighs, and vent, bright crimson; rest of plumage dull red, dusky on the back; tail crimson, with end and outer web dusky brown; the female is of a general greenish olive color, with tinges of red on the head, abdomen, and tail; the young birds are brownish with whitish markings. This and the *P. nigricollis* (Swains.) inhabit the eastern parts of tropical South America.—The blue-backed manakin (*pipra parvula*, Linn.) is 4½ inches long; the plumage is black, with the back and lesser wing coverts blue, and a crest of bright crimson feathers; the female and young are greenish. The long-tailed manakin (*P. caudata*, Shaw) has the body blue, crest crimson, and wings black, and the two middle tail feathers extend about one inch beyond the rest and are of a blue color. The black-capped manakin (*P. manacus*, Linn.) is black above, beneath white, with a spot on the neck and wings white. The red and black manakin (*P. aureola*, Linn.) has the head, neck, throat, and breast crimson, and the rest of the plumage black with a steel gloss, the middle of the belly reddish, a white spot on the wings, and beneath them yellow. There are more

than 80 other species. These beautiful and active birds inhabit damp woods, on the borders of which they live in small flocks, seeking for insects and fruits.—The rock manakins belong to the genus *rupicola* (Briss.), of which the best known species is the orange manakin or cock of the rock (*R. crocea*, Bonn.); the plumage is saffron orange, with the quills partly white and partly brown, and the wing coverts loose and fringed; it has a singular crest of feathers arranged in 2 planes, arising from the sides of the head and meeting over and in front of the bill; the size is that of a small pigeon. This handsome species inhabits rocky places near the borders of the streams in Guiana, and its legs and feet are nearly as stout as in a gallinaceous bird of the same size, whence its common name; it is active and suspicious, feeding on fruits and berries; the nest is placed in holes in the rocks, composed of roots, grass, and earth, lined with finer materials; it lays 2 white-eggs, about the size of those of a pigeon; it is now comparatively rare, as it is hunted for the beauty of its plumage. There is a species in Peru (*R. Peruviana*, Lath.), of a reddish saffron color, with black quills and tail, and ashy wing coverts; it is a little larger than the other.—The only old world representative of this sub-family belongs to the genus *calyptomena* (Raffles), found in the thick forests of Java and Sumatra; the plumage is shining green, with a spot on each side of the nape, 8 oblique stripes on the wings, and the quills, except the outer margins, dark-colored. The only species described by Gray is the green manakin (*C. viridis*, Raffl.), about 6 inches long; the color so nearly resembles the foliage of the high trees upon which it generally perches, that it is very difficult to see and to procure; its food is entirely vegetable.

MANASSEH. I. One of the two sons of Joseph, son of Jacob, adopted by the latter on his deathbed to become the head of one of the tribes of Israel. On the conquest of Palestine, half of the tribe received its allotment from Moses E. of the Jordan, N. of Gad, and the other half from Joshua W. of the Jordan, between Issachar on the N. and Ephraim on the S., the Mediterranean forming the W. boundary. The eastern division contained among others the districts of Ituræa, Trachonitis, Gaulonitis, Batanæa, and part of Gileaditis, and the towns of Gadara, Ashtaroth, Edrei, Gamala, Jabesh Gilead, Mahanaim, and Gerasa. The western division was less important in history, it being almost always overshadowed by its southern neighbor, Ephraim. II. A king of Judah. (See HERBERTS, vol. ix. p. 85.)

MANATEE, LAMANTINE, or SEA COW, a large aquatic mammal (*manatus*, Cuv.), arranged by Ouvier among cetaceans, forming with the dugong the herbivorous group of this order, the family *sirenia* of Illiger. Recently, on account of their many important differences of organization, they have been approximated to the pachyderms; their proper position is probably in an order which may be called *sirenoida*, in-

intermediate between pachyderms and true cetaceans. The manatee has the elongated, fish-like body of the whales, the anterior limbs flattened into fins, the posterior limbs wanting and only represented by a rudimentary pelvis, and the tail oval, about $\frac{1}{2}$ of the extent of the body, ending in a flattened, horizontal, rounded, caudal expansion; in these respects it resembles cetaceans. Its principal pachyderm affinities are: the separation of the cervical vertebrae; the smaller total number in the whole column, and the absence of osseous disks between the bodies; the articulation of the ribs to 2 vertebral bodies and to transverse processes; the long and narrow scapula; the regularly shaped humerus; the rounded radius and ulna; the compact structure of the phalangeal bones; the wide separation of the occipital condyles, and their partly horizontal position, and the large size of the occipital foramen; the well marked and strong sutures, and the absence of internal bony falcies; the fusion of the parietals into one; the position of the frontals as usual in front of the parietals; the strong zygomatic arches; the symmetry of the cranial bones and their usual position; the shape of the jaws, and the character of the molars; and the structure of the stomach and heart. Many other distinctions are given in the "Proceedings" of the 8d meeting of the American association for the advancement of science, Charleston, S. C., 1850 (pp. 42-47). The head is conical, without distinct line of separation from the body; the fleshy nose much resembles that of a cow, the nostrils opening as usual on the end of the snout; the full upper lip has on each side a few bristly tufts of hair; the mouth is not large, and the eyes are small; the openings of the ears are very small. The swimming paws are more free in their motions than in cetaceans, and may be used also for crawling up the muddy banks of the rivers in which they dwell; the separate bones may be felt through the skin, and the fingers are provided with small nails. The skin is of a grayish black color, becoming black on drying, with a few scattered bristles. In the young animal there are 2 sharp incisor teeth in the upper jaw, which afterward fall out; there are no canines; the molars are generally $\frac{1}{2}$ - $\frac{3}{4}$, with quadrangular flat crowns, divided by a transverse groove. The bones are dense and heavy, differing in this from cetaceans; the ribs are numerous and rounded; the mammae are 2 and pectoral; the intestinal canal is 10 or 12 times the length of the body, in accordance with the vegetable character of their food; the stomach has 2 caecal appendages in the pyloric portion, which is separated from the cardiac by a constriction. They inhabit the sea shores, especially about the mouths of rivers, and the rivers themselves, keeping near the land, feeding upon algae and aquatic plants; they do not feed upon the shores, though they sometimes quit the water, and not unfrequently support themselves in the shallows in a semi-erect position; under these circum-

stances they present at a distance somewhat of human appearance, increased by the distinct lips, the long whiskers in the males and the pectoral mammae in the females. The largest and best known species is the Florida manatee (*M. latirostris*, Harlan), which inhabits the gulf of Mexico, the West India, and the shores of Florida; it attains a length of 15 or 20 feet, but is generally about 12. They are usually seen in small troops, associating for mutual protection and for the defence of their young; they are harmless even when attacked, of gentle disposition, not afraid of man, and rarely quarrelling with each other. Being found only in shallow waters, they are easily captured by the natives, who kill them with harpoons, lances, and arrows, for the sake of their flesh, which is wholesome and palatable. The South American manatee (*M. australis*, Wiegman), usually 9 or 10 feet long, is not uncommon about the mouths of the great rivers of northern Brazil and Guiana; it ascends the streams several hundred miles, and even into inland fresh water lakes; the flesh of this aquatic mammal is considered fish by the Roman Catholic church in Brazil, and may consequently be eaten on fast days; salted and dried in the sun, it is an excellent meat; the oil from the blubber is of fine quality, and free from smell; the hide is made into harnesses and whips, and is noted for strength and durability. An African species (*M. Senegalensis*, Desm.) is rarely more than 9 feet long. The manatees are all tropical, but are not found in the Pacific and Indian oceans, their place being there taken by the allied dugongs (*halicore*, Illiger).—There is among the Russians an animal called the northern manatee or sea cow; this is the creature described by Steller, forming the genus *rhytina* (Ill.) or *Stelleria* (Cuv.). This, the *R. Stelleri* (Desm.), was unknown before 1741, when Behring's second expedition was wrecked on an island in the straits bearing his name; its flesh formed the principal food of the shipwrecked mariners for nearly a year; one of the party, M. Steller, described the animal, and his account was published in St. Petersburg, and probably contains all that will ever be known concerning it, as in 1768 the crews of the ships in pursuit of sea otters had entirely exterminated it; it has met the fate of the dodo, but at a much more recent period; a skull and a few fragments are said to exist in European museums. It had no teeth, the jaws being covered with an undulating surface of horny tubular matter; the head was small, the body covered with a thick, fibrous, fissured epidermis, and the caudal fin lunate. It attained a length of 25 feet, and formerly lived in the neighborhood of Behring's island on the coast of Kamtschatka. The epidermis had a singular structure, being composed of perpendicular horny tubes, sometimes an inch in length, of a blackish brown color, rough and wrinkled like the bark of a tree, and so tough as to be with difficulty cut with an axe; it served to protect the animal

from the ice and sharp rocks among which it fed. They lived in shallow water in troops, the older protecting the younger; they were harmless and very tame, and strongly attached to each other; they fed on fuci under water, and the skin, fat, and flesh were esteemed by the natives. The fossil *dinotherium* belonged to this sirenoid class of mammals.

MANAYUNK, a town of Pennsylvania, on the left bank of the Schuylkill, and on the Philadelphia and Norristown railroad, included in the chartered limits of the consolidated city of Philadelphia, and 7 m. from the state house; pop. in 1850, 6,158. Extensive water power is afforded by the waste water of the Schuylkill canal, and there are large manufactories of cottons, jeans, and woollen goods. It contains 6 Protestant and 2 Roman Catholic churches. The river is here crossed by 2 bridges.

MANBY, **GEORGE WILLIAM**, an English officer, born in Hilgay, Norfolkshire, Nov. 28, 1765, died in Southtown, near Great Yarmouth, Nov. 18, 1854. He was educated at the military college of Woolwich, and became in 1803 barrack master at Great Yarmouth. Here, his attention having been drawn to the calamities which resulted, in cases of shipwreck, from the difficulty of establishing communication with the shore, he attempted casting a rope from the shore to the wreck by the agency of gunpowder. The great problem to be solved in this operation was the maintenance of the connection between the rope and the mortar during its transmission. Chains were unable to stand the shock of the discharge, but stout strips of raw hide closely plaited together were found to answer; and on Feb. 12, 1808, the entire crew of the brig *Elizabeth*, wrecked within 150 yards of the beach, were rescued by the simple contrivance of Capt. Manby. In 1810 his invention was brought before a committee of the house of commons, and having been favorably reported on, he received a grant of money, and all the dangerous stations on the British coasts were supplied with his apparatus. He also contrived a pyrotechnic which renders vessels visible from shore on the darkest night; and shells filled with luminous matter, to enable the crew to perceive the approach of the rope, in the manufacture of which he suggested several improvements. Capt. Manby received altogether from the British government, as the reward of his inventions, about £7,000. He published the "History and Antiquities of the Parish of St. David, South Wales" (1801), and kindred works; also "Journal of a Voyage to Greenland in 1821" (1822); and a number of writings relative to shipwrecks and to his various inventions.

MANCHA, **LA**, an old province of Spain in the S. part of New Castile, now forming the principal part of the modern province of Ciudad Real; area, 7,500 sq. m.; pop. 250,000. The N. and S. portions are mountainous, and the centre in general a desolate sandy plateau. The towns are few and uninteresting; the cottages and the villages are built of mud. The country

is denuded of trees, exposed to the wintry blasts, and scorched by the summer heat. The earth is arid and stony; the dust is impregnated with saltpetre, and the glare of the sun almost blinds the eye. Water is wanting, and dry dung is used for fuel. In some places, however, corn, saffron, and wines are produced; and the mules of *La Mancha* are celebrated. The native of the country is jovial, honest, industrious, brave, and temperate. The scenery of *La Mancha* has become celebrated by the descriptions of Cervantes in "Don Quixote."

MANCHE, **LA**, a N. W. maritime department of France, in the old province of Normandy, bounded W. and N. by the English channel, E. by the same and the departments of Calvados and Orne, and S. by Mayenne and Ille-et-Vilaine; area, 2,291 sq. m.; pop. in 1856, 595,202. The coast is in some parts rocky and precipitous, but is indented with several excellent harbors, the principal of which are Ocherbourg, La Hogue, and Granville. *La Manche* has several short but navigable rivers, the principal of which is the Vire, and is traversed from N. to S. by a hilly range of moderate height, called Cotentin, which slopes gradually toward the sea on each side. The rest of the surface is in general undulating, the soil rich, and the climate moist and mild. The quantity of cider annually made exceeds 22,000,000 gallons. A considerable portion of the land is under pasturage. The horses of *La Manche* are considered the best in France. Iron, lead, and coal are mined, and granite, marble, slate, and limestone are quarried. Salt is largely manufactured on the coast; and in the towns there are manufactories of iron, zinc, copper, woollen, and cotton. Capital, St. Lô.

MANCHESTER, a city and one of the shire towns of Hillsborough co., N. H., situated mostly on the E. bank of the Merrimack river at the falls of Amoskeag, 18 m. S. S. E. from Concord, and 59 m. N. W. from Boston; pop. in 1838, about 50; in 1850, 18,938; in 1860, about 22,000. It was first settled in the neighborhood of the falls about 1730, incorporated under the name of Derryfield in 1751, and named Manchester by act of the legislature in 1810. It received a city charter in 1846. The city is regularly laid out in squares, and the main street is 100 feet wide, planted with elms on each side at intervals of 40 feet for more than a mile. There are 5 public squares of liberal extent, 8 of them having ponds of water. Manchester is the terminus of the Merrimack and Connecticut rivers railroad, and the Manchester and Lawrence railroad. The Concord railroad passes directly through it to Boston. The villages of Amoskeag and Piscataquag are on the W. side of the Merrimack, and were annexed to the city from Goffstown and Bedford in 1855. They have communication with the city by two free bridges.—The rise and importance of Manchester are owing to the manufacturing facilities afforded by its position, the fall in the river being 54 feet in the space of one mile, giving an available

hydraulic power for machinery of the most powerful and extensive kind. The following table shows the principal manufacturing establishments in 1859 :

Name.	Incor- porated.	Capital.	Hands employed.	Articles made.
Amoskeag New Mills.....	1831	\$2,000,000	2,200	Cottons.
" Paper Mills.....	40,000	24	Paper.
" Machine Shops.....	1831	500	Locomotives, &c.
Stark Mills.....	1833	1,250,000	1,250	Cottons and bags.
Manchester Print Works	1839	1,800,000	1,980	Cottons and woollens.
" Gas Light Company	1850	100,000	25	Gas.
" Edge Tool Manufacturing Company	1853	100,000	86	Axes, adzes, &c.
" Iron Company.....	1853	150,000	60	Castings.
" Machine Company.....	1853	300,000	40	Scales.
" Locomotive Works	1854	100,000	200	Locomotives, other en- gines, and tools.
Total		\$6,840,000	7,864	

Of the hands employed, 2,622 are males and 4,742 females. The quantities of the principal articles manufactured yearly are : cottons and woollens, 46,680,000 yards; bags, 2,080,000; paper, 320 tons; locomotives, 90; edge tools, 25,000; castings, 950 tons. The principal kinds of cotton, woollen, and mixed goods are ticks, denims, flannels, sheetings, drillings, de laines, barèges, prints, Persian cloths, and cassimeres. The Blodgett paper mill and Manchester car and machine works suspended in 1857, and have not since resumed operations.—The city contains 14 churches, viz.: 2 Baptist, 2 Congregational, 1 Episcopal, 1 Freewill Baptist, 8 Methodist, 1 Mission chapel, 1 Presbyterian, 1 Roman Catholic, 1 Unitarian, and 1 Universalist. There are 40 public schools, comprising 1 high school, 2 grammar, 1 intermediate, 18 mixed, 8 middle, and 15 primary. The Catholics have a primary school for boys and girls, and "Mount St. Mary's Academy" for the education of young ladies, under the care of the sisters of mercy. The New Hampshire school for the reformation of juvenile and female offenders against the laws is situated on the E. bank of the Merrimack, about 1½ m. N. from the city hall. It is well built of brick, and can accommodate 150 inmates. The "Manchester Athenæum," founded by individuals in 1844, with a library, museum, and reading room, was transferred to the city in 1854 to form the foundation of a public library. In 1856 a fire occasioned the loss of 5,400 volumes. In 1859 it contained 6,500 volumes. There are 5 weekly and 2 daily newspapers, 4 banks of discount with a collective capital of \$750,000, and 8 savings banks.

MANCHESTER (anc. *Mancunium*), the most important manufacturing city in Great Britain, and the second in population, situated in the S. E. corner of Lancashire, on both sides of the river Irwell, in lat. 53° 29' N., long. 2° 14' 23" W., distant by railway 197½ m. N. N. W. from London, 85 m. N. from Birmingham, and 31½ m. E. by N. from Liverpool; pop. in 1851, 401,821; in 1860, estimated at over 500,000. The city consists of Manchester proper and the townships of Ardwick, Beswick, Bradford, Cheetham, Chorlton-upon-Medlock, Harpurhey, Hulme, and Newton, on the E. bank of the Irwell; and of the borough of Salford, composed of Broughton, Pendleton, and Salford, on the W. bank. Eight bridges connect the two towns,

which, though having separate municipal governments, really constitute but one. The Irk and Medlock flow into the Irwell on the Manchester side, and are crossed by several small bridges. The city contains about 800 streets, mostly lighted with gas and generally well paved. They are intersected by numerous canals crossed by about 80 bridges. A portion of the place still presents an antiquated appearance with its old houses and narrow streets; and while the latter characteristic attaches to some of the modernized part, there are many handsome streets, such as Market street, Portland place, Grosvenor square, Mosley street, George street, King street, Ardwick green, Salford crescent, &c. There are several handsome public parks and gardens, of which the most important are the botanical and horticultural garden, the Peel park, on the Irwell, with an area of 82 acres, the Queen's park, Phillips park, and the Bellevue and Pomona gardens; the two latter in private hands, where, in addition to a zoological exhibition in one and a floral exhibition in the other, public concerts and balls are given throughout the summer. The buildings devoted to business and manufactures have generally a very substantial and frequently an imposing appearance. There are nearly 200 places of public worship, of which in 1855 10 were Baptist, 49 Church of England, 22 Independent, 17 Methodist Association, 9 Methodist New Connection, 8 Primitive Methodist, 10 Roman Catholic, 5 Scotch Presbyterian, 5 Unitarian, and 29 Wesleyan. The parish church, erected by Lord Delaware in 1422, and since 1848, when Manchester became a bishopric, the cathedral, is a highly ornamented Gothic structure, now being repaired and beautified, 216 feet long and 120 wide. Of many other handsome churches, one of the finest is St. John's cathedral, Roman Catholic, in Salford, an elegant cruciform structure, with a spire 200 feet high. The town hall, in King street, is in the Grecian style, and contains a hall 180 feet long by 88 feet wide, having its walls and dome covered by allegorical frescoes. The exchange, one of the finest buildings of the kind in the kingdom, has an elegant Doric portico and a splendid commercial room, 185 feet long by 92 feet wide, with 2 rows of fluted Ionic columns, lighted by a lofty glazed dome. In the upper part is a library of 80,000 volumes. The corn exchange is an

Ionic structure capable of holding 2,400 persons. The new free trade hall, somewhat irregular but large and effective, occupies the site of the old free trade hall, noted in the history of Manchester as the place of several important free trade meetings. The new building occupies an area of 20,700 square feet; it contains a hall 128 feet long and 78 feet wide, with an area of 9,594 feet, and estimated to afford accommodation for 3,156 persons, and with the galleries for 4,000. There are beside various rooms for concerts, supper, cards, billiards, &c. Its front is 75 feet high. There are various other notable public buildings, court halls, gaols, the blind and the deaf and dumb asylum, and the royal infirmary, established in 1752. The last named edifice is one of the most ornamental in the town. It is in Piccadilly, built on 3 sides of a quadrangle, each with a portico supported by 4 fluted Ionic columns, the whole surrounded with grass borders and walks, with a sheet of water in front. A colossal statue of Sir Robert Peel faces the building. Among scientific, literary, and art associations are the royal Manchester institution, occupying buildings which cost £40,000, and devoted to the exhibition of paintings, lectures, &c.; the mechanics' institution, founded in 1825, for which a new edifice was erected in 1856, established for the instruction of the working classes, male and female, in the principles of the arts they practise and in other branches of useful knowledge; a school of design, founded in 1838 for the purpose of imparting instruction in design as variously applied to the arts, to provide lectures on painting, sculpture, anatomy, &c., to form a library of books and engravings, and a museum for the exhibition of casts, models, designs, paintings, mechanical inventions, and other works of arts; also natural history, botanical and horticultural, geological, statistical, and medical societies. There are many public libraries, of which two are free, viz.: the free library, so called, founded by voluntary subscription and maintained by a municipal rate, and that attached to Chetham's hospital, or the "college" as it is now simply called, an institution founded in 1651 by Humphrey Chetham, for the education of poor boys. Owen's college, founded in 1851 by the munificence of a merchant of the city, who bequeathed for the purpose a property amounting to £100,000, is in connection with the university of London. In 1853 it had 99 students. Beside the colleges there are the free grammar school founded by Hugh Oldham, bishop of Exeter, in 1515-'25, the royal Lancasterian school, and several national schools in which instruction is almost or quite gratuitous. Manchester supports two theatres, and a large concert hall. It is supplied with water from a "gathering ground," about 24 m. distant, of nearly 20,000 acres. The reservoirs form a series of 10 artificial lakes of a capacity of 600,000,000 cubic feet. The pure water only is supplied to the city, the turbid water being collected in separate reservoirs and used for mill purposes. The water is conveyed

in aqueducts 12 m. to Godley, thence to two reservoirs at Denton, and thence 4 m. to Manchester. The works are capable of furnishing 25,000,000 gallons daily, and their cost was about £1,500,000. Manchester is the centre of a great system of canals, and has railway communication with nearly all parts of England.—The name of the town has from a very remote period been connected with industry and trade; but its present great importance is specially due to the magnitude of its cotton manufactures, the greatest in the world. It is mentioned as having maintained a trade with the Greeks of Marseilles. In 1552 an act was passed for the better manufacture of "Manchester cottons;" and in 1650 its manufactures ranked among the first in extent and importance, and its people were described as "the most industrious in the northern parts of the kingdom." Toward the middle of the last century the supply of cotton goods became unequal to the demand. This stimulated that intellectual activity which ultimately removed the previous apparent limits of human industry beyond the bounds even of conjecture. The machines successively invented by Leigh, Hughes, Arkwright, Hargreaves, and others, had their efficiency vastly increased by the steam engine of Watt. The value of the exports of the cotton industry in 1780 was £355,060; it rose in 1781 to £1,101,457, and in 1856 it had reached upward of £88,000,000. The imports of raw cotton in 1751 were to the amount of 2,976,610 lbs.; in 1780, upward of 6,700,000; in 1800, 56,000,000; and in 1856, 1,000,021,021,000. Connected with the cotton manufacture are many important and extensive branches of industry, such as bleaching, printing, and dyeing works, manufactures of the various materials employed in those processes, and particularly the great establishments for the construction of steam engines and machinery, among which may be mentioned the very extensive works of the Fairbairns. It is also the chief market in the world for the production of cotton yarn or thread, the supply of which passes through the hands of numerous resident foreign merchants, who export it to their respective countries, giving to Manchester in this respect a character quite unique among inland cities. The manufacture of silk and silk goods, and of mixed cotton and silk fabrics, is also largely carried on. The following table, furnished in 1858, gives the latest information concerning the factories and print works:

The Manchester exhibition, intended for the display of the art treasures of the kingdom, was opened on May 5, 1857. The idea originated at a meeting of Manchester gentlemen in May, 1856. Public approval immediately encouraged the scheme, and a guaranty fund of £74,000 was raised within 8 weeks. The queen and Prince Albert gave the enterprise their patronage and assistance, and the owners of works of art, with few exceptions, responded cheerfully to the application. A suitable building for the exhibition was erected on a site covering 17 acres in Old Trafford, adjoining the botanical gardens, and about 2 m. from the centre of the city. The structure itself covered an area of 180,000 square feet, and cost over £30,000. The central hall was 682 feet long and 104 feet wide; the side aisles were 432 feet long by 40 feet wide; and a water color gallery at the W. end was 200 feet by 24. The light, which was ample and equally diffused, was in all the halls admitted from the roof. There were exhibited 1,115 paintings, 689 by modern masters, 888 British portraits, 59 cases of miniatures and enamels, 969 water color drawings, 160 specimens of modern sculpture, 260 original sketches and drawings by the old masters, 937 line engravings, 161 mezzotints, 246 etchings, many woodcuts, plain, tinted, and chromo-lithographs, and about 600 photographs. The museum of ornamental art comprised 17,000 articles, remarkable for value, beauty, or rarity. No similar collection made in England ever approached this in extent and value. It remained open a little over 5 months, and was finally closed Oct. 17, 1857. During that period it received 1,835,915 visits. The receipts from all sources were £98,500, and the entire outlay, including the expense of returning the various articles to their owners, was £104,000, being an excess of £5,500, to meet which were the materials of the building, since demolished, estimated as worth about £15,000. —The site of Manchester is mentioned as a chief station of the druids, who had there an altar called Meyne. In A. D. 500 it was an unfrequented woodland. In 620 it was taken by Edwin, king of Northumbria, and shortly after occupied by a colony of Angles. It then passed to the Danes, who about 920 were expelled by the king of Mercia. The charter conferring the privileges of a borough was granted in 1301. Manchester cotton is first mentioned in 1352, by which was meant, however, a coarse woollen cloth woven from unprepared fleece. In 1579 the manor was sold to John Lacye, a London cloth-worker, for £3,000, and resold in 1596 to Sir Nicholas Mosley for £3,500. At the time of the civil war it was distinguished for active industry, and suffered much from both parties. On Jan. 8, 1819, a great radical meeting was held at St. Peter's field; and another great meeting, attended by 60,000 persons, on Aug. 16 of the same year, was dispersed by the yeomanry cavalry after killing 8 persons.

MANCHINEEL (*Hippomane mancinella*), a poisonous evergreen tree growing wild in the

West India islands and along the shores of the Caribbean sea. It is of the natural order *euphorbiaceae*; and the name *hippomane* (Gr. *ἵππος*, horse, and *μανομαι*, to be mad) is given to the genus from the supposed maddening effect of its juice upon horses. The Greeks applied the name originally to an animal substance. The manchineel tree grows to the height of 80 or 90 feet; it has a smooth brownish bark, and spreads out into many branches. The leaves are about 8 inches long and half as wide, standing on short footstalks; the flowers grow in short spikes at the end of the branches. They are obscure and without petals. The fruit when ripe is of a yellow color, and resembles in size and shape the golden pippin. It is highly poisonous, inflaming the mouth and throat when tasted; and the milky juice which exudes from the wood when this is cut is also exceedingly acrid, blistering the skin it touches and acting like lunar caustic when applied to linen. On account of the beauty of the wood when polished, it is much used for cabinet work. It is stated that before striking the axe into the trees the workmen take care to dry the wood by lighting fires around; and cabinet makers also when working it protect their faces with veils from the poisonous effects of the saw dust and exhalations from the wood.

MANCINI, LAURA BEATRICE OLIVA, an Italian poetess, born in Naples in 1823. She devoted the early part of her life to her invalid father, to whom she was indebted for her education. In 1840 she married, against the wish of her relatives, the jurist Pasquale Mancini, and she wrote a play entitled *Ines* founded upon the romantic circumstances of this alliance, which was performed in Florence in 1845. In 1846 appeared her poem *Colombo al convento della Rabida*, and a volume of miscellaneous poetry. Her husband was implicated in the revolutionary movements of 1848, and she followed him to Turin, where she has since resided. In 1851 she addressed a poem to Mr. Gladstone in gratitude for his revelations in regard to the Neapolitan government; and one of her finest poems was elicited by the death of Gioberti (*L'Italia sulla tomba di Vincenzo Gioberti*, Turin, 1853).

MANCO CAPAO. I. In Peruvian mythology. (See INCA.) II. Inca of Peru, killed in 1544. He was the second son of the inca Huayna Capac, the conqueror of Quito, who died about 10 years after the first arrival of the Spaniards, dividing his kingdom between his legitimate successor Huascar and a younger son Atahualpa. The latter, after having made war upon Huascar and put him to death, was himself captured and executed in 1533 by Pizarro, who then set up Toparca, a brother of his victim, as a nominal sovereign, under whose name the conquerors might themselves direct the government. Toparca died within the year, and shortly afterward Manco appeared in the Spanish camp to announce his pretensions to the throne and claim Pizarro's protection. The conqueror received him cordially, and made it his

first care after the taking of Cuzco to place him on the throne. But it was soon evident that the young prince would be no puppet in the hands of his patron. After in vain petitioning for power to exercise the sovereignty, he withdrew secretly from Cuzco, but was overtaken, brought back, and imprisoned. Again escaping, he roused the whole nation to arms against the invaders, and appeared before Cuzco (Feb. 1536) with a countless host of Indians who covered the surrounding hills. He destroyed a large part of the city by fire, and reduced the Spaniards to extremities; but after the siege had lasted over 5 months, he had to draw off most of his followers on account of the scarcity of food, and retired to the fortress of Tambo in the valley of the Yucay. Defeated here by Almagro, and forsaken by most of his warriors, he fled to the Andes, and for several years remained a terror to the Spaniards, hovering over their towns, lying in ambush on the highways, rallying forth as occasion offered at the head of a few brave followers, always eluding pursuit in the wilds of the Cordilleras, and in the event of civil war among the foreigners throwing his weight into the weaker scale in order to prolong their contests. Pizarro attempted to negotiate with him, and sent him rich presents by an African slave. The negro was murdered on the way by some of Manco's men, whether by the inca's order or not was unknown; and Pizarro in revenge caused one of the monarch's wives, a young and beautiful woman, to be tied naked to a tree, scourged, and shot to death with arrows. The Spanish rulers who succeeded Pizarro, down to Blasco Nunez, bore orders from the crown to conciliate the formidable chief, but he refused all offers of accommodation. He was killed by a party of Spaniards belonging to the younger Almagro's faction, who on the defeat of their leader had taken refuge in the Peruvian camp. They were in turn massacred by the Indians, and it is not known on whom the blame of the quarrel should be cast.

MANDAMUS, the name of a remedial writ, belonging to a once extensive class of precepts, which bore the generic name of mandamus. They derived their name from the significant word of the mandatory clause, which, while the writs were framed in Latin, ran: *Nos igitur tibi mandamus, &c.*—"We therefore command you." Their origin is referred to that clause of Magna Charta which declares that to no man will the king refuse or delay justice: *Nulli negabimus aut differemus justitiam vel rectum*. At a very early period, the injunction was in form nothing but a letter from the sovereign. Subsequently it became a parliamentary writ, and issued on petition from the king and his council. Now, issuing in the name of the sovereign from the court of king's or queen's bench, the writ is directed to persons, corporations, or courts of inferior judicature, and requires them to do some specific act which belongs to their official duty, or which exact justice demands. As in England the precept proceeds from the

court which immediately represents the king, so in this country the power to grant it is vested in the supreme judicial authority of the state. Not only does it form a branch of that general supervisory control which the sovereign power must possess over tribunals, magistrates, and all indeed who in any sense are invested with public functions; but also, as it was originally contrived to prevent failure of justice and to remedy defects of police, it is to be awarded in cases for which the law affords no specific and adequate remedy, yet where justice requires that there should be one. By the judiciary act, which was framed upon the provisions of the constitution, the U. S. supreme court received power to issue writs of mandamus in cases warranted by the principles and usages of law "to any courts appointed or persons holding office under the authority of the United States." Afterward, however, upon construction of the act, the latter clause was held to be unconstitutional and void, and the supreme court refused to grant the writ to compel the secretary of state to deliver a civil commission alleged to be illegally withheld by him. Under the former clause the jurisdiction of mandamus over the circuit and district courts has been repeatedly exercised. Circuit courts, too, have authority to issue the writ when it is necessary for the exercise of their jurisdiction, as, for example, to compel a district court to proceed to judgment in a case which may be referred to the appellate judicature of the circuit court, or to require a state court to transfer a cause to the circuit court under the acts of congress.—In the several states, the power to award the writ of mandamus generally resides in the highest court, and is exercised at discretion. He who seeks this remedy must show that he is innocent of laches, that he has a clear right in the premises, that there has been a distinct refusal to do that which the petitioner would compel, and finally that he has in the ordinary processes of law no adequate remedy, either by statutory provision, by writ of error, or by indictment. It is for the court to determine whether or not, upon the record, mandamus is the proper remedy, as well as whether the allegations are sufficient to authorize the writ. By the usual practice, the person, body corporate, or tribunal to which the writ is directed, is required to make a return to it. The party at whose instance the writ issued may then either demur to or traverse the material facts of the return. The party making the return may himself demur or traverse, and the issue finally produced is to be tried according to the usual course of procedure. If the applicant maintain the issue, he recovers his costs, and a peremptory mandamus is awarded. In a very clear case the peremptory writ may issue in the first instance. As it is directed to courts, the proper office of the mandamus is to require a tribunal of special, peculiar, or inferior jurisdiction to take cognizance of a case which is properly brought before it. The higher court merely

sets the lower in motion; it bids it exercise the power which is vested in it. It does not presume to revise the decision of the inferior tribunal, nor does it interpose to direct or correct the exercise of any discretionary power which belongs to it. As examples of this jurisdiction, mandamus has been granted to compel the sealing of a bill of exceptions; the granting of a new trial; the amendment of a bill of exceptions according to the truth of the case; or, at suit of a defendant, to require the inferior court to enter judgment upon a verdict, in the regular course of process, in order to enable the defeated party to bring his writ of error. But the writ does not lie to control courts in respect to matters of practice under their rules, or to control an exercise of their discretion, as, for instance, in permitting amendments or in refusing to grant motions. Mandamus often issues to commissioners of highways and supervisors of counties, commanding them to perform the peculiar duties of their office; ordering them, for example, to open a road regularly laid out; to estimate the damages caused by the construction of a railway through the county; or to levy a tax as they were required by law to do for the payment of damages caused by laying out a highway. Corporations, too, are often commanded by this process to do what their constituent acts require, or to admit members to the privileges to which they are entitled upon general principles of right. Thus railway corporations have been compelled to pursue, in crossing rivers, the mode prescribed in their charters, and have been forbidden to obstruct navigation by the location of their track. Mandamus will also be issued to a former town clerk, or to a clerk of a county, or to a treasurer of a religious society, requiring him to deliver to his successor the common seal, and the books, papers, and records of the corporation. So it has been directed to the proper officers or body of a corporation, commanding them to restore a member who has been disfranchised without notice or opportunity to make his defence; to admit as a member one who is entitled to become such; and to permit a director to inspect the corporation books. As a remedy for the enforcement of mere private rights of property, mandamus is restricted to cases for which there is no adequate remedy by action in the due course of the common law. A private individual can have the writ only when he has some particular interest to be subserved or right to be pursued or protected by aid of this process, independent of that which he holds in common with the public at large. He therefore cannot claim mandamus to compel a public board to perform an omitted duty unless he is directly injured by the non-performance. Yet such an application from a private individual might perhaps be entertained if the public prosecuting officer had refused to act. It has been lately held in New Jersey that a supreme court has no power to award mandamus either to compel the execution of any duty enjoined on the

executive by the constitution, or to direct the manner of its performance.

MANDANS, a tribe of Indians in the territories of the United States, whose principal village was on the Missouri in lat. $47^{\circ} 20'$ N. They are now extinct, having all died of the small pox within a few years. They were a branch of the Dacotaha, and were discovered by Lewis and Clark in 1805. Mr. Catlin, who visited them not long before their extinction, describes them as very different from other Indians in appearance. He says: "There are a great many of these people whose complexions appear as light as half-breeds; and among the women particularly there are many whose skins are almost white, with the most pleasing symmetry and proportion of features; with hazel, with gray, and with blue eyes; with mildness and sweetness of expression and excessive modesty of demeanor, which render them exceedingly pleasing and beautiful. Why this diversity of complexion I cannot tell, nor can they themselves account for it; their traditions, so far as I have learned them, afford us no information of their having had any knowledge of white men before the visit of Lewis and Clark made to their village 83 years ago. Since that time there have been but very few visits from white men to this place, and surely not enough to have changed the complexions and customs of a nation."

MANDARA, an independent kingdom of central Africa, S. of Bornoo. It consists of a well watered valley surrounded by the Mendify mountains, some of whose summits rise to the height of 8,000 feet. The soil is fertile, and produces the *gobberah*, a species of fig tree remarkable for its great size, the ordinary circumference of the trunk being 86 feet. There is also a peculiar tree bearing a white and fragrant blossom resembling the seringa. Tamarind and mango trees are also common. Leopards and panthers abound in the woods, and the country is infested by scorpions, and by the *liffa*, a peculiar species of venomous serpent. There are 8 towns in the valley, the chief of which is Mora, the capital. The people are Mohammedans, and are ruled by a sultan, whose body guard consists of 500 cavalry. They are negroes with well formed features, and are lively and intelligent. They cultivate cotton, and manufacture iron with considerable skill. The mountains around Mandara are inhabited by pagans, who hold the Mandaran sultan in great dread, and frequently send him tribute. The country was visited in 1828 by Major Denham; and in 1851 Dr. Barth accompanied a Bornooese warlike expedition against Mandara, at whose approach the sultan submitted to the authority of the sultan of Bornoo.

MANDARIN (Port. *mandar*, to command), a term used by Europeans to designate Chinese and Cochinchinese government officers. It is much less employed than formerly, and the best recent writers on China do not use it at all, as the English word officer fully expresses its meaning.

MANDATE, a law term derived from the Roman civil law. It may be defined as a bailment (delivery) of a chattel or chattels to a person who is to do something with or about the things bailed, entirely without compensation. The essential element of the contract lies in the fact that there is not paid or promised, in law or in fact, any compensation whatever for the service to be rendered. The person delivering the chattels is called a mandator; and the person receiving them and undertaking the service is called a mandatary. As it must be a service or an act, the whole benefit of which rests with the mandator, this, by the ordinary principles of bailment, determines the amount of care to which the mandatary is bound, and the degree of negligence for which he is answerable. For negligence in a bailee has in law three degrees: slight negligence, which makes the bailee responsible where the bailment was wholly for his benefit; ordinary negligence, for which he is responsible if the bailment be for the benefit of both parties; and gross negligence, for which only the bailee is responsible where the contract is for the exclusive benefit of the bailor. And as it is not a mandate if the bailee derives any benefit whatever from the service, it follows that a mandatary is responsible for loss of or for injury to the thing delivered to him, only when it is caused by his gross negligence.—There is no especial form for the contract of mandate; it may be in writing or by word only, and made very solemnly or in the simplest way; in either case the law is the same. The mandator may recall the thing delivered at any time, and so rescind the contract. But if the nature of the contract be such, that a mandatary has rendered the service in part, and will himself suffer detriment if it be not completed, the mandator cannot now rescind it without providing adequate indemnity to the mandatary. When the contract is lawfully dissolved, the chattel must be restored to the mandator; but if indemnity be due to the mandatary, he would have a lien on the chattel to secure it. So too the contract would be dissolved by the death of the mandator or of the mandatary, or by any change in the state of the parties which from its nature would recall it; as by insolvency of either party, or insanity, or the marriage of a woman, or the sale of the property, or the termination of a guardianship on which the mandate rested. But in all these cases there must be the same exception as to a service partially rendered. So, too, it would seem that the mandatary may at his own pleasure terminate the contract; and as he may do this at any time, he may do it before he has begun to perform the service at all. But this very question has been more frequently and more elaborately discussed than any or all others which have arisen out of the contract of mandate. Chancellor Kent, in a case which came before the supreme court of New York when he was chief justice (4 Johns. 84), cited and considered an immense number of authorities bearing upon the law of mandate. And

yet the case itself was not a case of mandate, unless the definition above given, which rests on the authority of civilians and common law writers, be changed in an important respect. It was the case of a defendant who, being requested by the plaintiff to cause his vessel to be insured, promised to do this, and repeated the promise emphatically, and the plaintiff relying upon it effected no insurance. The vessel was lost, without insurance; and the defendant being called upon to respond for his negligence, the court treated the case as one of mandate. But here, nothing whatever was delivered to the defendant. He was not a bailee in any sense of the term. But the court applied to him the law of mandate, and held that he could not be made to answer for not doing the thing requested and promised, because, as he was to have no compensation, the promise was gratuitous, or without consideration, and therefore not binding. Many cases turn upon this question; and some uncertainty has been introduced by confounding the principles which should be applied to cases arising from contract, and those which belong rather to cases of wrong or trespass. We cannot doubt that the principles of law, applicable in either case, are quite clear. If a mandatary in the proper sense, that is, a bailee of some article with or about which he is to do something, receives it, and takes it away from the bailor and owner and into his own possession, here is a contract, and it is one which is founded upon a sufficient consideration. The mandatary promises to do a certain thing; and thereupon the mandator delivers to him certain property, and deprives himself of the power of getting the service rendered by some other person. The mandatary is therefore bound by his promise; and whether he performs it in part only, or neglects it altogether, he is liable; only, however, when his negligence be gross, and loss or injury spring from it, because the principle which runs through the whole law of bailment applies here also, and the consideration consists only of injury to the mandator and not of benefit to the mandatary; for a contract beneficial to one party only throws on the other no responsibility but for gross negligence. But if one who is in no sense a bailee, and therefore in no exact sense a mandatary, fails in performing a promise he has made without consideration, he is not answerable, on his promise, for any consequences. It is said, however, by some authorities, that if he begins his service, and leaves it half performed, he is liable on the promise. This we cannot admit. The law we believe is this: No man can be held in England or in the United States (except in Louisiana, where the common law does not prevail) for a breach of any promise, whether that breach be partial or total, if the promise rests upon no consideration. But if he who has made a promise, afterward does some injury to the promisee (and this would be the case if he does something which is positively injurious because it is not completed), he is liable for the injury

he has caused, as he would be if there were no promise between the parties.—Banks and bankers are so far mandataries, that they receive notes for collection, and render, or engage to render, by agreement or by mercantile usage, these and similar services without any especial or specific compensation. But it is understood that they do this as a part of their business, and for the general and indirect benefit they derive from doing it; and this is undoubtedly consideration enough to make them liable for any injury to their customer caused by their negligence; and it is sufficient to make them liable that their negligence was ordinary, or consisted in the want of common care. And a bank has, as bailee, a lien on its deposits for its general balance against the depositor.—We have seen that a mandatory is, by law, liable only for gross negligence. But it is a voluntary contract, and the parties may vary it in any way, and make it more or less stringent, at their pleasure. Where the parties enter into no specific stipulations, there the law sometimes varies their liabilities in accordance with the particular circumstances of the case. Thus, it is an obvious principle, that the mandator has no right to require any more skill or care than he has reason to expect. If an owner of a valuable chronometer carry it for repair to an ordinary watchmaker who does no business of this kind, and the instrument be injured in his hand because no more care and no better skill were applied to it than would suffice for ordinary watches, the owner has no one to blame but himself; unless he can show that the watchmaker especially undertook to be able to do the work required, and that the bailor had no means of knowing his incompetency. On the other hand, if the owner intrusted his instrument to a person who was known to deal with those of like kind, who professed this as his business, and expressly or by implication asserted himself to possess sufficient skill, this person would then be liable, as for gross negligence, if he did not possess the requisite skill, or did possess it but did not make use of it, although he was strictly a mandatory, and had undertaken the work gratuitously. Here, however, a distinction must be taken. If a workman who is paid for his service asserts himself to have sufficient skill, he is liable for injury resulting from the want of that skill, although he does his best. But if he is not paid for his service and makes the same assertion, he is now not liable merely for the want of it unless he made the assertion fraudulently and knowing its falsehood; but, however honest, he is liable if, beside a want of skill, he has been guilty of negligence.—Mandates in the civil law were the orders of the high functionaries, as the consuls and proconsuls, and afterward the emperors, to subordinate officers, to instruct them as to the conduct they should pursue, either in general or in particular cases.—At common law, the word mandate can hardly be said to be known. But it is sometimes used to signify an official command issued

by a court, or a magistrate, or any tribunal having authority, in the form of a writ or precept. It is generally, if not always, confined to commands issued to an inferior court, to confirm or set aside a judgment, as by the supreme court of the United States to a circuit court, or to a proper officer, to enforce or execute a judgment, decree, or order. When the command is issued to an individual who is a party before the tribunal, it is more commonly known as an injunction, prohibition, or the like.

MANDELAY, a new city, capital of the kingdom of Burmah, 8 m. from the Irrawaddy river and 600 m. above Rangoon; pop. in 1858 said to be about 800,000. In 1856 its site was occupied by cultivated fields; but after the royal determination to select a new capital, its erection was carried forward so rapidly that by July, 1857, it was ready for the reception of the court. It is defended by a wall of earth 16 feet high, which is to be strengthened by a facing of brick and a deep trench. The streets, which cross each other at right angles, are over 100 feet wide, and the principal thoroughfares are macadamized. Along their sides run narrow channels for carrying water through the city. In the centre a temporary palace was erected, and a new one, surrounded by a brick wall 6 feet thick, was among the earliest works undertaken. The houses are built with great uniformity, and are generally spacious. The city is laid out in the form of a square, the S. quarter being occupied by domesticated Chinese, and the W. by foreign residents. Outside of the walls several flourishing suburbs have sprung up, presenting ranges of well built teak and bamboo houses, and traversed by excellent public roads. Water is obtained from the river by a canal, which to obtain a proper level has to be carried a distance of 16 m.—Postal communication with Rangoon is kept up by dak boats, which leave Mandelay every 10 days, and make the voyage in 8 days. The king also owns 9 steamers which navigate the river when the depth of water is sufficient. Steam pumps have been set in operation to irrigate the adjacent fields, and every inducement is offered by the court to European mechanics and engineers to establish themselves in the new city.

MANDEVILLE, BERNARD DE, a Dutch physician and author, born in Dort about 1670, died in London, Jan. 21, 1733. He practised medicine without much success in London, and wrote "The Fable of the Bees, or Private Vices Public Benefits" (1723-'28), a philosophical satire on human nature, and other works.

MANDEVILLE, SIR JOHN, the earliest English prose writer, born in St. Albans about 1300, died in Liège, Nov. 17, 1372. He was a proficient in theology, natural philosophy, and medicine, and even practised as a physician for some time. In 1327 he proceeded to the East, and visited the holy places in Palestine, being favored by the sultan of Egypt, as also by the khans of Cathay, and travelled in Armenia, Persia, India, and Tartary. He returned to England in 1331.

and wrote a narrative of his travels and adventures, first in Latin, and afterward in French and in English, which he dedicated to Edward III. This work is a singular mixture of fact and fable, a monument at once of the author's candor and credulity. The earliest edition of it is that of Wynkin de Worde (Westminster, 1499), and the best edited by O. Halliwell (London, 1839).

MANDINGO, a country in W. Africa, bounded N. by Fooladoo, E. by Bambarra, S. by Gallonadoo, and W. by Gadoo, lying between lat. 10° and 14° N., and long. 6° and 10° W. Much of this region is a high table-land, and contains the sources of the Senegal and the Niger. Iron is abundant in the mountains, and gold dust is found in the rivers. The country is divided into a number of small republics, each of which is nearly independent of the others. The most considerable of these states are Manding, Bambook, Bondoo, Dentilia, Saloom, Barra, Wooly, and Yarra. The capital is Kamalia.—The inhabitants, who are called Mandingos, are remarkable for their industry and energy. They are mostly zealous Mohammedans. The principal trade of that part of W. Africa which lies between the equator and the great desert is in their hands. They are not only active and shrewd merchants, but industrious agriculturists, and breeders of a good stock of cattle, sheep, and goats. They are black in color, tall and well shaped, with regular features and wavy hair. In character they are amiable and hospitable, imaginative, credulous, truthful, and fond of music, dancing, and poetry. They are adventurous travellers, extending their commercial journeys over the greater part of Africa. They trade chiefly in gold, ivory, and slaves. Polygamy is practised, and each wife has a separate hut. Their language is the richest of the negro tongues, is widely spread, and is written in Arabic characters. The Mandingos are the most numerous race of W. Africa, and have spread themselves to a great distance from their original seat, being found all over the valleys of the Gambia, Senegal, and Niger.

MANDOLINE, an Italian musical instrument now little used, resembling the old *mandola*, a small lute, of which name the word is the diminutive. It was furnished sometimes with gut strings and sometimes with metallic ones, and was played by means of a quill or piece of wood.

MANDRAGORA. See **MANDRAKE**.

MANDRAKE (*mandragora officinarum*, Mill.) a stemless plant, with lanceolate leaves, growing beneath them several pale violet-colored flowers, and having a large, forked, fleshy, perennial root. It grows spontaneously in the south of Europe. The plant belongs to the natural order *solanacea*, which comprises many poisonous and deadly species. It was once called *hyps mandragora*, and it is considered more poisonous and dangerous than the deadly nightshade or dwale (*atropa belladonna*). Its root, which is large, is often divided into 2 or 8 forks,

which have caused it to be likened to the shape of the human body, a circumstance attaching to it a reputation of being endowed with animal feelings; and there are fabulous stories of its uttering shrieks when torn from the earth. Sibthorp (*Flora Græca*, London, 1806-'40) says that the young Greeks wear small pieces of the root about them to serve as love charms; and among the ancients it was held in high repute for philters. The qualities of the mandrake are acro-narcotic, purgative, and aphrodisiac. According to Lindley, Dr. T. H. Silvester has shown that the root was formerly used in the same way as chloroform and other anæsthetic agents now are. The mandrake of the Old Testament (Gen. xxx. 14, 15, 16, and Canticles vii. 13) was thought, according to some commentators, to have the power of removing barrenness.—The American May apple (*podophyllum peltatum*, Linn.) is sometimes called mandrake, but is in no way related to the mandrake of the ancients. It is, however, a poisonous plant in its leaves and roots, the latter being a violent purgative, and resembling calomel in many of its effects.

MANES. See **MANICHÆANS**.

MANES, in Roman mythology, the souls of the departed, who were generally recognized as gods and propitiated by sacrifices at certain seasons called *feriæ denicales*, and more particularly at an annual festival kept on Feb. 19 under the name of *ferialia* or *parentalia*, when each person made offerings to the souls of his deceased parents and benefactors. The manes were believed to have power on earth only by night.

MANETHO, an Egyptian historian, who flourished in the reign of Ptolemy Soter, at the beginning of the 3d century B. C. He was a priest of Sebennytus in Lower Egypt, and wrote in Greek a work on the religion and another on the history of his country, the title of the former being *Τῶν Φυσικῶν Επιστολῆ*, and of the latter *Αἰγυπτιακά*. Both books are lost, but numerous fragments have been preserved by Josephus, Julius Africanus, Eusebius, and by Syncellus, who compiled from the two latter. The list of the Egyptian dynasties, as preserved in the Armenian version of Eusebius, is the most valuable remnant of Manetho's history, the dates of which appear to have been derived from genuine documents, including the sacred books of the Egyptian priests. Attacked as a fabulist by various critics, Manetho has found zealous defenders among the most distinguished Egyptologists, and the recent discoveries in hieroglyphic archæology have served more to strengthen than to weaken his authority; but parts of the fragments are now generally acknowledged to be spurious, as is the astrological poem *Αποτελεσματικά*, which bears his name, but is a work of late date.

MANFRED, prince of Tarentum, king of the Two Sicilies, natural son of the emperor Frederick II. and of Blanca, a daughter of Count Lanza of Lombardy, born in Sicily about 1231,

fell in the battle of Benevento, Feb. 26, 1266. At his father's death in 1250 he was appointed regent in Italy during the absence of his half brother, Conrad IV., the legitimate heir. Pope Innocent IV. immediately excommunicated him, declaring that the house of Swabia had ceased to rule over Sicily, because Frederic II. had died under the papal ban. Insurrections were excited in Capua, Naples, and other cities, but Manfred reduced most of the rebels, advanced to meet Conrad at Pescara, delivered the government into his hands, and aided him in completely suppressing the revolt. He was, however, removed from any part in the administration, his principality of Tarentum was taxed, and the Lanzias were exiled from it. Conrad died suddenly in 1254, leaving the crown to his infant son Conradin, and Manfred was again called to the regency. Innocent IV. renewed his opposition to him, supported by the Guelph party in the Two Sicilies, forced him to agree to hold his possessions as an immediate fief of the holy see, and had demanded from him an oath of entire submission, when he made his escape to the Saracens at Lucera. Aided by them, he defeated the papal troops at Foggia, recovered Apulia, and after the death of Innocent was recognized king of the Two Sicilies, and crowned at Palermo (Aug. 11, 1258), a report of Conradin's death in Germany being at that time spread through Italy. This report was immediately contradicted by envoys, but Manfred refused to resign the crown, and his bravery, handsome person, accomplishments, and success made the people willingly submit to his rule. Regarded as the hereditary protector of the Ghibellines, he sent troops to Tuscany, by whom the Guelphs were defeated at Montapertosa. His court abounded with poets and artists, and he himself was noted for poetic skill. He enjoyed a short release from the papal enmity under Alexander IV., but was excommunicated by Pope Urban IV., who offered his kingdom for sale to any European prince who had the strength to take it. Charles of Anjou, brother of Louis IX. of France, accepted the offer in 1264, was solemnly crowned by Pope Clement IV. at Rome in 1265, and marched thence for the conquest of the kingdom of the Two Sicilies. He was met by Manfred beneath the walls of Benevento. The latter was bravely supported by the Saracens, but the Apulians refused to advance against the enemy, the Sicilian army was thrown into disorder, and Manfred fell covered with wounds in the thickest of the battle. Dante alludes to his death and to his interment without religious rites (*Purgatorio*, canto iii.). He was twice married, first to Beatrice of Savoy, and next to Helena, a Greek princess, and left 8 sons and one daughter, who became the prisoners of the victor.

MANGANESE, a metal, the peroxide of which was known long since in the mineral used for decoloring glass, and now called pyrolusite; symbol Mn; chemical equivalent 27.5 (Von Hauer). The mineral was confounded

with the magnetic oxide of iron, and called *magnesia nigra*, until Pott in 1740 showed that it often contains only mere traces of iron. In 1774 Scheele and Bergman described it as a peculiar earth, and Gahn afterward obtained from it a new metal which he called magnesium. For this name, which was subsequently applied to the metallic base of magnesia, the terms manganese, manganium, and manganese have all been substituted, the last being now in common use. Manganese is not found native, but is reduced from its oxides by subjecting these in a finely pulverized state and mixed into a paste with oil at an intense heat in a close crucible; the button of metal obtained by this method soon tarnishes on exposure, absorbs oxygen, and falls to a brown powder. It decomposes water, and to be kept must be in a hermetically sealed tube or in naphtha. The metal is hard and brittle, resembling cast iron in its color and granular texture; but it is exceedingly difficult of fusion, and when pure is not magnetic. Its specific gravity is variously given from 6.85 to 8.01. It accompanies iron; and the ores of one of these metals almost invariably present traces of larger quantities of the other. There are various points of resemblance between the 4 metals, manganese, iron, nickel, and cobalt, and the modes of occurrence. Their equivalents also succeed each other in the following order: 27, 28, 29, 30, those of the last two being thus determined by late researches of Schneider. (**NICKEL**.)—A communication was made in 1817 by M. Brunner to the French academy of sciences, setting forth some new features in the qualities of manganese as prepared by his method, which was to treat the ores as the oxide of aluminum are treated in obtaining that metal. A crucible is charged with alternate thin layers of fluor spar, carbonate of soda, and manganese ore; twice as much fluor spar as soda being used. The mixture is covered with a quantity of dry common salt, and this with coarse fluor spar, which serves to keep the rest in the crucible during the violent action which ensues. The crucible, being covered, is exposed to a low heat which is gradually increased to a bright red. A hissing noise is heard, and a yellow flame is seen issuing from the crucible. In a quarter of an hour the furnace may be closed for the metal to go down, and when the crucible is taken out and broken, a button of manganese is obtained from the bottom. If thorough fusion has not taken place, the contents of the crucible should be broken up in a steel mortar and again fused with dry common salt, or dry potash with a tenth part of nitrate of potash. Borax is not a good flux, as it injuriously affects the quality of the metal. The manganese thus obtained has a color like that of cast iron; it is very brittle, being easily crushed into fragments, and so brittle that it resists the hardest steel instrument. It takes a most beautiful polish, which is not altered by exposure for months to the vapors of a laboratory. When heated on a sheet of platinum it undergoes changes of color like those

steel similarly treated, and finally becomes brown from the coating of oxide which forms upon it. The specific gravity of the metal is from 7.188 to 7.206. It is not attracted by the magnet. It is dissolved in nitric, sulphuric, hydrochloric, or acetic acid. The hardness of the metal renders it suitable for various mechanical purposes. An angular piece of it may advantageously be used instead of a diamond to cut glass, and even to work steel and other metals. The polish which it is capable of taking renders it applicable for the mirrors of optical instruments. Although it cannot be wrought, it may be cast into moulds as easily as iron. It may be used by engravers and steel manufacturers, and will probably be made available for many other purposes in the arts and sciences, either alone or alloyed with other metals.—The compounds of manganese and oxygen are 7 in number, 2 of which are intermediate or compound oxides. They are: protoxide or manganous oxide, MnO ; sesquioxide or manganic oxide, Mn_2O_3 ; bioxide or peroxide, MnO_2 ; manganoso-manganic oxide or red oxide, Mn_3O_4 , or $MnO + Mn_2O_3$; varvicite, Mn_4O_7 , or $Mn_2O_3 + 2MnO_2$; manganic acid, MnO_3 ; and permanganic acid, Mn_2O_7 . The first is the base of the ordinary salts of manganese, and is interesting for its frequent occurrence in mineral compounds, and the isomorphism of its salts with those of magnesia and others of its class, which it frequently replaces. The red oxide, so called from its brownish red appearance when in fine powder and cold, is produced by calcination of the higher oxides. When warm its powder is nearly black. It is this oxide in very small quantity that gives the characteristic tinge to the amethyst, and colors various minerals and artificial glassy compounds an amethyst or violet color. Manganic acid is produced when compounds of manganese are fused with potash carbonate of soda, and combining with the alkali a green-colored compound is obtained. This is a common blowpipe test of the presence of manganese. The compound of chief interest among those named is the bioxide, or as it is commonly known the peroxide or black oxide of manganese. It occurs in nature in the form of the earthy mineral wad, which consists of equivalents of peroxide combined with one of water; and also in the one called pyrolusite (see, *rep. fire*, and *see*, to solve, in reference to action in destroying the green and brown stains in glass). The latter is largely employed in the arts in the preparation of oxygen, the gas of the purest quality giving up of the gas equal to its weight when brought to a white heat. By means of this chlorine is evolved from its natural compounds, and oxide of manganese is thus an important element in the manufacture of artificial compounds of this element. (See BLEACHING POWDER, and CHLORINE.) Its power of decoloring glass tinged by green protuberances of iron, Liebig suggests, is not due to its converting this into the faint yellow sesquioxide, as has been supposed, but to its producing

an independent amethystine tint, which neutralizes the optical effect of the green stain of the iron. Peroxide of manganese is also employed to give a dark-colored glaze to pottery; and by Berzelius it was recommended for preserving water sweet on long voyages, a few pounds being introduced into each cask. The black oxide of manganese, when slowly introduced into the system, as happens to those grinding the ore, is said to act as a cumulative poison, its effects first appearing in a staggering gait and symptoms of palsy. As a medicine the oxide is sometimes administered in cases of diseases of the skin, of scurvy, &c. By means of its salts of the protoxide are prepared, which are employed like those of iron for their tonic and anti-anæmic properties, and unlike these can be used in conjunction with tannic acid and other astringent medicines.—Though manganese is present at least as a trace in almost all minerals and rocks, its oxide is not often found so free from impurities, and especially from oxide of iron, as the ore is required to be for commercial purposes. Mines of it have been wrought to considerable extent along the range of the hematite ores in Vermont and Massachusetts, as at Chittenden, Bennington, West Stockbridge, and Sheffield; and in the southern states it is known to occur at many localities along the range of the metamorphic rocks. It is found like the hematites in loose masses of clays and sands which are associated with the limestones of this group. The pyrolusite, more or less mixed with iron ores, runs up into the crevices of the limestone, and is distributed in very uncertain quantities. The finest ores are foreign, and are imported to considerable extent into the United States from France, Germany, England, and Nova Scotia. Some of the most extensive mines in Europe are in Thuringia and Moravia. In England the consumption of oxide of manganese is about 25,000 tons annually, and of this 17,000 to 18,000 tons are employed in the manufacture of bleaching powder.

MANGEL WURZEL. See BEET.

MANGLES, JAMES, a British naval officer and traveller, born about 1785. He entered the navy as a volunteer in March, 1800, and in 1801 he was appointed midshipman on board the *Narcissus*, and soon after took part in the expedition to the Cape of Good Hope. After the capture of the French frigate *Volontaire* in 1806 he was made acting lieutenant. In 1814 he was appointed to the *Duncan* as first lieutenant, and in the following year promoted to the rank of commander. In 1816, in company with Capt. C. L. Irby, he visited the continent and various parts of the Levant, went up the Nile with Beechey and Belzoni, and joined Belzoni in clearing away the sand from the entrance to the great temple of Abousambul. They then crossed the desert to Syria and the Dead sea, whence in 1820 they returned to England. Soon afterward they printed for private circulation a selection from the letters written by them while absent to their friends at home, and in 1844

Mr. Murray, having received from the authors a gift of the copyright, republished the work in the "Home and Colonial Library," under the title of "Travels in Egypt and Nubia, Syria, and the Holy Land." It is written in a simple, unostentatious style, but is very interesting and trustworthy. Capt. Mangles retired from the navy on half pay in 1882.

MANGO, the name of a delicious East India fruit, produced by a tall tree with a spreading top, which, when not in flower, resembles the sweet chestnut; it is the *mangifera Indica*, and belongs to the natural order *terebinthaceae*. The foliage of the mango consists of oblong lanceolate, petiolate leaves; the flowers are polygamous and borne on erect terminal panicles; they have white petals streaked with yellow and spreading at the apex; only a single stamen of the many in each blossom is fertile. The fruit is a somewhat kidney-shaped, smooth drupe or plum, which when fully ripe is yellow and reddish, or speckled with black, replete with a fine agreeable juice; some are full of fibres, and the juice runs out of these on cutting or with a little handling; but those which have few or no fibres are much the finest; they cut like an apple, but are more juicy, and are said to be sometimes as large as a man's fist, but the most common are about the size and appearance of a small golden-pippin apple. The mango is esteemed to be very wholesome, and, with the exception of the mangosteen and some of the best pineapples, it is considered the finest tropical fruit. In India, preserves, tarts, and similar confections are made from the unripe fruits; pickles are also made from the green fruit and sent to Europe. There are numerous varieties of the mango, chiefly differing in the size, color, flavor, and figure of the fruit, like apples and pears. The best mangoes have an agreeable acidity, and a rich, sweet, perfumed flavor. Belonging to a natural family which secretes a gummy resin, it is not singular that the wild fruits of the mango contain often a strong terebinthine flavor, which renders them not very palatable; hence much discrepancy exists as to the value of the fruit. But when due care is taken to procure the best sorts, by raising them from layers of well known and esteemed varieties, there is no dispute about their merits. In Cuba, where it has been introduced within perhaps a century or little more, there are already numerous varieties, well known by distinct names. One of these is called the heart mango, and is among the largest and best, being more delicate and having less of the turpentine flavor. The mango tree is described as being one of the most beautiful of the fruit trees upon the island, its leaves long, lanceolate, polished, hanging in dense masses of dark green foliage. The mango is well adapted to hothouse culture, on account of its bearing fruit when small. Sweet informs us that in England the fruit ripens under such culture. Its favorite soil seems to be a sandy loam or a mixture of loam and peat made up into beds

well drained. Fresh seeds from the West Indies vegetate freely, but cuttings from well known kinds are preferable; such can be rooted in sand under hand glasses. The mango is cultivated in bark beds of hothouses in various parts of the United States.

MANGOSTEEN (Malay, *mangostana*; *Garcinia mangostana*, Linn.), a tree growing with an upright stem to the height of 20 feet, and bearing a very beautiful and eatable berry, esteemed the most delicious of East Indian fruits. The mangosteen belongs to the natural order of *guttifera*, which contains trees that are natives of the hottest parts of the world, and well known by their thick, entire, opposite leaves and resinous juices. In countries where they grow, they are of great importance; and of this character may be considered the mangosteen. Its leaves are entire about 7 or 8 inches long, and about half as much in breadth at the middle, gradually tapering at both ends, of a shining green above, but of an olive color beneath. The flower resembles a single rose, composed of 4 roundish petals which are thick at the base, but thinner toward the margins; they are of a dark red color. The fruit is round, about the size of a middling orange, and is crowned by a broad peltate-lobed stigma; the rind is like that of the pomegranate but softer, thicker, and fuller of juice; it is green at first, but changes to a dark brown with some yellowish spots; the inside is of a rose color, and is divided into several cells by thin partitions in which the seeds are lodged, surrounded by soft, juicy pulp of a delicious flavor partaking the strawberry and the grape. It can be eaten in great quantities without any inconvenience and it is the only fruit which sick people in India are allowed to eat without scruple. It is said that Solander, when in the last stage of a putrid fever at Batavia, found himself insensibly recovering by sucking this delicious and refreshing fruit. The pulp has a most happy mixture of the tart and the sweet, and is no less salutary than pleasant. The dried bark of the *Garcinia* is used with success in dysentery and tenesmus and an infusion of it is considered a good gargle for a sore mouth or for ulcers in the throat. The several species of the genus are recommended for their beauty as fitted for stove plants and are readily raised from cuttings under hand glasses. They all require a high temperature in order to thrive.

MANGOUSTE. See ICHNEXUMON.

MANGROVE, the popular name of a variety of tropical plants constituting the natural order *rhizophoraceae*. They grow on the shores of rivers, and extend down to the verge of the ocean, rooting in the mud and forming thickets and even forests, reaching sometimes below high water mark, so that the branches are loaded with oysters and other shellfish. Such a dense mass of vegetation effectually excludes the sun's rays, and prevents the evolution of the putrefying and miasmatic gases, rendering the vicinity unhealthy and dangerous. The mangroves are exogenous shrubs or trees

Having simple, opposite, occasionally dotted, entire or else serrate leaves, with convolute deciduous stipules between the petioles. Their flowers are polypetalous, each petal arising from the calyx and alternating with its lobes, and of the same number; the stamens are of an indefinite number, 2 or 3 times as many as the petals, having distinct filaments, and erect, imbricate anthers. The ovary is plurilocular, its cell containing 2 or more ovules. The fruit is indehiscent, crowned with the calyx, one-celled and one-seeded. In natural characters, it will be seen, the mangroves are structurally allied to the myrtles; there is a marked peculiarity, however, in the germination of the seed. There are several distinct genera embraced in the natural order of the *rhizophoraceæ*, but the number of mangroves proper seems to be few. Of these may be instanced the common or black mangrove (*rhizophora mangle*, Linn.), found in the Caribbean islands, and stated likewise to be native to Malabar. These trees vary in height, being in some places 20, in others above 80 feet high in proportion to the richness or depth of the muddy soil in which they grow. The bark is smooth, of a light brown, in the smaller branches inclining to red; the leaves are somewhat like those of the bay, with their middle veins yellow, having footstalks an inch long; the smaller branches are jointed at the distance of every inch. The flowers usually grow 2 or 3 together, and sometimes on single footstalks 1 to 3 inches long, having each 4 yellow petals, which before they open are covered with a greenish calyx divided into 4 parts; the flower is succeeded by green succulent substances in form not unlike a pear, at the small end of which hangs a single seed about 6 inches in length. These seeds when they fall are carried floating on the water and lodged on muddy banks, where their larger ends settle in the mud and take root, the smaller ends sprouting into branches and leaves. The trunk of the mangrove seldom grows to any considerable thickness, but the wood is tough and hard, bears the water well, and is much used for knees and ribs in long boats and other small craft, for which the archings and angles of its limbs most naturally adapt it. Its lower branches become frequently the supporters of the oyster, which has given rise to a fabulous account of the strength of this shell fish. The fruit of this mangrove is said to be sweet and edible, and its juice fermented makes a light wine. Branches, leaves, and trunks of these trees are brought from the West Indies as ballast or for dunnage and sold as such, for which use they are excellent. There are two varieties known there, that called the red mangrove, the best and hardest wood; of the other, called the white, the wood is light, poor, and is used as fuel. The mangrove of the East Indies, also occurring in the West Indies, is the *Avicennia* of Linnaeus. Its branches bend downwards but do not take root in the ground. Its bark is heavy, of a deep red, and takes a very fine polish.

MANGUM, WILLIE PERSON, an American statesman, born in Orange co., N. C., in 1792. He was graduated at the university of North Carolina in 1815, subsequently studied law, and in 1818 was elected a member of the house of commons from Orange co. In the succeeding year he was elected a judge of the superior court, and between 1823 and 1826 represented his district in congress. In the latter year he was again elevated to the bench, and in 1831 he was elected a senator in congress, where he served a full term. In 1837 he received the 11 electoral votes of South Carolina for president of the United States. For 12 years subsequent to 1841 he was a senator in congress, and during the administration of President Tyler was president of the senate. Since 1858 he has lived in retirement. During the greater part of his congressional career he was a leading member of the whig party.

MANICHÆANS, or MANI, a religious sect, founded in Persia in the 2d half of the 3d century A. D. by Manes or Mani. The life of the founder and the origin of the sect are still involved in great obscurity, as there are two varying accounts of them, the one found in Greek, the other in oriental writers. The Greek account refers back to the record of a disputation between Manes and Archelana, bishop of Cascar in Mesopotamia, which is said to have been first written in Syriac, and soon translated into Greek, but the greater part of which now exists only in a very corrupt Latin translation. According to this authority, Manes was not the real author of the system which is called after him, but he fraudulently appropriated the writings of two predecessors, Scythianus and Terebinthus, and proclaimed their doctrines as his own. The first came forward as the teacher of a new religion in the capital of Persia, whence he sent one of his disciples, Thomas, to Egypt, another, Addas, to Scythia, while only Hermas remained with him. He promised to the king to cure his sick son; but the latter died, and Manes was imprisoned. There he was found by his disciples on their return, who told him of the opposition their doctrines had met with among the Christians. Manes then procured a copy of the Christian Scriptures, adopted some portions, changed others, and referred to himself the promise of the Paraclete. When his disciples were sent out by him a second time, the king intended to have him put to death, but he escaped. He was invited by the bishop of Cascar to a public disputation, and, according to the bishop's report, was completely refuted. Fleeing from the rage of the people, he fell into the hands of the king of Persia, who now had him put to death, his skin stuffed, and his flesh given to the birds. This Greek account is not regarded by historians as very authentic, but the opinion of Beausobre and Neander that the whole of it should be rejected is not generally adopted.—The oriental accounts of Manes are not so old, but clearer and more trustworthy. In some points

they differ among themselves, especially with regard to the relation of Manes to Christianity. Abulfaragius states that Manes was a Christian presbyter, who apostatized, called himself the Messiah, and sent out his disciples to preach his dualistic system throughout the countries of the East as far as Hindostan and China. The Mohammedan writers, on the other hand, say nothing of his having been a Christian. But, in general, Manes appears in the oriental works as a celebrated Persian magian, astronomer, and painter, who aimed to introduce a perfect universal religion. At first he was a favorite of King Sapor, but subsequently had to flee to India, where he became acquainted with Buddhism, some of whose doctrines he received into his system. He was protected by King Hormas, and returned to Persia in 272; but the next king, Bahram, ordered him to be put to death about 277, when he was accused by the magi of corrupting the old religion. The report that he was flayed alive is not mentioned in the best authors, and seems to be a later invention.—After the death of Manes his adherents in Persia were subjected to a long persecution, and many of them are said to have fled to Hindostan. Sapor II. condemned all the members of the sect to death on account of their doctrine of celibacy, but they continued to be numerous, and found converts even at the court and in the royal family, thereby occasioning a new persecution in 525. Some congregations of Manichæans are mentioned in the 8th century. They split into several parties, of which little more is known than the names. In Syria, Egypt, Palestine, and other countries, the Manichæans early made their appearance, and the northern coast of Africa became one of their principal seats. An edict of Diocletian, about 290, the genuineness of which is still doubtful, ordered the proconsul of Africa to burn the leaders of the sect, together with their writings. Under Constantine the Manichæans were included in the general toleration, but the succeeding Christian emperors issued severe decrees against them, especially after 373. Nevertheless they continued to prosper for a long time. Their congregations were numerous, and had many able leaders, as Ælimantus, Faustus of Miletus, Felix, and others. Augustine was for 9 years a member of this sect, but left them when he found among them neither the thoroughness of learning nor the purity of character which he had expected. He became their most zealous opponent, yet did not succeed in converting many. The Arian Vandals persecuted the Manichæans most cruelly. In Italy, and especially in Rome, they were very numerous, and maintained intimate relations with the congregations in other countries. Pope Leo I., in union with the secular government, took severe measures against them, by which the various ramifications of the sect were discovered. Valentinian III. punished them with exile, and Justinian ordered all Manichæans to be put to death. By these persecutions the sect gradually became extinct, al-

though traces of it are found, in later centuries, in Gaul and Spain, and its influence extended throughout the middle ages, reappearing under different modifications, in the Priscillianists, Paulicians, Bogomiles, Catharists, and other sects, who were therefore called New Manichæans.—Of the writings of Manes only a few fragments are left (Fabricius-Harless, *Bibliotheca Græca*, vol. viii. p. 815 *et seq.*), especially from his *Epistola Fundamenti* and the *Theaurus*. But these fragments, as well as what is left of the writings of other Manichæans, have been preserved in the writings of their opponents. The latter are numerous, and Augustine in particular published a number of volumes against them. The detached portions of the Manichæan system, contained in the ancient writers, were collated with great skill by Dr. C. F. Baur of Tübingen, *Das Manichäische Religionsystem nach den Quellen untersucht* (Tübingen, 1831), which is generally acknowledged as the standard work on the subject.—Manichæism, like the kindred Gnostic systems, is an attempt to blend portions of Christianity with the dualism of Persia and the pantheism of Indian Buddhism into a higher form of universal religion. Dualism, however, is the basis. Manes assumes two original substances, in which all opposites centre, and from which they proceed. "There were," as he says in his book of mysteries, "God and Hyle, light and darkness, good and evil, absolutely opposed to each other so as to exclude any communication." Thus matter, which in the Zoroastrian doctrine is by no means regarded as bad in itself and as anti-divine, is identified with the bad and with darkness, and opposed to good, which is the essence of light. The latter is represented as the pure, intelligible light, and the visible light is said to be its work and image. God is the father of light, and is described as being all splendor, truth, holiness, goodness, and happiness, dwelling amid innumerable beings of light, and surrounded by 12 signs or worlds of light, which as a heavenly zodiac preside over the great year of the world. They are not, however, emanations from God, but God is one with the kingdom of light, the whole forming one substance. Opposed to the kingdom of light is the kingdom of darkness, which is divided into 5 regions, and in which the demon or prince of darkness sustains the same relation to his superiors as the God of light occupies in his kingdom. By an inroad which the kingdom of darkness made into the kingdom of light, the primitive man, who was the first born son of God, was overthrown and imprisoned. He was subsequently delivered, but a portion of light remained imprisoned in the darkness. God then brought into existence through the agency of the mother of life, the present universe, that it might be a new receptacle of this lost light. Two new heavenly powers, Christ and the Holy Ghost, proceeded from God, to redeem the retained light from imprisonment. While they attract the forces of light from the material world, the prince

darkness and the spirits imprisoned in the stars seek to keep them back. He therefore formed the man Adam after the image of the primitive man, combining in him as in a microcosm the clearest light with his own darkness. From him descended the human race, each individual of which presents a mixture of the two elements, light and darkness. As generation is a principle belonging to the kingdom of darkness, every new generation weakens the power of the light and fortifies the ascendancy of matter. In Judaism and paganism mankind fell entirely under the dominion of matter. To break this dominion Christ appeared, in order to reveal again the lost truth. He showed himself on several occasions in his true form of light, especially on the mountain of transfiguration; but the pure light of his essential being could not unite itself with matter. Therefore his life upon earth, his sufferings and death, were merely a semblance. He was neither born of a woman, nor baptized, nor did he die nor rise again. The statements of the New Testament are only partially true; the full truth about Jesus was first revealed by the Paraclete (Manes). The genuineness of the Gospels and of the Acts was denied by the Manicheans; the Epistles were regarded as interpolated, and many apocryphal Christian writings, especially the Acts of Thomas, were made use of by them. Christ by his doctrine and his attractive power commenced the process of liberating the light from its bondage, as the carnal minds of his contemporaries scarcely misunderstood him, and it required the coming of Manes to reveal the secret relations of the universe, and to secure the means of human freedom. Manes, as the Paraclete promised by Christ, led men to a knowledge of the complete truth. The redemption of man consisted in a knowledge of the revelations made by Christ and Manes respecting the character of the two empires, the soul and its relation to the body, and a corresponding mode of life. Their system of ethics was severely ascetic, based on the conviction of the intrinsic evil of matter. Their great aim was to set the soul and the imprisoned light free from the fetters of matter. The abstinence which they therefore practiced was of a threefold character: 1. The *signaculum oris* forbade all impure thoughts, all blasphemous words, but above all the use of any kind of food which might increase the power of the body over the spirit, and especially of flesh, which, as the product of Hyle and a consequence of the death of the animal, being destitute of light, can only depress the soul. Wine and strong drink in general were forbidden. 2. The *signaculum manuum* prohibited every kind of work through which man enters this world, which is the kingdom of darkness, and makes it a pleasant home. The killing of animals, gathering of fruit, &c., were regarded as an offence against the light of life which pervades through all nature. 3. The *signaculum* prohibited all sexual delight as coming from matter, continuing the first sin, and preparing

by procreation new prisons for the soul. Legal, external marriage was not absolutely forbidden, but celibacy was strongly recommended, while the prevention of procreation was a moral duty. This rigorous asceticism was, however, not prescribed for all, but only for the higher class of members, who were called *electi* or *perfecti*, and whose relation to the lower class or *auditores* corresponded to that of the faithful and the catechumens in the Catholic church, or that of the pneumatics and psychics among the Gnostics. The auditors were permitted to eat meat, to marry, to occupy themselves with material and industrial pursuits, and to fill public offices, but were also bound to supply the elect with all the necessaries of life. For the destruction of plants and several other sins which the auditors could not avoid, they received, through the intercession of the elect, absolution and indulgence. (See Wegnern, *Manichæorum Indulgentiarum cum brevi totius Manichæismi Adumbratione*, Leipzig, 1817.) With the death of the elect, a new process of purification begins. A large wheel with 12 buckets, which is fastened on the heavens, receives their souls and conveys them to the moon. The full moon represents a ship laden with light; after 15 days it is emptied of its cargo, which is conveyed over to the larger light ship, the sun. The latter conveys the purified souls into the kingdom of light. The auditors reach their aim only by long and circuitous paths. The fate of unbelievers is everlasting damnation.—Only the elect constituted the church. Among them there were a number of offices, probably formed after the hierarchy of the Catholic church. Manes himself had sent out 12 apostles, and this college was afterward represented by 12 *magistri*, with a 13th invisible one, without doubt Manes himself, at their head. After them followed 70 or 72 bishops, who in turn had under them presbyters, deacons, and the other *electi*. Their worship consisted mostly in hymns and prayers, and while offering these they used to turn toward the east. They had no temples. Sunday was celebrated as the day of the sun, but, contrary to the custom of the Catholic church, with fasting. Baptism with water was not used. The ceremonies at the reception of new members and their mode of celebrating the eucharist are not well known. They commemorated the death of Christ, but with still greater solemnity that of Manes. The latter festival was called the festival of the pulpit (*bema*). A pulpit was erected in the hall and hung with costly draperies; 5 steps led to it, perhaps symbolizing the 5 orders of the hierarchy; and the believers prostrated themselves before it.—See, beside the works already mentioned, Beausobre, *Histoire de Manichée et du Manichéisme* (2 vols. 4to., Amsterdam, 1739-'44).

MANIGAULT, GABRIEL, an American merchant and revolutionary patriot, born in South Carolina in 1704, died in 1781. He was the son of Huguenot parents who emigrated from France to avoid religious persecution; and

about the age of 25 he embarked in business in Charleston, of which he became one of the wealthiest and most esteemed citizens. Sympathizing with the patriotic cause in the revolutionary war, he advanced to his native state out of his private fortune the sum of \$220,000; and when the city of Charleston was menaced by the British under Gen. Prevost, he armed himself in its defence, although he was then 75 years of age, and caused his grandson, a boy of 15, to be likewise armed and equipped. He was distinguished for his integrity and benevolence, and was a zealous supporter of the French Calvinist church in Charleston.

MANILA, the capital of all the Asiatic possessions of Spain, comprising the Philippine, Ladrones, and Caroline archipelagoes, situated in the island of Luzon, at the mouth of the river Pasig, which discharges into the bay of Manila, in lat. $14^{\circ} 86'$ N. and long. $120^{\circ} 52'$ E.; pop. about 160,000, of whom about 8,000 are Europeans and 7,000 Chinese. The great bulk of the inhabitants belong to the Pagalas and other races of the Philippine archipelago. A portion of the city, situated on the S. or left bank of the Pasig, is enclosed by walls and moats; and this fortified part contains the cathedral, palace of the governor-general, court of justice, military barracks, arsenal, town hall, and other public buildings. It has about 18,000 inhabitants, a large proportion of whom are Europeans. On the N. bank of the Pasig are the suburbs, which contain all the warehouses, shops, manufactories, and abodes of the native population. The walled city and suburbs are connected by a handsome stone bridge of 10 arches. The environs of the fortified portion are beautified by a tastefully laid out *paseo*, or promenade, shaded by avenues of luxuriant tropical trees. There is also a spacious cemetery, filled with rich monuments, and with evergreen shrubbery. The churches, convents, and monasteries are very numerous. The chief industry of the native population is connected with the preparation of tobacco, hemp, and pina fibre, a beautiful fabric made from the pineapple leaf, for home markets and exportation. The cigar manufacture employs 7,000 women and over 1,000 men; and the fine species of grass matting prepared here is much used in the manufacture of hats and baskets. A larger remuneration is given for native labor than in any other city of the eastern hemisphere. An ordinary laborer receives \$8 to \$10 per month, which is double what he receives in Calcutta and Batavia; and yet subsistence can be procured as cheap in Manila as in any part of India or the Malay archipelago. This city is by law the sole emporium of foreign trade with the Spanish East Indies. Its site is happily chosen, within a spacious bay, with good anchorage, and situate upon a short navigable river, with rapid current, communicating with the Lado de Bay, the largest body of fresh water in the Asiatic archipelago, which furnishes the city with an abundant supply of excellent fish. The

value of land in the vicinity of the city is very high. According to statements in the *Estado de las Filipinas*, the price of a *quinon* of land (a measure of 1,000 square fathoms) is from \$800 to \$1,000, or about \$600 per acre. The climate is healthy, but the city is subject to severe rain storms and hurricanes; the latter are most violent at the change of the monsoons, and have often torn vessels from their anchorage, and carried them far inland. The wet monsoon continues about 5 months; and during this period as much as 115 inches of rain has fallen at Manila, and the lowest quantity was 84 inches. The temperature is very equable; the thermometer seldom rises above 97° F. or falls below 75° .—In 1569 the site of Manila was occupied by a small Malay town, defended by stockades, which was captured and destroyed by 80 Spaniards under the command of Juan de Salcedo, nephew of Miguel Lopez de Legaspé, the conqueror of the Philippines and founder of the city of Manila. Legaspé was indefatigable in promoting the growth of this city. Within two years after its conquest he had built the great cathedral, the metropolitan church of all Catholic Oceania. He established a municipal organization, which was confirmed by Philip II. of Spain, and continues to be its form of city government. Chinese laborers and traders settled in large numbers in the city, and in time became very turbulent. In 1603 an insurrection took place, and 28,000 Chinese were massacred. Notwithstanding this, in 86 years after this event the Chinese numbered in Manila about 80,000. The severity of imposts and religious persecution again led to insurrection, which terminated with the slaughter of about 25,000 Chinese, and the banishment of the remainder; but they soon again resorted to the city in large numbers, and assisted Sir William Draper in the capture of it in 1762. The English expedition, composed of 2,800 Europeans and sepoya, which sailed from Madras, took the city by storm, after a siege of 10 days. The governor and archbishop agreed to pay \$4,000,000 on condition that the sack should last only 8 hours; one fourth of the amount was paid on the spot, and the balance of the demand was met by a draft on the royal treasury of Madrid, which however was dishonored. The English commander has been rendered conspicuous by his controversy with Junius concerning this ransom. The Japanese had much trade with this city, and were settled in it in large numbers during a portion of the 17th century, before their laws excluded them from all communication with the rest of the world. They imported the raw material extensively used in their manufactures directly from the Philippine, as also from the Malay archipelago. The recent opening of Japan to the trade with foreign nations will probably revive the former commercial relations between that country and Manila. Manila maintains active commercial relations with France, Germany, Switzerland, China, California, the Sandwich

islands, and Chili, but chiefly with Great Britain and the United States. The imports consist of cotton, woollen, and silk manufactures, watches, clocks, jewelry, and drugs. The principal exports are tobacco, indigo, hides, sapan wood, sugar, and hemp, and cigars and cheroots. The export of cigars to the United States from Manila in 1857 was nearly 5,000,000, and of the whole Philippine islands in 1859, 11,000,000.

MANILIUS, MARCUS, the author of an astronomical Latin poem entitled *Astronomica*, whose history is altogether conjectural. Bentley supposed that he was an Asiatic, and Huet that he was a Carthaginian, and there are indications in his poem that it was written under Augustus, or at furthest not later than the reign of Tiberius. It is in 5 books, in a rough and unfinished state, showing perhaps that it was never published in the author's lifetime. It treats successively of the origin of the universe, the rise and progress of astronomy, the position and magnitude of the earth, the signs of the zodiac, the constellations, planets, comets, and meteors. It then discourses of the universal and almighty and pervading every part of the universe, vindicates the dignity of astronomy, and finally enters into the details and technicalities of the science. Whewell says that it has no value in the history of science. The first manuscript of the *Astronomica* was discovered by Poggio in 1416, and was printed at Nuremberg in 1472 or 1473. Other and better MSS. were afterward found, from which were prepared the editions of Alder (Leyden, 1600) and Bentley (London, 1704). There is an English metrical translation of the poem by Creech (London, 1697).

MANIN, DANIELE, an Italian statesman, born in Venice in 1804, died in Paris, Sept. 22, 1857. The son of an eminent lawyer, he prepared himself for the same profession at the university of Padua, where he was graduated in 1821. He married in 1825, and led a quiet domestic life at Mestre, near Venice, engaged in historical and legal studies and writings; and commencing practice at the bar about 1830, he gained a high reputation as a jurist and orator. He early became known as a champion of the liberal party, though not involved in any of the secret societies, and aiming to combat Austria rather with legal weapons than by conspiracies. On several important political trials, however, he acted as counsel for the defence, which brought him into collision with the government. After the accession of Pius IX. to the papal see, Manin and Tommaseo became the leaders of the reform movement in Venice (1847). Manin exerted himself to make Austria give a legal effect to the laws which she had nominally granted to Venice. He asked for a separate government of Venice and Lombardy, a revision of the codes, an annual budget, and freedom of religion and of the press. But his hopes of securing pacific concessions from the house of Hapsburg were destroyed by Radetzky's successes in Milan (Jan. 9, 1848), his and his colleagues' protests (Jan. 18) against the gener-

al's proceedings resulting only in the imprisonment of the two patriots. The French revolution of Feb. 24, 1848, found him still in prison; and as he was detained illegally he refused to be set free by the populace (March 17), and would only leave his place of detention on a decision of the courts. The revolution advanced in the mean time with rapid strides; the Austrian commander, Count Zichy, was obliged to surrender, March 22; the republic of Venice or St. Mark was proclaimed, March 23, and Manin and Tommaseo were placed at the head of affairs. The Venetians prepared to form an independent republic in confederation with the other Italian states; but as the policy of Charles Albert seemed for a while auspicious for the liberation of the whole country, the Venetian assembly, which was convened June 8, agreed to the fusion with Piedmont and Lombardy so as to form a united kingdom of northern Italy. Manin tendered his resignation on the occasion, but resumed power after the defeat of the Sardinians at Custoza (July 25), when Lombardy was restored to Austria, and when the Venetians fell back upon their own resources and prepared for a separate defence. The republican banner of St. Mark was again hoisted, Aug. 11, and a triumvirate was appointed to carry on a dictatorial government, Aug. 13, Manin being its head, while the military command was intrusted to the Neapolitan general Pepe. After some time the dictatorship was succeeded by a responsible administration, but Manin continued to hold supreme power as its president, maintaining order in Venice, and organized the resistance against the Austrians, who blockaded the city. After the destruction of the hopes of Italy by the defeat of Charles Albert's army at Novara, March 23, 1849, the Austrians concentrated their efforts upon the subjugation of Rome and Venice, the national movement being soon after that battle crushed in almost every other part of Italy. Gen. Haynau, who operated against Venice at Mestre, in vain summoned Manin to surrender; he also scorned to entertain the overtures for negotiation made by Radetzky in the beginning of May, 1849, notwithstanding the critical condition of the city. After a severe bombardment, Fort Malaghera, one of the forts outside of Venice, fell into the hands of the Austrians, May 26; but Manin, encouraged by the victories of the Hungarians over their common enemies, still held out, although the inhabitants were exposed to the incessant fire of the Austrians and to the pangs of famine and distress, while the cholera raged in the city. Rome was obliged to surrender to the French on July 3. Venice, however, continued its resistance, and it was not until the city was completely surrounded by the enemy, its provisions entirely exhausted, and the news of Görgey's surrender had arrived, that Manin consented to negotiate; and even then (Aug. 23) he agreed only to a capitulation, after having secured favorable terms which granted an amnesty to all that had taken part

in the conflict, excepting 40 of the most conspicuous defenders of the city, including of course himself, who were compelled to withdraw before the entrance of Radetzky (Aug. 30). Manin thus had the honor of continuing the contest long after it had ceased in other parts of Italy, while his administrative genius and unselfish wisdom received universal admiration. He spent the rest of his life in exile in Paris, supporting himself by giving lessons in Italian. His motto, "Independence and national unity," he held to till the last. He occasionally expressed his views in the *Presse*, *Siècle*, and *Estafette* newspapers of Paris, in the "Times" and "Daily News" of London, and in the *Diritto* of Turin. His health had long been failing, and his death was hastened by that of his wife, and by that of his accomplished daughter in 1855, at the age of 17. He was buried at Montmartre. The French government did not interfere with the publicity of the funeral, which was attended by a vast concourse of people, including many of the most eminent native and foreign population of Paris. A *Histoire de la république de Venise sous Manin*, by Anatole de la Forge, has since been published in Paris.—The son of Manin took an active part in the Sicilian expedition of Garibaldi in May, 1860, and at the head of a body of soldiers he coöperated with the 7th column of Garibaldi, formed of volunteers from Pavia, and the 8th, composed of patriots of Bergamo, in compelling the Neapolitan general Landi, with a column of 8,500 men, to abandon his strong position at Calatafimi (May 15). This engagement, which determined the victory of Garibaldi, was described by one of the officers as a fight of lions. The young Manin and a son of Garibaldi were among the wounded, and among the principal heroes of the day.

MANITOU, among some tribes of the American Indians, the name of any object of worship. "The Illinois," wrote the Jesuit Marest, "adore a sort of genius, which they call manitou; to them it is the master of life, the spirit that rules all things. A bird, a buffalo, a bear, a feather, a skin—that is their manitou." "If the Indian word manitou," says Palfrey, "appeared to denote something above or beside the common aspects and agencies of nature, it might be natural, but it would be rash and misleading, to confound its import with the Christian, Mohammedan, Jewish, Egyptian, or Greek conception of Deity, or with any compound of a selection from some or all of those ideas." The word was applied to any object used as a fetich or an amulet.

MANITOU LIN, a group of islands in the N. part of Lake Huron, belonging chiefly to British America, the principal of which are Great Manitoulin, or Sacred island, the largest, about 90 m. long by from 5 to 30 broad; Little

Manitoulin or Cockburn, 7 m. in diameter; and Drummond's, 24 m. long by from 2 to 12 wide, and separated by a channel hardly 1 m. wide from Michigan, to which it belongs; pop. of the whole about 2,000, principally Indians. Great Manitoulin has thick and extensive pine forests, and contains a great deal of fine scenery.

MANITOWOC, an E. co. of Wis., bordering on Lake Michigan, and drained by the Manitowoc, E. and W. Twin, and Sheboygan rivers; area, 612 sq. m.; pop. in 1855, 18,048. The soil is fertile, and the county is heavily timbered, pine lumber being the principal article of export. Aggregate value of real and personal estate in 1855, \$1,839,250. Capital, Manitowoc.

MANLEY (DE LA RIVIERE), Mrs., an English authoress, born in Guernsey about 1670, died in London, July 11, 1724. She was the daughter of Sir Roger Manley, governor of the island of Guernsey, who, dying when she was young, committed her to the care of a relative. The latter, who had already another wife, enticed her into a marriage with himself and deserted her in London. The duchess of Cleveland, one of Charles II.'s mistresses, then took her under her protection, but with characteristic fickleness soon deserted her. In this emergency she retired from the world, and as a means of support began to write for the stage. Her "Royal Mischief," a tragedy represented at Lincoln's Inn Fields theatre in 1696, brought her into great literary repute, and she almost immediately became the centre of a brilliant circle of wits and men of fashion, in whose profligate course of life she was induced to embark. Although engaged in numerous intrigues, she did not neglect her literary pursuits, and soon produced her "Memoirs of the New Atalantis," a romance in 4 vols., describing with much freedom of language and under feigned names the amours of several distinguished characters. The work created so much scandal that a criminal prosecution was commenced against the printer and publisher, to screen whom from punishment she voluntarily declared herself in the court of king's bench the sole author. She was in consequence imprisoned for a time, but was subsequently released on bail. Upon the accession of the tories to power in 1711, she resumed her position as a wit and leader of fashionable profligacy, and employed her pen also with effect in behalf of the ministry, under the direction, it is said, and with the approval of Swift. The "Vindication of the Duke of Marlborough" and other political pamphlets testify to her industry in this department of literature; and she also conducted the "Examiner" for some time after it had been relinquished by Swift, and frequently finished pieces begun by him. Among her remaining works are: "Lucius, the First Christian King of Britain," a tragedy, for which Steele wrote the prologue and Prior the epilogue; the comedy of the "Lost Lover, or the Jealous Husband;" and a variety of novels, memoirs, dramas, and poems, now quite forgotten. During the last few years of her life

she lived with her printer, John Barber, an alderman of London.

MANLEY, JOHN, an American naval commander, born in 1784, died in Boston in 1798. At the outbreak of the revolutionary war he had command of the armed schooner *Lee*, with which he cruised along the coast of Massachusetts bay, making captures of great value to the American army then investing Boston. Among these was an ordnance brig laden with heavy guns, mortars, and intrenching tools. In Aug. 1796, he was commissioned as a captain by congress; and in July, 1778, his ship, the *Hancock*, was captured by a British frigate of superior strength. After a rigorous confinement in Halifax, he was exchanged, and in 1782 was put in command of the *Hague* frigate, which, after lying in a perilous position on a sand bank off Guadeloupe for 8 days, exposed to the fire of 4 British ships of the line, contrived to effect her escape. This exploit closed the regular maritime operations of the United States during the revolutionary war. Capt. Manley was subsequently tried by a court martial on a variety of charges, from which he was not entirely absolved.

MANLI, one of the most celebrated patrician *gentes* of ancient Rome, members of which held high offices in the state for about 5 centuries. The first who attained to the consulship was Cneius Manlius Cincinnatus, consul in 480 B. C., who fell in battle against the Etruscans. —MARCUS MANLIUS CAPITOLINUS, consul in 392 B. C., put to death in 381, obtained his surname, according to Livy, from his defence of the capitol against the Gauls in 390. Roused from sleep by the cackling of the sacred geese, he hastily collected a force, and repulsed the enemy, who had already gained the summit of the hill. He incurred the enmity of the patricians by his defence of plebeian debtors, was accused of aiming at the kingly power, and was for a time imprisoned. After his liberation, he instigated the plebeians to take up arms, but was arraigned for high treason before the people in the Campus Martius, was condemned to death, and was thrown from the Tarpeian rock. The Manlian *gens* determined that the name of Marcus should be conferred in future upon none of its members.—The Torquati and Vulsones were families of the Manlian *gens*.

MANLY, BASIL, D.D., an American clergyman, born near Pittsborough, Chatham co., N. C., Jan. 28, 1798. He was graduated at the South Carolina college in 1821, and commenced preaching in Edgefield district, S. C., whence he removed in 1826 to Charleston, to take charge of the Baptist church. He became president of the university of Alabama in 1837, and having filled that post for nearly 20 years, resigned it owing to enfeebled health. He soon took charge of another church in Charleston, which he subsequently gave up to engage in missionary travels throughout Alabama, in which he is now (1860) engaged. He bore an important part in the movements which led to the organization of the

southern Baptist convention in 1845, and in the establishment of the southern Baptist theological seminary at Greenville, S. C., in 1858.

MANN, A. T., a Flemish antiquary and physicist, born about 1740, died in the early part of the present century. He early embraced a monastic life, but about the age of 35 procured his secularization, and thenceforth devoted himself exclusively to antiquarian researches and scientific pursuits. He is the author of a work on the means of protecting buildings against fires, of an elaborate description of Brussels, an introduction to geography, a series of chronological tables from 1700 to 1802, &c., and of a number of useful memoirs and dissertations on the physical aspects of the Netherlands, the congelation of sea water, &c.

MANN, HORACE, LL.D., an American statesman and educationist, born in Franklin, Norfolk co., Mass., May 4, 1796, died at Yellow Springs, Greene co., Ohio, Aug. 2, 1859. His father, Thomas Mann, was a farmer in limited circumstances, and the education of the son was obtained entirely from the common district schools until the age of 20, when he began to prepare for college, and in 6 months fitted himself to enter the sophomore class of Brown university, Providence, R. I., to which he was admitted in Sept. 1816. He was graduated in 1819 with the highest honor, and the theme of his oration foreshadowed his future career; it was on "The Progressive Character of the Human Race." He now entered an office in Wrentham as a student of law, but at the end of a few months he was invited back to college as a tutor in Latin and Greek. In the latter part of 1821, having resigned his tutorship, he entered the law school of Litchfield, Conn., where he studied for a year. He then entered the office of Mr. Richardson of Dedham, where he completed his studies, was admitted to the bar in Dec. 1823, and immediately opened an office in Dedham. In 1824 he was selected as fourth of July orator in Dedham, and in 1826 delivered a eulogy on Presidents Adams and Jefferson, who died July 4 of that year. In 1827 he was elected a representative to the legislature from Dedham, by the national republican or whig party. His first speech in the house was in favor of religious liberty, and his second in behalf of railroads, which is believed to be the earliest speech on that subject made in any legislative body in the United States. From this time Mr. Mann became a leading member of the house, and took an active part in the discussion of all important questions, especially such as related to morals, public charities, education, or the welfare of the poor, the ignorant, or unfortunate classes. He was foremost in procuring the enactment of laws for the suppression of intemperance and the traffic in lottery tickets, and for improving the system of common schools. He was a member of the committee which reported the resolves that subsequently resulted in the codification of the statute laws of Massachusetts. The establishment of the state lunatic

hospital at Worcester was conceived, sustained, and carried through the house by him alone, against the direct opposition of some prominent members. He moved the appointment of the original committee of inquiry, and made its report, drew up and reported the resolve for erecting the hospital, and made the only speech that was delivered in its favor. After the law was passed, he was made chairman of the board of commissioners to superintend the erection of the hospital; and when the buildings were completed in 1833, he was appointed chairman of the board of trustees for administering the institution. Mr. Mann continued to be returned by large majorities as a representative from Dedham until 1838, when he removed to Boston and entered into partnership with the Hon. Edward G. Loring, now a judge of the U. S. court of claims. At the first election after he became a citizen of Boston he was chosen a member of the state senate, and by reelections was continued a senator for 4 years. In 1836 and again in 1837 he was elected president of the senate. During this period he was a member and for a part of the time chairman of the legislative committee for the revision of the state statutes; and a large number of most salutary provisions were incorporated into the code at his suggestion. After the revised statutes were enacted, he was appointed in conjunction with Judge Metcalf to edit the work, for which he prepared the marginal notes and the references to judicial decisions.—At the organization of the Massachusetts board of education, June 29, 1837, he was elected its secretary, and for the next 11 years was annually reelected by the unanimous vote of the board. On accepting this office he withdrew from all other professional and business engagements, transferred his law business then pending, declined reelection to the senate, abstracted himself entirely from political parties, and while he held it never attended a political caucus or convention of any kind, resolving to be known only as an educationist. He commenced at once a vigorous and thorough reform in the school system of the state. Extensive changes in the law relating to schools were proposed and adopted; normal schools were established; school committees were paid; a system of county educational conventions was instituted; by means of "school registers" the actual condition of the schools was ascertained, and the same object was promoted by the detailed reports which the school committees were now required to make. Of these reports abstracts were made by the secretary with immense labor, but also with immense benefit to the cause of education, and embodied in his annual reports a series of remarkable documents, the first of which, written within 6 months after his appointment, excited great attention among the friends of education. In 1848, under the auspices of the board, but at his own private expense, Mr. Mann visited Europe, to examine schools and to obtain such information as could be made available at home.

His 7th annual report, made on his return, embodied the results of this tour. Probably no other educational document ever had so wide a circulation. Many editions were printed, not only in Massachusetts, but in other states, sometimes by order of legislatures, sometimes by private individuals. Several editions were printed in England. In the autumn of 1844 a pamphlet of 144 pages appeared in Boston, bearing the names of 81 of the Boston schoolmasters, and entitled "Remarks on the Seventh Annual Report of the Hon. Horace Mann," contesting several of his facts and impugning some of his views, especially on the subject of school discipline, in which he advocated the disuse of corporal punishment. He immediately replied in a pamphlet of 176 pages. In May, 1845, a portion of the Boston teachers rejoined in another pamphlet of 215 pages, and in July following Mr. Mann replied in one of 124 pages. This closed the controversy, the result of which was a triumphant victory on the part of Mr. Mann. Public opinion, which had followed the contest with unusual interest, compelled the teachers to adopt in practice his views on discipline and corporal punishment. During his secretaryship Mr. Mann wrote 12 long annual reports, of one of which, the 10th, the "Edinburgh Review" said: "This volume is indeed a noble monument of a civilized people; and if America were sunk beneath the waves, would remain the fairest picture on record of an ideal commonwealth." From an immense mass of documents he prepared 11 abstracts of the Massachusetts school reports and returns, 6 of which are large 8vo. volumes in fine print. The "Common School Journal," which he edited and much of which he wrote, consists of 10 vols. 8vo. He published a volume of lectures on education, at the request of the board. He travelled over the state every year to hold conventions or teachers' institutes, at which he often taught all day and then lectured in the evening. His correspondence was more voluminous than all his other writings, and sometimes amounted to 80 letters a day. He was continually called upon for legal opinions in regard to school matters, which he always gave gratuitously; and whenever the cases in which they were given were brought before the courts, his opinions were invariably sustained. He superintended the erection of two state normal school houses, and drew plans and gave directions for hundreds of others. He says in his "Supplementary Report" in 1848: "From the time when I accepted the secretaryship in June, 1837, until May, 1848, when I tendered my resignation of it, I labored, in this cause, an average of not less than 15 hours a day; from the beginning to the end of this period, I never took a single day for relaxation, and months and months together passed without my withdrawing a single evening from working hours to call upon a friend. My whole time was devoted, if not wisely, yet continuously and cheerfully, to the great trust confided to my hands." Only

in a single instance was any public appointment made by him during this whole period unfulfilled, and in that case his physician forbade his rising from a sick bed to meet it.—John Quincy Adams, who represented in congress the district in which Mr. Mann resided, died Feb. 23, 1848, and Mr. Mann was nominated as his successor by the whig party, and chosen by a large majority. On June 30 he made his first speech in congress in maintenance of the right of that body to legislate for the territories of the United States, and its duty to exclude slavery therefrom. In the ensuing November he was re-elected, receiving 11,000 out of 18,000 votes. During his first session he volunteered as counsel for Drayton and Sayres, indicted for stealing 76 slaves in the district of Columbia, and at the trial was engaged for 21 successive days in their defence. In 1850 he engaged in an animated controversy with Daniel Webster in regard to the extension of slavery and the fugitive slave law, and Mr. Webster's famous speech of March 7 of that year. At the ensuing election in November Mr. Webster's friends succeeded in the whig convention in defeating by a single vote Mr. Mann's renomination. He, however, appealed to the people as an independent anti-slavery candidate, and after an exciting canvass, in which, contrary to the usage then prevailing in Massachusetts, he addressed meetings in his own behalf, he was re-elected. His last speech in congress was on the slavery question, and was made Aug. 17, 1852. Editions of it were printed in various parts of the country, and more than 100,000 copies were sold.—On Sept. 15, 1852, the state convention of the free soil party of Massachusetts, assembled at Lowell, nominated Mr. Mann for governor, and on the same day he was chosen president of Antioch college, a new institution just established at Yellow Springs, Greene co., Ohio. He was not elected governor, but his popularity in Massachusetts was shown by the fact that his vote was 30 per cent. greater than that given for the other free soil candidates. He accepted the presidency of Antioch college, and continued there till his death, laboring with his usual zeal and energy in the cause of education and philanthropy. He carried the institution triumphantly through its early pecuniary and other difficulties, which were of no ordinary magnitude, and satisfied himself by the experiment that a college for the common education of both sexes was entirely practicable.—Beside his annual reports, his volume of lectures on education, and his voluminous controversial writings, the principal work published by Mr. Mann was entitled "Slavery: Letters and Speeches" (Boston, 1851).

MANNA, the concrete juice of several species of ash of the genera *ornus* and *fraxinus*, as the *O. Europaea*, *O. rotundifolia*, *F. excelsior*, and *F. parviflora*. The juice exudes in the summer months, either spontaneously or through incisions made for the purpose in the bark, and is collected in leaves placed as cups to re-

ceive it; or it forms incrustations upon twigs, straws, and leaves placed under the trees. It is an article of import for the sake of its medicinal qualities, and is obtained chiefly from Sicily and Calabria. The best is of a whitish or light yellow color in flakes and tears, while the poorer sorts are darker colored from the impurities with which they are mixed. It possesses a sweet, somewhat nauseous taste, and is soluble in water or in alcohol. From its boiling saturated solution it separates on cooling in crystalline form. It consists of a crystallizable sweet principle called mannite, which sometimes amounts to 75 per cent.; of true sugar; and of a yellow nauseous matter, which it is supposed gives to the manna its purgative property. For the sake of this it is used in medicine, and is commonly prescribed with other purgatives, as senna, rhubarb, magnesia, &c., the taste of which it conceals, while it increases their effect.—A substance called manna is obtained by the Bedouin Arabs in the form of an exudation from the *tamarix gallica mannifera*. After collecting it from among the twigs and leaves, they boil it, then strain it through cloth, and put it away in leathern bags to be eaten like honey with bread, as a delicate article of food. Dr. Robinson, in his "Biblical Researches in Palestine," mentions its being collected in small quantities by the Arabs of Mt. Sinai, and sold at very high prices to the Russians.—Though the name is probably derived from the Syriac *mano*, a gift, which was applied to the scriptural manna, it cannot be proved that there is any relationship between the natural products designated by this name and the substance mentioned in Scripture as miraculously supplied to the Israelites, and of which we possess no information by which we can identify it.

MANNHEIM, or MANHEIM, a German town, in the grand duchy of Baden, capital of the province of the Lower Rhine, situated on the right bank of the Rhine, at the confluence of the Neckar with that river, 11 m. by railway N. W. from Heidelberg, 64 m. N. from Baden-Baden, 94 m. N. N. E. from Strasbourg, and 54 m. S. from Frankfort-on-the-Main; pop. in 1856, 25,500. It is connected by steamers with Cologne and other parts of the Rhine, and by railway with the principal towns of Europe. Goethe has appropriately called it "the pleasant, clean Mannheim." The regularity of the buildings, however, gives to the town a somewhat monotonous appearance. It consists of 11 straight streets, crossed by 10 other streets at right angles, forming 110 regular squares. It is divided into two parts by the great street leading from the palace to the suspension bridge over the Neckar. The principal public squares are the Paradeplatz (where Schiller resided in the house called *zum Karleberg*) and Marktplatz, adorned with monuments and fountains. Behind the palace, which contains collections of art and a cabinet of natural history, are beautiful gardens, ending in a raised terrace upon the brink

of the Rhine (*Rheindamm*). Along the banks of the Neckar, in the outskirts of the town, are handsome private gardens, and a broad avenue (*Plankenstrasse*) between the Heidelberg and Rhine gates is planted with trees. The town was formerly the capital of the Palatinate. It suffered severely in the 80 years' war, and was almost destroyed by the French in 1688 after a siege of 17 days. The town was soon rebuilt, and was fortified in 1699 after the system of Coehorn. Its present prosperity is mainly due to the elector Charles Theodore, who made it the capital, but after 1777 the government was transferred to Carlsruhe. During the wars of the revolution, the French attacked the town in Dec. 1794, and took formal possession of it in 1795. In 1799 it was occupied for a short time by the Austrians, after whose departure the French reentered it. In virtue of the arrangements which were made subsequent to the treaty of Lunéville, Mannheim was allotted to Baden in 1803.

MANNING, HENRY EDWARD, an English clergyman and author, born about 1812. He was educated at Baliol college, Oxford, was chosen fellow of Merton, and obtained the living of Lavington in Sussex. He was next made archdeacon of Chichester, and published several volumes of sermons. The Gorham decision, leaving the doctrine of the effect of baptism an open question in the church of England, called forth a declaration from him, and other well known clergymen and laymen of the establishment, that, unless that decision was formally repudiated, it would be of binding force upon the English church. They strove to free that which they conceived to be the church of Christ from submission to a doctrinal decision given by the crown. Their attempt, however, was without result, and, with the exception of one or two protests, the action of the court was acquiesced in. Dr. Manning, first giving up his archdeaconry and vicarage, and then spending some time in seclusion, was received into the Roman Catholic church in 1851. Shortly after he embraced the ecclesiastical state, and after living some time in Rome, he returned to England, where he has been engaged in clerical labors. He has been made provost of the chapter of Westminster, and has founded a congregation of secular priests called the Oblates of St. Charles, modelled upon the rules of St. Charles Borromeo. They have two missions in London, one at St. Mary of the Angels, Bayswater, and the other at Westminster. Beside several volumes of sermons, Dr. Manning has published a treatise "On the Unity of the Church," "Lectures on the Grounds of Faith," &c.

MANNING, JAMES, D.D., an American clergyman, and first president of Brown university, born in Elizabethtown, N. J., Oct. 22, 1788, died in Providence, R. I., July 29, 1791. He was graduated at Princeton college in 1762, and in the following year became pastor of a Baptist church at Morristown, N. J. About a year later he accepted an invitation to become

pastor of a church in Warren, R. I., and almost immediately commenced a Latin school, which seems to have been in some sense the germ of Rhode Island college. He had previously, at the request of an association formed for the purpose in Philadelphia, proposed to several influential gentlemen of the denomination, assembled at Newport, the organization of "a seminary of polite literature, subject to the government of the Baptists," and had drawn up a plan for such an institution. In 1764 the legislature granted them a charter, and in 1765 Mr. Manning, then but 27 years of age, was appointed "president and professor of languages and other branches of learning, with full power to act in these capacities, at Warren or elsewhere." The college went into operation at Warren in 1766, and the first commencement was held there in 1769, when a class of 7 was graduated. In 1770 it was determined to remove the college to Providence, and Mr. Manning removed with it. During the revolution, when the college edifice was occupied as a military barrack, and afterward as a hospital, he was actively engaged in clerical duties, and also rendered important services to the patriotic cause. In 1788 he resumed his duties at the college, and in 1786 he was chosen to represent Rhode Island in congress. He exerted himself in favor of the adoption of the present national constitution. From 1770 till the year of his death he was also pastor of the first Baptist church in Providence. He resigned the presidency of the college in 1790.

MANOMETER (Gr. *manos*, thin or rare, and *metron*, measure), an instrument for measuring the rarity of elastic fluids, more especially that of the air. While the barometer gives the pressure of the superincumbent column of air, the manometer indicates also the amount of expansion caused by increase of heat. Robert Boyle made a very simple form of manometer, which he called the statical barometer, by suspending a light glass globe exhausted of air at one end of the beam of a delicate balance, and exactly counterpoising it with a weight when the barometer stood at 30 inches. The buoyancy of this globe changed with the varying density of the medium in which it was suspended; as the atmosphere became rarer the globe descended, and as the density of the air increased it rose. Other manometers have been contrived to correct the mercurial barometer by showing what proportion of the movement of its column is due to change of temperature, and what to variation in the pressure of the atmosphere induced by other causes. Ramsden constructed one of a glass tube of small bore, like a thermometer tube, and having a bulb blown at one end, the other remaining open. Into this, the pressure of the atmosphere being known, he introduced a small portion of mercury, which was supported by the air in the lower part of the tube and bulb, and cut off the communication of this with the external air, while the barometric pressure continued the same. The effect induced

by changes of temperature were then marked upon a scale attached to the tube in degrees corresponding to those of Fahrenheit's thermometer. The instrument is now an air thermometer, but correct only under the same atmospheric pressure. If this diminishes, the enclosed air expands and stands at a higher degree than the mercury in the common thermometer; so if the atmosphere becomes heavier, the manometer falls by the air it contains being compressed, even though the ordinary thermometer in the same time may have risen by increase of temperature. From both these instruments the height of the barometer may be determined.—For indicating pressures greater than that of the atmosphere, a column of mercury in a glass tube is variously employed. Under the ordinances of the French government of 1843 and 1846 the boilers of stationary engines employing an effective pressure not exceeding that of 4 atmospheres, and those of steamboats using a similar pressure not exceeding that of 2 atmospheres, were required to be provided with a manometer consisting of a long upright tube open at the top and connected below with the boiler, a stopcock shutting off this connection as desired. For higher pressures another form of manometer was allowed, in which the tube filled with air is closed at the top and dips below into a bath of mercury upon which the pressure of the steam is applied. The scale is divided according to Mariotte's law of æriform fluids being compressed in proportion to the power applied. This is a common form of steam gauge, but like that of the open tube it is defective in consequence of the glass soon becoming dim by oxidation of the mercury at the surface. It is also liable to become inaccurate by portions of air occasionally escaping when the pressure is off, and by the steam insinuating itself between the mercury and the glass and condensing in the upper part. To obviate these and other defects, a great variety of manometers have been devised for the special use of steam gauges.

MANRESA, a town of Spain, in the province of Barcelona, 80 m. N. N. W. from the city of Barcelona; pop. 13,839. It is one of the most picturesque towns of Catalonia and the centre of a rich farming district, beside which it has extensive manufactures of broadcloth, cotton, silk, tape, ribbons, gunpowder, and brandy. The streets are crooked, and lined with quaint old-fashioned houses; but there are some elegant churches and other public buildings, and in the neighborhood is the famous monastery of Montserrat, and the "cave of St. Ignatius," where Loyola passed some time in retirement before founding the society of Jesus. Manresa was taken by the French under Macdonald in 1811, when more than 800 buildings were burned, including hospitals and churches. This wanton act so incensed the Catalans, that they fell upon the rear of the French army on its march to Barcelona, and destroyed 1,000 men.

MAN8, LE, a town of France, capital of the

department of Sarthe, 132 m. S. W. from Paris, on the W. bank of the river Sarthe, here crossed by 3 bridges; pop. in 1856, 31,162. It consists of an old town and a new town, and has a considerable trade. It is a place of great antiquity, having been founded in the 2d century A. D. by the Romans, and called Suindinum or Cenomani, after the Gallic people of the same name, in whose territory it was situated. During the war of the league Le Mans was captured by Henry IV., and in 1793 it was the scene of the destruction of the Vendean army, when upward of 10,000 persons were slaughtered.

MANSEL, HENRY LONGUEVILLE, an English metaphysical and theological writer, born about 1815. He was educated at Oxford, became a fellow of St. John's college, in which he is still a tutor, and has also filled the office of Waynflete professor of moral and metaphysical philosophy. His first publication was a small volume entitled "Demons of the Wind, and other Poems" (1838). In 1851 he produced his *Prolegomena Logica*, a philosophical introduction to logic, and prepared an edition of Aldrich's *Artis Logice Rudimenta* (3d ed., 1856). In 1856 he delivered at Oxford a "Lecture on the Philosophy of Kant," which was printed, and designed by its brevity to attract readers who would be deterred by a more elaborate exposition. His most important work is the Bampton lectures delivered before the university of Oxford in 1858, and published under the title of "The Limits of Religious Thought." His object was to determine whether there exists "in the human mind any direct faculty of religious knowledge, by which, in its speculative exercise, we are enabled to decide, independently of all external revelation, what is the true nature of God, and the manner in which he must manifest himself to the world; and by which, in its critical exercise, we are entitled authoritatively to decide for or against the claims of any professed revelation, as containing a true or false representation of the divine nature and attributes." His negative answer to this inquiry is founded upon Sir William Hamilton's principle that thought can deal only with what is conditioned and plural, not what is absolute and single, and that the infinite, as such, cannot be known. The work immediately passed through several editions, and is the most important application that has been made of the philosophy of the conditioned to questions of religion. Mr. Mansel was one of the editors of the academical lectures of Sir William Hamilton (1859), and is the author of the article on "Metaphysics" in the 8th edition of the "Encyclopædia Britannica," which was reproduced separately in 1860. He has also published "The Limits of Demonstrative Science Considered," and an inaugural lecture entitled "Psychology the Test of Moral and Metaphysical Philosophy."

MANSFELD, an ancient family of German nobility, taking its name from the castle of Mansfeld now belonging to Prussian Saxony.

Among its distinguished members were: I. **PETER ERNST**, count of Mansfeld, born in 1517, died in Luxemburg in 1604. The greater part of his life was spent in the service of the emperor Charles V., and of his son Philip II. of Spain, who employed him in various important military and administrative capacities. Having been appointed governor of Luxemburg, he maintained that province in tranquillity at a time when the other provinces of the Netherlands were a prey to civil and religious commotions. In 1592 he succeeded the duke of Parma as governor-general of the Netherlands. II. **ERNST**, natural son of the preceding, born in 1585, died near Zara, Dalmatia, Nov. 20, 1626. He was educated by his godfather, the archduke Ernest of Austria, and for his military services to the emperor Rudolph II. and Philip III. of Spain was legitimatized by the former. But having been denied the dignity and estates of his father, which had been promised to him, he embraced Calvinism, and subsequently became one of the most formidable enemies of the house of Austria, by which he was called the Attila of Christendom. At the commencement of the 30 years' war, he joined the elector palatine Frederic, elected by the Protestants king of Bohemia, and vigorously opposed the imperial forces in Bohemia, and also on the Rhine, where he ravaged the territories of the Catholic princes, and became a terror to his enemies. Though repeatedly beaten, he came forth so formidable from every defeat, that, when fighting for a desperate cause and lying under the ban of the empire, he found himself courted at the same time by the kings of Spain, France, and England, and the republics of Holland and Venice. In 1625 he succeeded in raising subsidies in England, and landed in Holland with considerable reinforcements, with the design of invading the hereditary possessions of the house of Austria. Defeated by Wallenstein at Dessau in April, 1626, he nevertheless pursued his march to Hungary, to effect a junction with Bethlen, the Protestant prince of Transylvania. But being unable to join his ally, he formed the design of reaching England by the way of Venice, and died on the march at a village in Dalmatia, leaning in full military array upon the arms of his officers. With the exception of Gustavus Adolphus, he was the ablest general on the Protestant side in the 30 years' war.

MANSFIELD. I. A township and post village of Tolland co., Conn., on the Natchaug river, and the New London, Willimantic, and Palmer railroad, 24 m. E. from Hartford; pop. in 1850, 2,517. It is chiefly noted for the production of silk, in which it surpasses any other place in the United States. It was introduced by Dr. Aspinwall, and in 1793 there were raised 265 lbs.; in 1827, 2,431; in 1830, 10,000; and in 1850, 25,000 lbs. In 1850 there were 5 silk factories, 2 cotton factories, 1 woollen factory, 4 grist mills, 5 saw mills, and 3 tanneries. II. The capital of Richland co., Ohio, on the Pittsburg, Fort Wayne, and Chicago, the At-

lantic and great western, and the Sandusky, Mansfield, and Newark railroads, 45 m. from Sandusky, and 193 from Cincinnati; pop. in 1850, 8,557; in 1860, about 6,000. It contains 70 stores, 6 manufactories, a branch of the state bank of Ohio, 2 weekly newspaper offices, 11 churches, and a large union school with an average attendance of 900 pupils.

MANSFIELD, WILLIAM MURRAY, earl of, a British jurist and statesman, born in Scone, Perthshire, March 2, 1705, died March 20, 1793. He was the 8d son of Viscount Stormont, a Scottish peer of Jacobite tendencies, several of whose family became deeply involved in the rebellion of 1745. Removed to London at an early age, he was educated at Westminster school, and thence passed to Christchurch college, Oxford, where he had a reputation for classical learning, and distinguished himself by a Latin oration in praise of Demosthenes. In 1731 he was called to the bar, and at the same time, being of a vivacious temperament, with the advantages of aristocratic connections and signal personal graces, he became a companion of wits and men of letters, and in particular gained the friendship of Pope. Almost at the outset of his career a new class of business, that of appeals from the court of session in Scotland to the house of lords, fell into his hands, and so large became his emoluments that he is said to have remarked that he never knew the difference between absolute want of employment and a professional income of £8,000 a year. Being now, in the words of his friend Pope, "so known, so honored in the house of lords," he was enabled, by the accidental illness of his senior counsel in the crim. con. action brought by Theophilus Cibber against Mr. Sloper, to show his abilities in a common law cause; and so skilful was his management of the defence that the jury gave but £10 damages to the plaintiff. His advance was thenceforth rapid, and in 1743 he was appointed solicitor-general, having the year previous entered parliament for Boroughbridge, for which place he was afterward returned in 1747 and again in 1754. As a legislator he displayed an eloquence "of which the clear, placid, and mellow splendor was never for an instant overclouded," and a depth and variety of knowledge which brought him into great prominence, at the same time that his peculiar political views exposed him to the attacks of Pitt, who frequently taunted his rival with his Jacobite connections and presumed sympathies. In 1747 he was one of the managers for the impeachment of Lord Lovat, and performed his part in so generous a spirit as to elicit praise from the prisoner himself, who called him "an honor to his country," and wished that "his being born in the north might not hinder him from the preferment which his learning and merit deserved." In 1754 Mr. Murray was appointed attorney-general, and in 1756 succeeded Sir Dudley Ryder as chief justice of the king's bench. So important were his parliamentary services to his party, that extraordinary efforts were

made by the duke of Newcastle to retain him in the house of commons, as a government leader. He was offered various sinecure offices with large salaries, and finally a pension of £6,000 a year, but steadily refused them all, regarding the situation of chief justice as preferable to the responsibilities and labors which the chancellorship, the premiership, or any other merely political office involved, and distrusting probably his own ability to perform the functions of a party leader. Finally, upon threatening, in case the chief justiceship was withheld from him, to leave the ministry to fight their own battles in the house of commons, he was appointed to the office, and at the same time created Baron Mansfield of Mansfield in the county of Nottingham. Contrary to general usage, though not to precedent, he became at the same time a member of the cabinet; and in 1757, while temporarily holding the office of chancellor of the exchequer, at the request of the king he effected the coalition between Newcastle, Pitt, and Fox, which resulted in the celebrated first administration of Chatham, the crowning glory of English political history. He participated on important occasions in the proceedings of the house of lords, where Lord Camden and subsequently Chatham became his chief antagonists, and where at one time his opinions were probably held in greater deference than those of any other man living; but on questions affecting popular privileges or influence he showed a decided leaning toward an arbitrary government. The stamp act, which he aided in preparing, in particular found in him an earnest and able advocate, and the doctrine of taxation without representation was by no means more persistently defended. In reference to the agitation in the North American colonies which preceded the repeal of the act, he held that the Americans must first be compelled to submit to the power of parliament, and must exhibit "the most entire obedience" before an inquiry could be had into their grievances. The utterance of opinions like these marked him out as an object of popular dislike and party violence, and for many years he was attacked with a vindictiveness characteristic of the English press of that time, and which found its fullest expression in the letters of Junius, by whom "all the resources of the English language were exhausted in desolating and unpunished party libels on the chief justice of England." He nevertheless performed his judicial duties with dignity and courage; and on the occasion of the application of Wilkes in 1768 for the reversal of his outlawry, when public excitement had reached an almost unprecedented height, and the chief justice had been repeatedly threatened in anonymous letters, he announced to the partisans of Wilkes, who crowded Westminster hall, his contempt for the means that had been taken to deter the court from its duty. His unpopularity was still further increased by his direction to the jury in the trial of Woodfall, the publisher of Junius, that the printing and sense of the paper were

alone what they had to consider of." This attempt to restrict the right claimed by juries, in criminal prosecutions for libel, of determining whether a paper was a libel or not, brought upon Lord Mansfield the charge of arrogating to himself the functions of a legislator rather than of an administrator of the law; and Junius in his letter of Nov. 14, 1770, said to him: "No learned man, even among your own tribe, thinks you qualified to preside in a court of common law; yet it is confessed that, under Justinian, you might have made an incomparable prætor." The subject also gave rise to a discussion between Lord Camden and himself, in which the former is held to have had clearly the advantage. In the Gordon or "no popery" riots of 1780 the popular odium was so strongly excited against him, that his house in Bloomsbury square, with its valuable library of books and manuscripts, his private papers, furniture, and other valuables, were utterly destroyed by the mob, from whose fury he only escaped by taking refuge in Buckingham palace. He bore these misfortunes with a calmness which seemed to disarm his enemies of their vindictiveness, declining any pecuniary compensation from the treasury; and during the remainder of his life parties generally united in a feeling of respect for his character and virtues. He retained his office of chief justice until 1788, having in the interim several times declined the chancellorship, and passed the last few years of his life in retirement. He left no children, and his title of earl of Mansfield, granted in 1792, descended to his nephew, Viscount Stormont, to whom the greater part of his large property was bequeathed. The title of Baron Mansfield expired with him.—As a jurist the character of Lord Mansfield contrasts favorably with the timidity and narrow-mindedness which marked his legislative career; and when not influenced by political views his decisions were almost uniformly correct. Commencing his judicial career as a reformer, he aimed at expediting legal proceedings, and by diminishing the expenses of suitors, and preventing unnecessary delays, caused the business of the courts, though greatly increased, to be despatched with unexampled rapidity. Sir James Burrow, in the preface to his reports, mentions that of the 800 causes set down in a year for the London and Middlesex sittings, all were disposed of. Gifted with an acute and powerful intellect, and with a wonderfully retentive memory, he was in the habit of considering the intent and spirit of the law rather than its letter; but his eagerness to discourage technicalities, and preference of the principles of the civil law, occasionally led him to make the law instead of expounding it. In constructing a system of jurisprudence and adapting a progressive state of society to circumstances and cases entirely new, he was eminently successful; and English commercial law, particularly that branch of it relating to marine insurance, will be an enduring monument of his genius and industry. His conduct on the bench was

marked by great dignity and amenity of manners, and in general he showed himself so worthy of his high office that Lord Chatham, for many years his determined political opponent, comparing him with two of the most illustrious British jurists, Somers and Holt, exclaimed: "I vow to God, I think the noble lord excels them both in abilities." It deserves to be mentioned to his credit also, that, though opposed to liberal ideas, he was uniformly tolerant in matters of religious opinion. His personal appearance was striking—"his countenance beautiful, inspiring reverence and regard; his eye gleaming with light; his voice acutely clear, yet varied and musical; his manner graceful and engaging." His arguments and decisions are preserved in Atkins's, Burrows's, Douglas's, and Cowper's reports; and his life has been written by Henry Roscoe and Lord Campbell.

MANSLAUGHTER. In the article **HOMICIDE**, it is said that felonious homicide is either manslaughter or murder. These two are distinguished from each other by the intent which causes or accompanies the act. If a homicide be not justifiable nor excusable, and yet be not committed with malice aforethought, it is manslaughter. It is quite certain that the intent need not be to kill; for while there must be a criminal intent to make a person amenable to law as a criminal, yet if one crime be intended, and in the act of committing it another of a higher character be also committed without intent, the criminal is responsible for this higher crime. The general principle laid down in respect to manslaughter is, that not only a positive intention to commit some crime, but mere negligence, may make one guilty. If any one take upon himself an office or duty requiring care or skill, he is liable for the want of either; and if death be the consequence of his ignorance or carelessness, he is guilty of manslaughter. So if one driving furiously run over and kill a person whom he did not see, or if one in command of a steamer or sailing vessel by reason of gross negligence run down a boat and some one in it be drowned, this would be manslaughter. So if any one, whether medical by profession or not, deal with another as a physician, and through gross want of care or skill kill him; or if any one charged with building a house of any kind construct it so badly that it falls and kills persons within or near it; or if in building he drop a stone upon some one passing below, and kill him; in all these cases he would be guilty of manslaughter, provided he were grossly negligent in the act causing the death. This is the essential question; thus, in the last case, if he were building in a place where few persons were, and it was by a rare occurrence that some one happened to be where the stone fell, it is said that there would be no such negligence as would make the killer responsible as a criminal; while, on the other hand, if it were a crowded thoroughfare, and the person dropping the stone gave no notice

or warning and used no precaution to prevent mischief, the crime would then amount to murder. So if one ride a vicious horse, who kicks some one to death, it is no crime whatever if the rider did not know his character and did nothing by his carelessness to bring about the fatal result; but if he knew that the animal was vicious, and carelessly rode him near a crowd and exposed him to alarm likely to make him run into the crowd and do mischief, then the killing would be manslaughter. Sometimes it is said that if manslaughter be charged upon one on the ground of negligence only, without intent, this charge can be sustained only by evidence of the grossest negligence. It has been held that the mere omission to do an act cannot, although death ensue, make the man guilty of manslaughter. But if the omission were of an act which was certainly a duty, and such an act that any reasonable person must know that its omission would be very dangerous to life, the principles of criminal law would lead to the conclusion that this might be manslaughter. Thus, in a recent case of much interest, a man employed to wall a shaft in a colliery, and whose duty it was to place a stage over the mouth of the shaft, having omitted this, and a man being thereby killed, the court of king's bench held him guilty of manslaughter. It seems to be agreed that if the act omitted were a legal duty, it would certainly amount to that crime. It should be added that the law always presumes (in the absence of clear proof to the contrary) that a man intended to do the thing he actually did, and intended the consequences which naturally and actually flow from his act; and this principle applies even where the act causes death. So a very nice distinction is taken in law, between a *malum prohibitum* and a *malum per se*. Thus, if there be a law prohibiting the shooting of woodcocks before the 4th of July, one who shoots at one in June intends to break a law; but if, while thus shooting, by mere accident and without negligence, he should kill a man, this would be no crime, because shooting a woodcock at that season is an offence only because the law has made it so. But if he shoot at his neighbor's poultry, and by accident kill his neighbor, this is manslaughter; because the destroying his neighbor's property was an offence of itself, independently of municipal law. If one is insane he cannot make himself criminally liable; but if he voluntarily make himself insane, or if he be drunk from alcoholic liquors, or opium, or any similar drug, the law does not permit this to be an excuse, partly because it looks upon such intoxication or voluntary insanity as itself a wrong, and partly because it would be very dangerous to permit a criminal to shelter himself under any such excuse.—But by far the most frequent and most difficult questions in practice, are those which must be determined either by the means used to produce death, or by the presence or absence of previous hostile intention. It is a general rule, that if one kills another

with a deadly weapon, it is more than manslaughter; and it has been said authoritatively, that whether the weapon used be a deadly weapon or not, is not a question of fact for the jury, but a question of law for the court. (See **MURDER**.) The other question, as to previous hostility, generally turns upon the preliminary question, whether the act was committed in "the heat of passion," or under sudden provocation. If one, being angry, attacks another, his anger is not an entire excuse. But if a quarrel and conflict ensue, and the assailant kills the man whom he attacked, while this is a felonious homicide, it is not murder, because there is an absence of that malice aforethought which is of the essence of murder; and therefore it is manslaughter. Still further would it be from murder if the party killing had been himself attacked. But neither would this excuse the act if it were not made necessary by the nature of the attack; but it would reduce the crime to manslaughter. Here, however, it is to be remembered that such a quarrel makes that to be only manslaughter which would otherwise be murder, for no other reason than because it negatives the supposition of malice aforethought. If therefore this be proved—as if it be shown that the killer had a grudge against the deceased, and had manifested a violent hatred and intention to injure him—it might be inferred that he provoked the quarrel merely to give him the opportunity of gratifying his malice. In such a case the quarrel, instead of negating malice, would help to prove it; and therefore, of course, it could not have the effect of reducing the felony to manslaughter. So if there had been a quarrel and much provocation, and the quarrel had abated, and one of the parties withdrew and provided himself with a dangerous weapon, and returning killed the other, the excuse of "heat of passion" would not apply, for there would then be evidence of deliberate purpose. So, too, let the provocation be what it may, if there be no excitement or heat of passion, the killing will be deemed deliberate and intentional. Still, where there was much provocation, and no evidence of hostile purpose previous to the provocation, the killing itself would generally be deemed evidence of excited temper. There are other cases which the law regards as only manslaughter, without evidence of momentary excitement; partly because the law infers that from such a provocation there must be excitement; and partly, perhaps, because the party killed brought his death upon himself by his outrageous wrong. Thus, if a husband detects his wife in adultery, and instantly and purposely takes either her life or the adulterer's, it is only manslaughter. Not so, however, if he waits for a subsequent opportunity, for then the first reason wholly fails, and the killing becomes murder. In one English case, where a man had his pocket picked, and with the assistance of others threw the thief into a pond to punish him by a ducking, and the man was drowned,

this was held only manslaughter. It is said, however, by an American judge, that some regard must be had to the nature and origin of the provocation, as well as its extent; for if one were outraged and maddened by a libel, and thereupon should instantly kill the libellant, this would be murder; we still think, however, that if the excitement were such as to negative the presumption of malice aforethought, it would be only manslaughter. Questions of this kind are so frequent, and at the same time so difficult, that the legislatures of many of the United States have endeavored to aid in their determination, by discriminating between different classes and degrees of manslaughter, defining each degree, and affixing to it appropriate punishment. We have not space to speak of these in detail, but to illustrate the prevailing principles of classification refer to the statutes of New York. By these, four degrees of manslaughter are defined. The first degree, briefly stated, consists of killing without the purpose of death, when the deceased was engaged in perpetrating or attempting a crime less than felony, and where such killing would be, at common law, murder. Assisting in self-murder is manslaughter in the first degree, as also wilfully killing an unborn quick child by injury to the mother, if it would be murder in case the mother died from the injury. The second degree consists in procuring abortion otherwise; killing in the heat of passion without the intent of death, but in a cruel and unusual manner; or killing unnecessarily one attempting to commit felony. The third degree is killing in heat of passion, without intent of death, but with a dangerous weapon; involuntary killing, by procurement or negligence of another, while the person killed is engaged in committing a trespass on property; suffering an animal known to be mischievous to go abroad without care, or keeping it without care, and thereby causing death; receiving wilfully or negligently so many persons into a boat or vessel as to cause death; racing while in command of a steamboat carrying passengers, bursting the boiler, and so killing; killing by a physician while in a state of intoxication. The fourth degree may be said to include all other modes or forms of manslaughter, known as such at common law, and of a milder kind than the preceding.

MANTCHOORIA, or **MANTCHURIA**, the land of the Mantchoos, a country of Asia, mostly belonging to the Chinese empire, but partly to the Russians, bounded N. by the Yablonoi-Khrebet or Outer Hing-an mountains, which separate it from the Russian province of Yakootsk, E. by the channel of Tartary and sea of Japan, S. by Corea and the gulf of Pe-chee-lee, S.W. by the great wall, W. by Mongolia and the Inner Hing-an or Sial-Koi mountains, and N. W. by the Kerloo river and Daoorian mountains; between lat. 42° and 58° N., long. 120° and 142° E.; area, 700,000 sq. m.; pop. estimated at 7,000,000. A large part of this country is an uninhabited

wilderness, and but little of it has been visited by Europeans. Nearly the whole of it is drained by the Amoor river and its branches. That part which lies N. of the Amoor was ceded to Russia in 1854. There are 8 considerable lakes, the Hurun, which is 200 m. in circuit, the Pir, and the Kinka, which is 40 m. long and 25 m. broad. There are 3 principal mountain chains. The Sih-hih-tih mountains extend from the boundary of Corea, in lat. 40°, in a N. E. direction, along the sea coast to the mouth of the Amoor. Their average height is 4,500 feet, and they are covered with forests. Between them and the ocean there is only a narrow strip of arable land, which is inhabited by a savage race having little intercourse with the Mantchoos. The southern extremity of this range, from about lat. 48°, bears the Mantchoo name of Kolmin-Shanguinalin, and the Chinese name of Changpeh-Shan or Long White mountains. One of its peaks, called Pecha, is supposed to be 15,000 feet high. The second range is the Yablonoï-Khrebet, which is separated from the Sih-hih-tih on the N. by the valley of the Amoor. Its spurs extend a great distance and bear a variety of names. There are two principal spurs, one N. of the great bend of the Amoor, and the other between it and the Chikiri, one of its affluents. The third range, the Inner Hing-an or Sial-Koi, extends over a great part of Mongolia, and forms in Mantchooria 3 sides of the extensive valley of the Nonni, ending between the Amoor and the Soongari at their junction. Most of these ranges are covered with forests, but very little is known of their height or their natural history. The greatest part of Mantchooria is covered by forests, the abode of wild animals, many of which afford valuable furs. Among them are bears, wolves, tigers, and two peculiar species of deer, the *argeli* and *jiggetai*. The rivers and coasts abound in fish; among which carp, sturgeon, salmon, pike, and shell fish are especially plentiful. The pearl fishery is carried on at the mouth of the Amoor by Chinese soldiers sent for the purpose. The troops of Chinese Mantchooria are required to furnish 2,400 stags annually to the emperor, who reserves for his own use only the fleshy part of the tail as a delicacy. Among the birds of prey is a vulture which in size and fierceness rivals its congener the condor of the Andes. The southern part of Mantchooria is cultivated, and produces wheat, barley, pulse, millet, and buckwheat. It also supports large herds of horses, cattle, and sheep. Ginseng and rhubarb are gathered by soldiers detached for the purpose.—Chinese Mantchooria is divided into 3 provinces, Shing-king, Kirin, and Tsitsihar. Shing-king occupies the S. portion of the country, Kirin all the region E. of the river Soongari, and Tsitsihar the north-west. Shing-king contains two departments, Fung-thian-foo and Kin-choo-foo, subdivided into 15 districts. There are 12 garrisoned posts. The administration of this province is partly civil and partly military, while that of the other

provinces is entirely military. The capital of Shing-king and of all Mantchooria is called Mookden by the Mantchoos, and by the Chinese Fung-thian-foo. It is 880 m. N. E. from Peking, and is a large city surrounded by a wall 10 m. in circuit. Hing-king, 60 m. E. of Mookden, is also a considerable city, and is the family residence and the family burial place of the Mantchoo emperors of China. Kin-choo, on the gulf of Leao-tong, S. W. of Mookden, of which it is the port, carries on a considerable trade in cattle, provisions, and drugs. Its harbor is shallow and unsafe. Kai-choo, another less frequented port on the E. side of the gulf, has a better harbor. Kirin is a very extensive province, and is thinly inhabited by Mantchoos settled in garrisons along the bottoms of the rivers, and by tribes related to the Mantchoos, but less civilized, who subsist principally by hunting and fishing, and are tolerably independent of government control except that they pay an annual tribute of furs. Ningoota is the largest town. The great island of Saghalien is included in this province. Tsitsihar is mostly an uninhabited mountainous wilderness. Its capital is Tsitsihar, on the river Nonni, in lat. 47°; it is a place of some trade, being generally resorted to by the tribes of a vast region. The climate of the greater part of Mantchooria is very severe. One of the early Jesuit missionaries who resided there says: "Although it is uncertain where God placed paradise, we may be sure that he chose some other country than Mantchooria; for of all savage regions this takes a distinguished rank for the aridity of the soil and rigor of the climate." In the northern parts the ground is frozen in winter to the depth of 7 feet, and the mercury is frequently 30° below zero. The administration of Mantchooria consists of a supreme civil government at Mookden, and 3 provincial military ones. There are 5 boards, each under a president.—The Mantchoos belong to the great Mongolian division of mankind, though they are not nomadic or pastoral like the Mongols proper, but occupy themselves with agriculture or hunting according to the circumstances of the part of the country they inhabit. They are of lighter complexion and heavier build than the Chinese, and some of them have florid complexions, blue eyes, aquiline noses, brown hair, and heavy beards. They have the same peculiar conformation of the eyelids as the Chinese, and resemble them closely in other respects; but their countenances are generally of a higher intellectual cast, and their character haughtier and more determined. They are the dominant race in the Chinese empire, and the skill and energy with which they have governed their vast dominions for two centuries show them to be possessed of high qualities. During the same period they have greatly improved the condition of their own original country; and although they have been dispersed over the whole empire as officers and soldiers, their number at home seems to be greater than at any former period. Their courage and resolution

were shown in repeated instances in the war with Great Britain in 1841-'2. At Ohapoo, after the Chinese army was defeated, 800 Mantchoos retired into an enclosed temple, and defended themselves with such desperation that only 50 were taken alive. At Chinkiang-foo the Mantchoos of the garrison made a gallant defence, and when they were overpowered they killed their women and children and then themselves. They preferred to die rather than to surrender, and of a Mantchoo population of 4,000 it was estimated that not more than 500 survived, the greater part having perished by their own hands. When the Mantchoos conquered China, they imposed upon the conquered people a portion of their dress and many of their usages. The mode of arranging the hair in a tail now in use by the Chinese was forced upon them by the Mantchoos, to whom it had long been familiar. On the other hand, they have adopted many of the customs of the Chinese, and Father Huc says, probably with some exaggeration, that you may traverse Mantchouria from the great wall to the river Amoor, without being at all aware that you are not in a province of China. The Mantchoos began to be conspicuous in eastern Asia about the beginning of the 17th century, when after a long series of internal wars their tribes were united into one nation under a chieftain named Tien-tsung, who in 1618 declared war against China, then ruled by the Ming dynasty. He overran and devastated the N. E. provinces, but died in 1627, leaving the prosecution of his design of conquest to his son Tien-tsung, who made alliances with rebels whose leaders pretended to be rightful heirs to the throne. With their aid he made himself master of Peking, and the last of the Chinese emperors, Hwai-tsung, having committed suicide in 1643, the Mantchoo chief took possession of the government. He died in 1644, and his son and successor Shun-chi is regarded as the first emperor of the Mantchoo dynasty which still holds the throne.

MANTEGNA, ANDREA, an Italian painter, born near Padua in 1430 or 1431, died at Mantua in 1506. Of his early history little is known beyond the fact that he was by occupation a shepherd boy, who, having found his way to Padua, was placed under the instruction of Francesco Squarcione. His earlier works necessarily reflect the character of the antique sculpture which he studied in the famous school of that master, resembling colored bass-reliefs rather than paintings; and in his first large picture representing the 4 evangelists, he gave to these sacred personages the aspect of heathen philosophers. About the middle of the 15th century Jacopo Bellini visited Padua, and the conversation and example of this great painter, whose daughter, Nicolasa, Mantegna married, caused him to abate somewhat his predilection for the antique, although he was never able wholly to free himself from its influence. His frescoes in the church Degli Eremitani in Padua, representing the life of St. James and the

legend of St. Christopher, gave the first evidence of his capacity to rise above the cold mannerism of his school and clothe art in the garb of living reality. Rising in reputation in his own city, he was invited about 1468 by Ludovico Gonzaga to Mantua, where, in the service of that munificent patron of art and of his successors, he passed the remainder of his life. During the last 80 years of the century, in which his talents witnessed their highest development, he exercised a sort of patriarchal authority over the painters of northern Italy, sharing with his relatives, the Bellini of Venice, the supremacy in their art, and educating numerous pupils. Between 1485 and 1490 he visited Rome at the invitation of Innocent VIII., and painted with almost miniature-like delicacy a series of frescoes in a chapel in the Belvedere, all of which however perished when Pius VI. destroyed the chapel toward the close of the last century to make room for his new museum. Of his works extant, the principal is the celebrated series representing in 9 compartments the triumph of Julius Caesar after his conquest of Gaul, originally painted for Ludovico Gonzaga, and which upon the downfall of that family were purchased by Charles I. of England. They were sold by parliament with the rest of Charles's pictures, but were repurchased on the return of Charles II., and now hang in Hampton Court. They are painted in distemper on twilled linen, and even in their present faded and dilapidated condition excite the admiration of the beholder by their grand and spirited composition and thorough reflection of the spirit of antique art, the combination of the sculptural style with the aims and beauties of painting being here singularly appropriate. A picture in chiaroscuro, very similar in character and treatment to this, representing the triumph of Scipio, is now in the possession of Mr. Vivian of London. Of his easel pictures the most famous is the *Madonna della Vittoria*, now in the Louvre, painted in commemoration of the victory gained by Gonzaga over Charles VIII. of France in 1495. In composition and color it represents the maturity of Mantegna's powers. Many other pictures by him are to be found in Italy and the large galleries of central Europe, unequal in merit and having more or less of the hardness and meagreness of which he was never able to divest himself, but all displaying unmistakably the hand of a great master. Mantegna also, according to Lanzi, engraved upward of 50 of his own designs, of which about 30 are known to collectors. Among his plates are his own designs for several of the compartments of the "Triumph of Julius Caesar."

MANTELL, GIDEON ALGERNON, an English geologist and palaeontologist, born in Lewes, Sussex, in 1790, died in London, Nov. 10, 1852. He was educated as a surgeon, and embarked in a lucrative practice in his native town. Inclination, however, led him to devote much time to geological researches, and in a few years his discoveries in the wealden formation, the

extraordinary fossiliferous richness of which had been previously little known, gave him a high rank among living palæontologists. To his labors science is indebted for the discovery of 4 out of 5 of the genera of extinct dinosaurian reptiles, viz.: the *iguanodon*, the *hylæosaurus*, the *pelorosaurus*, and the *regnosaurus*; and his valuable museum collected from the wealden and chalk formations, and which was purchased by the trustees of the British museum, contains well preserved fossils of these, and also of many extinct fishes, insects, and plants. In 1825 he was elected a member of the royal society; in 1835 he received the Wollaston medal of the geological society, and in 1849 the royal medal of the royal society. The latter part of his life was passed in London, where he continued his medical practice and geological researches. He was remarkably successful as a lecturer in exciting an interest in scientific pursuits. His chief scientific work separately published is "Fossils of the South Downs, or Illustrations of the Geology of Sussex" (4to., London, 1822). He is also the author of two popular treatises of great merit, "The Wonders of Geology" (2 vols. 8vo., London, 1838), and "The Medals of Creation, or First Lessons in Geology" (2 vols. 8vo., 1844), both of which have been translated into German, and of a number of lesser works illustrating the geology of the British Isles and his own discoveries. In Agassiz and Strickland's *Bibliotheca Zoologia et Geologia*, 67 works and memoirs by Dr. Mantell are cited, beside which he wrote several papers on antiquarian and professional subjects.

MANTEUFFEL, OTTO THEODOR VON, baron, a Prussian statesman, born at Lübben, in the province of Brandenburg, Feb. 8, 1805, of a family which ranks among the lesser nobility of Prussia. He lost his father at the age of 7, but was with his brother educated by an uncle, and completed his studies at Halle, applying himself particularly to jurisprudence and political economy. On leaving the university he took up his residence in Berlin, and was in 1829 attached to the department of finance, and afterward filled important political and judicial offices, in which he displayed so much ability that he was regularly chosen as the representative of Brandenburg at the provincial diet. In 1844 he was attached to the prince of Prussia with the title of privy councillor, and entered the council of state. In 1845 he was placed in the direction of the first, and in 1846 of both the first and second divisions of the ministry of the interior. In 1847, on the convocation of the first united diet of Prussia, he was among the most strenuous opponents of a more liberal policy. On Nov. 8, 1848, he was appointed minister of the interior under Count Brandenburg; and when some kind of order was restored by that military man, he contrived, by an exhibition of administrative ability and a profession of free trade principles, to ingratiate himself to some extent with a large party among the middle and commercial classes. After the

death of Count Brandenburg, Nov. 6, 1850, he became minister of foreign affairs, and took an important part at the conference of Olmütz, Nov. 28 and 29, where, by immediately yielding to Austria on all questions of German policy, he brought about a peaceable solution of the complications between the two governments. On Dec. 19, 1850, he was appointed prime minister, and at the same time retained the department of foreign affairs. On Jan. 12, 1852, he became president of the council of state. His name has been intimately associated with the Russian and ultra-conservative policy of the court of Berlin; he enjoyed the confidence of the king, but was not popular. In 1856 he attended the peace congress at Paris as Prussian plenipotentiary. In 1858, after the establishment of the regency of the prince of Prussia, he was succeeded by Baron Schleinitz in the ministry of foreign affairs (Nov. 6), and by the prince of Hohenzollern-Sigmaringen as president of the ministry and of the council of state.

MANTINEA, one of the oldest and most powerful towns of Arcadia, on the borders of Argolis and the river Ophis. Its democratic political constitution was, according to Polybius, one of the best in antiquity. Like the other Arcadian towns, it acknowledged the Spartan supremacy prior to and during the Persian war. It was an ally of Sparta in the early part of the Peloponnesian war, but in 421 B. C. formed a confederacy with Argos, Elis, and Athens, which was defeated and dissolved by the Lacedæmonians in 418. Though it became again an ally of Sparta, its increasing power rendered it obnoxious to the latter city, and in 385 the Spartans attacked and destroyed it by turning the waters of the Ophis against its walls. The Mantineans rebuilt their city after the overthrow of the Spartan supremacy by the battle of Leuctra in 371. They were prominent in the formation of the Arcadian confederacy, but soon abandoned it for an alliance with their ancient enemies the Spartans. To prevent this coalition Epaminondas marched into the Peloponnesus, and Mantinea is chiefly celebrated as the scene of the great battle (362) between the Thebans and Spartans, in which he fell. It continued one of the most important towns of Arcadia till the time of the Achæan league, which it at first joined, but subsequently deserted for the Ætolian confederacy, an event which occasioned the Cleomenic war. In 226 it was surprised by Aratus, and in 222 it was plundered by Antigonus Doson, and its name changed to Antigonea, which it bore till its ancient appellation was restored by the emperor Hadrian. Its ruins are visible at the modern village of Paleopoli.

MANTUA (It. *Mantova*), a province in northern Italy, now forming part of the Sardinian possessions in Lombardy, watered by the Po and its affluents the Mincio and Oglio, bounded N. by Brescia and the lake of Garda, E. by Verona and Rovigo, S. by Modena and Parma, and W. by Brescia and Cremona; area, 900 sq. m.; pop. nearly 300,000. It is celebrated for

its beautiful scenery and for its fertility. The principal products are grain, flax, hemp, rice, fruits, and wine. Under the Romans it enjoyed a high degree of prosperity. After the downfall of the Roman empire it came into the possession of the Visigoths, and afterward of the Lombards. Under Charlemagne it formed part of the Frankish, and under Otho the Great of the German empire. Subsequently the princes of the Este family and the countess Matilda of Tuscany received it as an imperial fief; and at a later period it was under the rule of the princely families of Mantua, among whom the house of Bonacorsi was the most powerful for about 40 years, until the house of Gonzaga rose to eminence, Ludovico Gonzaga assuming sovereignty in 1328. This family, under whom Mantua became a duchy, contributed greatly to the improvement of art and letters and to the embellishment of the capital. The last duke of Mantua, Charles IV., received a French garrison into Mantua, and fought on the side of France during the war of the Spanish succession. On this account he was put under the ban of the empire by Joseph I. (1705); he died without issue in Padua in 1708, and Austria remained in possession of the territory of Mantua. In 1797 it became part of the Cisalpine and afterward of the Italian republic, and in 1805 of the kingdom of Italy; but it was reunited to Austria in 1814, and belonged to the province of Lombardy, in the Lombardo-Venetian kingdom, until July 11, 1859, when by the treaty of Villafranca the province of Mantua with the rest of Lombardy was ceded by the emperor of Austria to the emperor of the French, to be by him transferred to the king of Sardinia. This cession, however, did not include the fortified city of Mantua and its environs.—MANTUA, formerly the capital of the above province, and still continuing in the possession of Austria, about 80 m. S. E. from Milan and 18 m. by railway S. by W. from Verona, is situated on an island in the middle of a lagoon formed by the Mincio; pop. about 31,000. The swamps and marshes surrounding Mantua are injurious to the salubrity of the city; but, in connection with the formidable works which guard all its approaches and enclose it on every side, they constitute its most important defences, and have made it so strong that it is deemed the bulwark of Italy, and impregnable by any means but famine. The communication between the island and the mainland is maintained by several bridges, the longest of which, the Ponte di San Giorgio, forms the principal approach to the city. The latter is entered by 5 gates, one of which, the Porta Mulina, presents a curious specimen of ancient engineering. Mantua has a desolate appearance, except in some of the central parts, where there is commercial activity. It contains however many fine streets, the Via Larga being the widest avenue. Among the finest squares are the Piazza di Virgilio, surrounded by elegant houses; the Piazza delle Erbe, where the market is held; the esplanade or Piazza di San

Petro; the Piazza del Argine, with a marble pillar crowned by a bust of Virgil, and the square where in 1810 the Tyrolese patriot Andreas Hofer was shot by order of Napoleon. Great masses of buildings, consisting of feudal castles with their battlemented turrets and Lombard arches, extend from the Porta di San Giorgio to the Piazza Delpurgo, and include the ancient palatial castle (*castello de Corte*) of the Gonzagas, now used partly as a prison and partly for public offices. Adjoining it is the immense structure begun at the opening of the 14th century, now comprising the so called Palazzo Imperiale, Palazzo Vecchio, and Corte Imperiale, containing about 500 apartments, and mainly indebted for its present beauty to the genius of Giulio Romano, whose works as a painter and architect form the greatest artistic glory of the city, but are nowhere displayed to greater advantage than in the decorations of this palace. The Palazzo del Te, outside of the city, originally intended for ducal stables, also grew up under the genius of Romano to the dimensions of a vast and magnificent building. The principal churches are the cathedral, San Andrea, and Sta. Barbara, all more or less rich in paintings, particularly the last, which also contains in its sacristy a golden vase attributed to Benvenuto Cellini. San Maurizio contains the "Martyrdom of the Saint," one of the finest works of Ludovico Carracci. The shambles (*beccheria*) and fish markets (*peschiera*) were planned and built by Giulio Romano. Mantua is a bishop's see, and contains a number of educational and charitable institutions, a botanic garden, a museum of antiquities, a library of about 80,000 volumes, an academy of science and fine arts (Virgiliana), now chiefly used as a school of drawing, a chamber of commerce and industry, a *monte di pietà*, a general house of correction, a military arsenal, a theatre, and an elegant amphitheatre. The manufactures are limited, and the principal article of trade is silk. The principal dealers are the Jews, who still live in a separate quarter (*ghetto*).—Mantua is supposed to have been founded by the Etruscans long before the building of Rome. It derives its chief classical celebrity from associations with Virgil, who has celebrated Mantua, as the place of his birth, in several passages of his works. Charlemagne gave it its first fortifications, which in modern times were completed in their present form by the Austrians. In the middle ages Mantua was one of the most important cities in Italy. In 1680 it was seized by the imperialists and subjected to terrible calamities, from which the city has never recovered. In 1796 Gen. Bonaparte, hopeless of reducing the fortress, kept it under strict blockade till famine compelled it to capitulate. In July, 1842, the Jews, who number about $\frac{1}{5}$ of the population, were subjected to great persecutions. In the war of Piedmont with Austria in 1848, the victory depended on the possession of Mantua; it was blockaded for several months by the troops of Charles Albert, who was finally

defeated by Marshal Radetzky in the battle of Custoza (July 25). During the war of 1859 Mantua was again of high strategical importance, as one of the most formidable strongholds of Austria, and, together with the neighboring fortresses of Peschiera, Verona, and Legnago, saved her from being entirely stripped of her possessions in Italy.

MANUEL I. COMNENUS, a Byzantine emperor, born about 1120, succeeded his father, Joannes II., in 1143, died in 1180. The valor which he had displayed against the Turks induced his father to bequeath the crown to him rather than to his elder brother Isaac, who was immediately imprisoned by Axuch, the minister of the deceased emperor. Returning from his campaign in Cilicia, Manuel was received with enthusiasm at Constantinople, but was at once involved in wars both in the East and the West, which lasted with brief intermissions through his reign. In 1144 he subjected Raymond, the rebellious Latin prince of Antioch. In 1145 he defeated the sultan of Iconium in successive pitched battles. In 1147 he promised his aid to the new crusade headed by Louis VII. of France and Conrad III. of Germany, and though he allowed them a passage through his dominions he gave secret information to the Turks. In 1148 he began the most important war of his reign with Roger, the Norman king of Sicily, who had taken Corfu and prepared to invade Greece. He formed an alliance with the Venetians, who within a year joined him before the fortress of Corfu, which was surrendered after an obstinate siege. He was prevented from invading Sicily by hostilities of the Serbians and Hungarians, instigated by Roger, the former of whom were vanquished in two campaigns, but the latter protracted the war till 1152. In that year he suffered a reverse from the Turks in Cilicia, but his general John Ducas gained so great successes in southern Italy that Manuel conceived the project of reuniting the eastern and western empires. The defeat of Alexis, the successor of John Ducas, by William, the successor of Roger, soon followed; the Sicilian admiral Maius routed the Greek fleet off Negropont, and advanced toward Constantinople; and Manuel therefore accepted an honorable peace in 1155. Those Greek prisoners who were silk weavers were retained in Italy, and gave origin to the flourishing Italian silk manufactures. In the following years he waged successful wars with Raymond, prince of Antioch, and Az-ed-din, the Turkish sultan. A new war soon broke out with Gejza, king of Hungary, which was terminated by a disastrous defeat of the Hungarians near the present Semlin. In 1176 he experienced a terrible defeat from Az-ed-din in the mountains of Pisidia, and was obliged to sign a disadvantageous peace. By breaking the treaty and renewing the war he obtained honorable terms. Depressed by this disastrous expedition, he never recovered his former military enterprise and ambition. The

heavy war taxes levied from his subjects during his reign were often employed in pensioning ministers and men of influence at foreign courts, while his troops went unpaid. II. PALEOLOGUS, a Byzantine emperor, born in 1348, succeeded his father Joannes V. in 1391, died in 1425. At the death of his father he fled from the court of the sultan Bajazet, with whom he had been left as a hostage. The consequence was a war with Bajazet, in which Manuel was supported by an army of Hungarians, Germans, and French. The allies, under the command of Sigismund, king of Hungary and afterward emperor of Germany, were defeated at Nicopolis in 1396, with the loss of 10,000 men. Constantinople was besieged, and its fall seemed impending, when the conquests of Tamerlane diverted the arms of the sultan. Manuel visited Italy, France, and Germany, vainly seeking assistance from the western princes. In the conflict between the Tartars and the Turks, he acted with diplomatic skill, and secured peace to his empire. He sent ambassadors to the council of Constance with instructions to urge a union of the Latin and Greek churches; but his real object was only to obtain aid from the kingdoms of the West, and to alarm the Turks by the negotiations.

MANUMISSION, in Roman antiquity, the form by which slaves, or other persons not *sui juris*, were released from their condition. There were 3 modes of effecting a legal release, by *vindicta*, census, or will. The former was the oldest, and as follows: The owner brought his slave before the magistrate, and stated the grounds on which he intended his manumission. The lictor laid a rod on the head of the slave, and declared him free by right of the Quirites; the master, who in the mean time held the slave, pronouncing the words: "I wish this man to be free," turned him round, and let him go (*emisit e manu*, whence the term). The magistrate then declared him to be free. The manumission by census was effected by the slaves giving in their names at the lustral census at the bidding of their masters. By will a slave could be made free conditionally or unconditionally, or free and an heir to the testator. There were various restrictions on manumission enacted by laws at various periods. The act of manumission established the relation of patron and freedman between the manumittor and the manumitted; and if the former was a citizen the latter became a member of his *gens*, and assumed his family as well as personal name, to which he added some other as surname, commonly that by which he was previously known.

MANUSCRIPT (Lat. *manu scriptum*, written with the hand), in bibliography, a written book or paper in distinction from printed matter. Prior to the invention of printing all literature was contained in manuscripts. Monumental writing, which covers the walls of ancient Egyptian and Assyrian edifices, preceded the general use of

paper made from the Egyptian papyrus. Plates of lead, tablets of wax, palm leaves in India, and parchment made from skin were all known, but were less in use than the papyrus during the period from the conquests of Alexander to those of the Saracens. In the 7th and 8th centuries the changes which had occurred in the East rendered the exportation of papyrus difficult, and it became rare in western Europe. The monasteries therefore were obliged to employ parchment, which on account of its greater cost had been previously used only for copies of special elegance. Its expense, too, caused transcribers to efface the pagan writing on ancient parchment, in order to employ it again for antiphonaries, missals, legends, and monastic records. This custom of palimpsest writing continued till the 14th century. About the 10th century paper made from cotton was invented at Byzantium and introduced into the West. The manufacture of paper from rags, one or two centuries later, first furnished a material for writing as cheap and convenient as the ancient papyrus.—The Greeks and Romans committed the care of transcribing principally to slaves, called by the latter *serri literati*, who were esteemed of great value when they excelled in the art. There were also at Rome professional scribes, some of whom were women. When in 381 Origen undertook the revision of the Old Testament, St. Ambrose sent to his assistance a number of deacons and virgins skilful in calligraphy. In the middle ages copying was almost exclusively in the hands of ecclesiastics, who were called clerks (*clerici*). The *scriptorium* of monasteries was exclusively devoted to this purpose. The Benedictines especially excelled in the care with which they copied and preserved manuscripts.—No parchment manuscript existing is believed to be of an earlier date than the 11th century. Few of the millions of volumes in ancient Italy and Greece survived the devastations of the northern barbarians, the papyrus having been far less firm and durable than modern paper, and parchment having been rarely employed. Five parchment pagan manuscripts, four in Latin and one in Greek, are ascribed to the 4th or 5th century. About as many Christian manuscripts are of the same age. Of the former, there are copies of the works of Virgil, one of which is in the Vatican and the other in the Medicean library at Florence, both adorned with illuminations of various colors. The third is a Roman calendar of about A. D. 354, adorned with illuminations for the 12 months. The fourth is the tablet of Pentinger, described by Niebuhr and Mannert. The Greek manuscript is a copy of Dioscorides, described by Lambecius, abounding in illuminations, some of which are probably of later date. In 1825 a fragment of the Iliad, written in capitals on papyrus, was found in the island of Elephantine, in Upper Egypt, which some esteem the oldest of all ancient books. Among the Christian manuscripts of the 4th or 5th century is the Gospel of St. Mark, on papyrus, at Venice; the Bible

of Ulfilas, in Sweden; and the so called Alexandrian manuscript, written in capitals on vellum, and now in the British museum. It was copied, according to its prolegomena, by Thecla, an Egyptian lady, was in the possession of the patriarch of Constantinople in 1098, was there presented to the ambassador of Charles I. of England, and was published by Dr. Woide and the Rev. H. H. Baber (London, 1786–1828). The ornaments and illuminations are the most curious features of mediæval manuscripts. The initial letters and words of chapters and other principal divisions assumed most diverse and fantastic forms. They often covered a whole page, representing men, animals, plants, and fruits with grotesque deformities. Gothic illustrations, vignettes, and colored or gilded initial designs were so common that it was charged that *hodie scriptores non sunt scriptores, sed pictores*. Letters of silver or gold were introduced, and many words were colored purple, red, or violet. The parchment prepared for the most precious, especially for sacred books, was often colored blue, and the writing was in gold or silver.—In examining a manuscript, the points to be chiefly considered are: its antiquity; the distinction between the different styles of writing prevalent in different countries and times, of the greatest value in determining the age of manuscripts older than the 13th century; the miniatures, vignettes, and arabesques which accompany it; the metallic and other liquors used; the covering, the material and ornamentation of which is often interesting both to the antiquary and the artist; the character of the contents; and the beauty of the execution. Among the signs for determining their antiquity are the following: in the manuscripts previous to the 8th century there is no space left between the words, so that the lines are entire, presenting an uninterrupted series of letters; the period or dot is unusual, and when employed is placed above the letter and not in the line; before punctuation was introduced, a slight space was left between complete clauses; commas did not come into use till the close of the 10th century; the interrogation and exclamation points and the parentheses were not employed till the 15th century; abbreviations are rare prior to the 8th century, but were so common subsequently as to render many manuscripts almost unintelligible, and they abound in the earliest specimens of printing. The presence or absence of the Greek accents decides nothing as to antiquity. Most manuscripts bear no chronological mark, and their age must therefore be determined by other indications, especially by the mode of writing. Those written entirely in capitals are not later than the 8th century; those entirely in uncials are prior to the 10th; those in uncials are more modern in proportion as the titles of chapters and the initials are more highly adorned. The cursive Roman style became the Lombardic and Merovingian in the 6th century, and inclined in the 10th toward the Gothic. The repetition at

the foot of every page of the first word on the following page belongs to the 12th and subsequent centuries. The Arabian numerals first appear in writing near the beginning of the 12th century.—In form, manuscripts are either rolls (*volumina*) or consist of bound pages like printed books (*codices*). The page is usually quarto, rarely folio or octavo. They constitute the most valuable portion of many modern libraries, the original autographs of mediæval and modern works being in many cases preserved. Their collation is of the highest authority in determining disputed texts. The science of reading and judging concerning ancient manuscripts and documents is called *diplomatica*, and is a branch of *paleography*. The principal collections of manuscripts in European libraries have been catalogued and described.—See Montfaucon, *Bibliotheca Bibliothecarum Manuscriptorum Nova* (2 vols., Paris, 1789); Ebert, *Handschriftenkunde* (2 vols., Leipzig, 1825-'7); and *Paleographie universelle*, with facsimiles by J. B. Silvestre, and descriptions by Champollion-Figeac and Aimé Champollion (Paris, 1840).

MANUTIUS (MANUZIO). I. ALDUS, called the Elder, the first of a well known family of Italian printers, born in Bassiano, Papal States, about 1449, died in Venice in 1515. He was deeply versed in classical literature, and about 1490 established a printing press in Venice, which soon became celebrated for the variety and excellence of the works issuing from it. In 1594 appeared his edition in Latin and Greek of the "Hero and Leander" of Musæus, followed within a few years by editions of Plato, Aristotle, Herodotus, Pindar, the Greek dramatists, &c., many of which were printed from original manuscripts procured from distant countries at considerable expense. His Latin editions, published subsequent to 1500, and commencing with Virgil, are printed in a character cast, it is said, in imitation of the handwriting of Petrarch, and now called *Italic*; and the editorial labors of the publisher were shared by a society of learned men who met at his house and formed what was called the Aldine academy. These impressions are said to be more correctly printed than the Greek. In 1506-'7 he suffered by the wars in which Venice was engaged, but subsequently pursued his avocation with industry and success until his death. Beside the numerous prefaces and dissertations in Greek and Latin embodied in his publications, he produced grammars of the Greek and Latin languages, a Greek-Latin dictionary, translations, &c. The title pages of his books have a device representing a dolphin coiled about the shank of an anchor, on either side of which are the syllables *Al* and *Dvs*. II. PAULUS, youngest son of the preceding, born in Venice in 1512, died April 6, 1574. He was a man of equal learning and critical ability with his father, and was distinguished by the correctness of his editions of the Latin classics, particularly of his Cicero, with prefaces, notes, and an index. Failing to receive adequate patronage in Venice, he repaired about

1562 to Rome, and was for some time employed in editing and printing the manuscripts of the church fathers deposited in the capitol. He returned to Venice in 1570, but died in Rome in poverty. He published a Latin translation of the Philippics of Demosthenes, and a number of original works in Latin and Italian, which entitle him to rank among the most polished writers of the 16th century. III. ALDUS, called the Younger, son of the preceding, born in Venice in 1547, died in Rome in 1597. He published at the age of 11 a collection of choice specimens from Latin and Italian authors, and 8 years later produced a treatise on Latin orthography, *Orthographia Ratio*, founded on inscriptions, medals, and manuscripts. Notwithstanding these evidences of precocity, his mental capacity and attainments were inferior to those of his father or grandfather; and in consequence of his neglect to employ competent persons to superintend his publications, they are the least valuable of all emanating from the Aldine press. He resigned his press in 1584 to one of his workmen, and during the remainder of his life was professor of belles-lettres successively in Bologna, Pisa, and Rome. He published a number of works in Latin and Italian, beside commentaries on Horace, Cicero, &c.—A complete list of the publications of the Aldi may be found in Rénouard's *Annales de l'imprimerie des Aldes* (8d ed., 8vo., Paris, 1884). (See ALDINE EDITIONS.)

MANZONI, ALESSANDRO, count, an Italian poet and novelist, born in Milan in 1784. His father possessed little cultivation; his mother was a daughter of the distinguished philosophical economist Beccaria. As a child he came under his grandfather's influence, and became familiar with the reigning French ideas. He studied with excellent success, first at Milan and afterward at Pavia, where he was an enthusiast for Alfieri, Monti, and Foscolo. In 1805 he went with his mother to Paris, and was received into the society of Auteuil, then including Volney, Cabanis, Garat, De Tracy, and Faurel, with the last of whom he became particularly intimate. The sudden death of a friend furnished the subject of his first poem, in blank verse, entitled *In morte di Carlo Imbonati* (Paris, 1806). Returning to Milan in 1807, he married in the following year the daughter of a banker of Geneva, and published in 1809 his mythological poem *Urania*. His education and residence in Paris had led him to imbibe infidel opinions, and his wife belonged to the Calvinistic church; but both now became devout Roman Catholics. The change was announced by his *Inni sacri* (Milan, 1810), a collection of lyrics on the nativity, the passion, the resurrection, pentecost, and the assumption, marked by fervent and elevated piety. The romantic school of Germany, inspired especially by the Schlegels, which sought the materials of literature in mediæval sources, was now exerting an influence in Italy as well as France. Manzoni was one of those who sought to revive the na-

tional literature by renouncing classical subjects and laws, and by adopting the spirit, intensity, and irregularity of mediæval romance. In 1820 appeared his romantic drama *Il conte di Carmagnola*, dedicated to Fauriel, which violated the unities of time and place, but was remarkable for its simplicity of plot and purity of style. It attracted attention throughout Europe, was severely criticized, was admired by Goethe, and was defended by the author in a letter written in French *Sur l'unité de temps et de lieu*. It was followed in 1823 by another tragedy, *Adelchi*, which has more striking dramatic effects, and is especially admired for the lyrical choruses introduced into it in the manner of the Greek drama. Meantime, on occasion of the death of Napoleon, he published an ode, *Il cinque Maggio* (1821), one of the finest modern Italian lyrics, in which, to the surprise of his Catholic and royalist friends, he highly exalted the emperor. His greatest success was achieved by the novel *I promessi sposi* (8 vols., Milan, 1827), a Milanese story of the 17th century, which was translated into the principal languages of Europe. It is a touching delineation of village and rustic life, all the characters in which are original, are clearly and vigorously conceived, and have remained popular. It exhibits in different portions a remarkable variety of style. In an illustrated edition (Milan, 1842), he added to the original text a *Storia della piagnola infame*, in which he gives an account of the executions caused by the popular superstition during the plague of 1630, and touches upon some of the highest questions of social economy. It was believed that the disease was propagated by persons who anointed the walls of houses with a fatal poison, and many of these wretches were tortured and executed with horrible cruelty. In 1834 he wrote *Osservazioni sulla morale cattolica*, in reply to Sismondi's depreciation of the moral influence of the Catholic church in the middle ages; it was translated into English (London, 1836). After the success of *I promessi sposi* Manzoni almost renounced profane literature to gratify his taste for domestic life and pious contemplation. He has lived for about 30 years in retirement, mindful neither of his own fame nor of public interests, and cherishing only inward peace and the practice of virtue. He married a second time in 1833, and has been afflicted by the death of all his children, the last dying in 1856. He resides at Brusano, near Milan. Whether as a lyrical poet, a tragic dramatist, or a novelist, he has exercised less influence upon any department of literature than upon the Italian language, to which he has contributed to give ease, variety, and unity. His *Promessi sposi* has been translated in England, and republished in America, under the title of "The Betrothed Lovers."

MAP (Lat. *mappa*), a representation of a portion of the earth's surface, or of the celestial sphere, upon a plane. Its object is to present to the eye the bearings of objects upon the surface from each other, and their relative dis-

tances apart, as nearly correct as may be. But this can be done with accuracy only upon a globe, the surface of which is similar to that of the earth itself. Various plans, however, have been devised by which in the more convenient form of plane sheets true delineations of the surface are presented, reference being had to the principles upon which these maps are constructed. By the method called projection, the rules of perspective are applied to the delineation of objects upon the surface according to four principal modes. In the method of projection called orthographic, the eye is supposed to be at an infinite distance from the sphere, so that the rays of light coming from every point of the hemisphere opposite to it may be considered as parallel to one another. The sphere is intersected through its centre by a plane perpendicular to these rays, and it is upon this plane that the objects are projected, as their shadows might be cast upon it from the sun through a transparent medium. Objects near the centre of the plane would by this method be delineated in nearly correct proportions; but in receding from this, as the rays strike more obliquely upon the surface of the sphere, their projection becomes more and more distorted, and the parallels of latitude or meridians of longitude (as the eye is placed opposite the pole or the equator) are drawn more and more closely together.—In the stereographic projection, the eye is supposed to be placed at the surface of the sphere, and the surface to be delineated is the opposite hemisphere or a portion of it, of which the inner or concave side is presented to the eye. The plane upon which the objects are projected is supposed to be transparent, and placed so as to pass through the centre of the earth, its surface perpendicular to the line passing from the eye to the centre. In this method the meridians and parallels intersect each other as they do upon the globe; and though there is distortion increasing from the centre, it is less than by some of the other methods. The stereographic method is much used for the maps of the world drawn in two hemispheres; and the meridian of 20° W. from Greenwich is usually selected for the plane of projection, because this throws the two great continental divisions of the earth into their respective hemispheres.—In the central or gnomonic projection, the eye is supposed to be at the centre of the earth, and the objects upon the surface are projected upon a plane which is a tangent to its surface. This method is obviously applicable to maps of a limited extent only; and except for maps of the polar regions, where the parallels of latitude are concentric circles, and the meridians are straight lines, they are troublesome to execute on account of the irregular curves the parallels assume.—In the globular projection, the eye is supposed to be at a distance from the sphere equal to the sine of 45°; or, the diameter being 200, this distance is 70.7. In order, however, that the meridians may intersect the equator at equal distances, the distance for the eye is generally

fixed at $59\frac{1}{2}$, the diameter being 200.—Maps are also constructed upon the principle called development, which is a mode of projecting the forms upon the surface of the earth upon the inner surface of a cone or of a cylinder, which is supposed to envelope the earth and touch it only around the circle which is to be the middle latitude of the map. The points on the earth's surface being projected by other lines drawn through them from the centre, the inner surface of the cone or cylinder is afterward supposed to be unrolled or developed, and thus present the various objects upon a plane surface. Those situated nearest the middle latitude will be most correctly represented. In the use of the cylinder the latitude circles and meridians appear as parallel straight lines, and thus most correctly represent for nautical purposes the angles at which they are cut by objects moving over the surface on any other lines. This principle is in part the foundation of the projection known as Mercator's, and applied by him to charts for navigators, in which the correct bearings of objects upon the surface are of more importance to determine than the true figures of countries.—Maps are also constructed upon other principles according to the special purposes for which they are designed. In maps of small areas, the figure of the earth may be neglected, and the positions and forms of bodies be represented as if the surface were itself a plane. Some have special objects in view, as the delineation of the coast lines, channels, shoals, reefs, lighthouses, &c., upon what are called hydrographic maps or charts; others are intended to show the political divisions of states, counties, and towns; and others to represent the natural features of a country, as its mountains, hills, rivers, plains, &c.; for all of which certain conventional signs are adopted. Maps of this character are designated topographical. Maps have also been constructed to represent the courses of the winds and of oceanic currents over the surface of the earth; to designate the position of the isothermal lines; to indicate the geological formations found in different regions; and others to indicate the flora and the fauna of different countries. In the construction of geographical maps covering large areas, the principal places are located according to their latitudes and longitudes, and the lines of coasts and of countries, roads, &c., are plotted from the most exact surveys that have been made. Those which have been conducted under government patronage have furnished the materials for the best maps, and these are constantly improving as new materials are collected. Of the United States, the most complete maps are those of the state of Massachusetts made by order of the legislature, and of the coast survey under the general government. The great lakes, more especially on the Canadian side, have been surveyed and mapped with great accuracy by Lieut. Bayfield of the royal army, whose operations, extended down the St. Lawrence, are still carried on in

the gulf at its mouth. Maps of the Spanish provinces in America have been made by the Spanish hydrographical depot in Madrid; and Brazil and other South American states have executed maps of their territories.—Of the early history of maps little is known. The art of constructing them no doubt commenced with rude delineations, such as people of barbarous nations now present to picture the geography of places with which they are familiar. The ancient Egyptians had some knowledge of maps, as Sesostris caused the territories he possessed and had conquered to be represented upon tablets for the instruction of his people; and the Israelites appear to have acquired the same knowledge, from the record, in Josh. xviii. 6, of a map of the country being ordered by that lawgiver. In the works of the ancient Greeks no allusions are found to maps, though it is believed they had some knowledge of them from the Phœnicians, who made use of them in navigation. The first map of the world, as known to the ancients, is said to have been made by Anaximander the Milesian. Herodotus makes mention of maps constructed by the Persians in the time of Darius, and of one of Aristagoras of Miletus. The progress made by Eratosthenes in determining the true figure of the surface and representing the correct positions of places upon the terrestrial surface is referred to in the article EARTH. He introduced the lines of latitude and longitude, and the use of these was established by Hipparchus upon a mathematical principle. Still, for want of exact surveys, and owing to the dependence of geographers upon the reports of travellers and their *itineraria picta*, or painted itineraries, the maps afterward made were extremely inaccurate. Even those of Strabo and Ptolemy, of which the latter for centuries were the chief authorities in geography, contained most extravagant errors, such as giving to the Mediterranean 1,400 miles greater length than belonged to it; and what is still more extraordinary, this exaggeration and others of similar character were continued in all the maps from that period down to the commencement of the 18th century. The system upon which Ptolemy's maps were drawn was that of stereographic projection. After the discovery of America, the early maps representing the position of the new world relative to the old were exceedingly inaccurate. In one published in Venice in 1546 Asia and America are joined together in lat. 88° . The great difficulty was in determining the true longitude of places; and until this could be done there was no means of avoiding such errors. The first step toward this object was made by Galileo in 1610, in applying the eclipses of the satellites of Jupiter to this determination. Cassini greatly perfected this system, and published a set of tables in 1668. In 1700 De Lisle published a new map of the world, and others of Europe, Asia, and Africa, founded on comparatively accurate astronomical observations, and in them the errors introduced from the maps of the an-

cients were first corrected. D'Anville, Picard, and La Hire were also distinguished geographers of this period, and employed by the government of France to correct the map of the country. The true system of map making may be considered as at that time established.—Maps were first engraved on metal by Bückink and Schweynheim in 1478, and on wood by Holl in 1482. An "Essay toward a Circumstantial History of Maps," by Hauber, was published in Ulm in 1724. A historical account of the art is also given in a series of lectures by Mr. J. G. Kohl, published in the annual report of the Smithsonian institution for 1856-'7. See also Santaran, *Essai sur la cartographie pendant le moyen âge* (3 vols., Paris, 1849-'52).

MAPES, or MAP, WALTER, an English scholar and Latin poet, born about the middle of the 12th century, probably in Herefordshire, died about the beginning of the 13th. He studied in Paris, and after his return became a great favorite on account of his learning and courtly manners, especially with Henry II., by whom he was sent on a mission to the French court, and to the council summoned by Pope Alexander III., at which he was called on to refute the deputies of the Waldenses. He received several livings, was made canon of the cathedrals of St. Paul and of Salisbury, and finally became precentor of Lincoln and archdeacon of Oxford. His tastes were however for elegant literature, and he is only known at the present day as a genial, festive, and satirical writer, to whom is attributed a great portion of the humorous rhyming Latin Leonine lyrics and Norman French romances of the latter half of the 12th century. Of late years it has been doubted whether Mapes was really the author of the poems which pass under his name, but the fact that they were for several centuries so generally attributed to him has been thought to prove that he excelled in a peculiar style of writing, and that a part of them at least are his. He also wrote much prose both in Latin and Anglo-Norman. Among the former is his *De Nugis Curialium*, a work containing much curious information of a very varied character; and among the latter are a large portion of the existing romances of the round table. For a translation of Mapes's most celebrated lyric, *Mihi est propositum*, see BACCHANALIAN SONGS. The "Latin Poems commonly attributed to Walter Mapes" were printed in London by the Camden society in 1841, and the work *De Nugis Curialium* in 1850.

MAPLE, a genus of trees of the natural order *acerineæ*, with rather inconspicuous flowers, which either have stamens only or pistils only, or both united in the same flower; leaves in all cases simple; fruit double, each division containing a one-seeded cavity and extended into a kind of wing called the key or *samara*. In the "Penny Cyclopædia" 84 species are given as natives of various parts of the world; and London in his *Arboretum Britannicum* mentions 19 species as sufficiently hardy for experimen-

tal planting in Great Britain. Ten species are enumerated by Torrey and Gray in the "Flora of North America" as belonging to the United States. Several of the most valuable kinds are indigenous to New England, while others are found ranging from Canada to the Rocky mountains, and southward to Carolina and Florida. Many of the European species seem well suited to the northern states, and flourish under cultivation. Thus the sycamore maple (*Acer pseudo-platanus*, Linn.) is a noble tree, which grows to great perfection in Italy, acquiring a height of 60 feet. According to Emerson ("Report on the Trees of Massachusetts"), it is remarkable for its rapid growth in this country, sometimes attaining a height of 100 feet. The Norway maple (*A. platanoides*, Linn.) belongs to the north of Europe, but grows as readily here as our native species. It is a fine tree, with very handsome, glossy, deep green leaves. Its wood is valuable for turners' work, and its sap is saccharine. There are two varieties much prized by gardeners, the one called silver-striped and the other cut-leaved, having a jagged and deeply incised foliage. The common European maple (*A. campestre*, Linn.) is in England scarcely more than a bush or small tree of inelegant appearance, and its wood is of little value; but in the southern regions of the Caucasus, as we are assured by Pallas, it is a handsome tree, its wood being hard and valuable for various manufacturing purposes. A small tree of similar appearance is the Montpellier maple (*A. Monspeulanum*, Linn.), growing naturally in dry, stony situations in France. The Tartarian maple (*A. Tataricum*, Linn.) is an ornamental tree 20 feet in height, indigenous to the southern provinces of Russia in Asia, and called by the Calmucks *sarya-modon* or locust tree; they prepare an astringent beverage from its fruit, which when mixed with an abundance of milk and butter forms a favorite article of diet. In Thunberg's *Flora Japonica* are 6 species given as indigenous to Japan. A small evergreen species is known as the Candian maple (*A. Creticum*, Linn.), having flowers in erect clusters, and leathery, glossy, smooth, 3-lobed leaves; it is found growing wild on the mountains of the Grecian archipelago, and is thought to be very handsome. A similar but smaller species, sometimes seen in European collections, is the variable maple (*A. heterophyllum*, Willd.), with a very glossy sub-evergreen foliage; it attains a height of only 8 or 10 feet, and is tender and delicate. Under long cultivation from seeds and by a disposition to sport, many singular varieties and variations have been from time to time produced from the maples, of which the most singular is the "eagle's claw," a variety of the Norway maple, seen in our gardens and much prized. Varieties with spotted or variously cut leaves are also well known.—Of the American maples, we may mention in order, following Torrey and Gray, the moose wood or striped maple (*A. Pennsylvanicum*, Linn.), a beautiful little tree, usually growing from 12 to

20 feet high. The stems or trunks become curiously striped in long, longitudinal lines; the branches are of a beautiful green; the buds and young leaves on expanding are of a delicate rose color; the leaves are placed opposite to each other; the flowers are in graceful pendulous racemes; the fruit is in hanging clusters. This species is much admired especially for ornamental planting, and according to Michaux its size may be increased to 4 times its natural proportions by grafting it upon the sycamore maple. Loudon recommends it for the same purpose. Its natural range of growth is between lat. 43° and 45°. The term moose wood is given to it in Maine because there it forms the favorite food of the moose in its winter browsings. The mountain maple (*A. spicatum*, De Lamarck) is a slender, small shrub, from 6 to 10 feet in height. Its leaves are heart-shaped at base, coarsely toothed, downy beneath, divided into 3 to 5 lobes, which end in sharp points; its leaf stalks are very long, and become purple in September. The flowers are borne in many-flowered racemes, and are small and greenish; the fruit is often reddish. This species has nearly the same range as the last. The large-leaved maple (*A. macrophyllum*, Pursh), a native of the N. W. coast, is perhaps the most conspicuous of the American species; it occurs in Oregon, and is common along the alluvial banks of rivers between lat. 40° and 50°. According to Mr. Douglas, it is one of the most graceful of trees in the country it inhabits, varying from 40 to 90 feet in height, and from 6 to 16 feet in the circumference of its trunk. Its leaves, as its name imports, are very large, but variable in size upon the same tree, very deeply 5-lobed; its flowers are rather large, yellow, and fragrant. Its wood is soft, but beautifully veined, resembling, says Nuttall, the curled maple. It was introduced into England in 1812, and propagated from layers. Growing in company with this tree is the round-leaved maple (*A. circinatum*, Pursh), ranging from lat. 43° to 49°. Its trunk rises to the height of 40 feet; its bark is smooth, its wood fine, white, and close-grained, taking a good polish, and presenting a beautiful curled appearance of texture. The smooth maple (*A. glabrum*, Torrey) is a small shrub, occurring in the Rocky mountains about lat. 40°; its leaves are similar to those of the common currant in size and shape; its fruit smooth, with very short, broad, diverging wings. Closely related, and perhaps only a variety, is the 3-parted-leaved maple (*A. tripartitum*, Nutt.), a shrub occurring in the Rocky mountains near the line of Upper California. —The sugar maple (*A. saccharinum*, Linn.), known also as the rock maple, is when young a beautifully shaped tree; but when older it assumes a great variety of forms. Soils seem to affect the style of growth to a remarkable degree. Emerson says that it forms a broad pyramidal top on moist hills and mountain sides; on the plain, in moist, deep, clayey soils, the top assumes the shape of a massive cylindrical col-

umn of great height, often 70 or 80 feet; in the forest it assumes its most remarkable appearances, with various configurations of outline and direction of branches. The foliage of the rock maple consists of strongly heart-shaped, 5-palmately dividing lobes; the leaves are of a bright green and smooth on the upper surfaces, and of a pale glaucous hue beneath; they differ on different trees in intensity of color. Its autumnal tints are brilliant, golden or splendid orange, sometimes bright scarlet or crimson, and they are the first to appear in the landscape. The flowers are yellowish green, pendulous upon thread-like hairy pedicels, one or two inches long. The fruit is also borne upon long pendulous footstalks, which are simple or compound with several pairs of opposite branches. The species extends from lat. 40° N. into Canada, and westward to the Rocky mountains; it is most abundant in the New England states and the country immediately N. and S. of them. The wood of the rock maple is of remarkable beauty and of great variety of appearance; the kind called curled hard maple has sinuous courses of fibres, giving a changeable surface of alternate light and shade; the bird's-eye maple has numerous contortions of its fibres into little knots looking like the eye of a bird. Both these kinds, when polished, are of exquisite appearance. The wood is employed for a great variety of useful purposes, for ornament and durability, and even in naval architecture its timber is ranked next to oak; for fuel it is second only to hickory. It is the species preferred in the making of sugar, its sap containing more crystallizable sugar than the juices of the other maples, or of birches, lindens, hickories, or walnuts. A tree of about 6 feet diameter has been known to yield a barrel of sap in the course of 24 hours; the average run is from 12 to 24 gallons each season. Carefully made and purified, maple sugar is identical in its composition with that of the sugar cane. The rock maple is much employed for ornamental planting upon highways and in streets, not requiring any extra care for success. The black sugar maple (*A. nigrum*, Mx.) is considered by Torrey and Gray as identical with the preceding species.—The white maple (*A. dasycarpum*, Willd.) occurs upon the banks of rivers in Maine and Vermont to the upper and middle parts of Georgia, but most abundantly in the western states. Its trunk is low, but the spread of its branches is so magnificent as to recommend it for an ornamental tree. Its foliage is finely cut, of a deep rich green on the upper surfaces of the leaves and of a silvery white hue beneath; the flowers appear in April before the leaves, and are small and of a pale yellowish purple. The ripened seed vessels (*samara*) are large, thickened, and have wings 2 or 3 inches long, somewhat downy, but much more so when young. The species was introduced into Great Britain in 1725 by Sir Charles Wager, whence it there bears his name. Lindley says it is extremely common in all the

plantations of Europe, where it is conspicuous for the deep crimson hue of its leaves in autumn. It is called by European nurserymen the cut-leaved scarlet maple; but in the United States it usually bears the name of silver maple or soft maple. We have seen on the banks of the Connecticut river beautiful specimens of this tree, with broad, spreading branches, and a light, thin, graceful foliage, allowing the sunshine to penetrate and to produce flickering shadows upon the ground.—The swamp maple, or the scarlet, the soft maple, the white maple, and the red maple (*A. rubrum*, Linn.) are all one and the same species, as these several names are given to the same tree in different districts. It grows abundantly in swamps, and is widely diffused over the United States. It is usually a rather low tree, of less beauty of shape than the other species. Its trunk, however, sometimes rises to the height of 60 or more feet, and its diameter may be 8 or 4 feet. Its wood is close-grained, and the fibres often curl or have a wavy course, rendering it very ornamental in cabinet work. It is much esteemed for fuel, but its sap affords little sugar. It is seen in its greatest beauty in April or May, when its rich crimson flowers expand; they are small, on short pedicels, which lengthen, however, as the flowering advances. The young twigs are of a bright purple or reddish color and dotted with brown. The leaves are commonly 3 or 4 lobed, and usually heart-shaped at base. In the autumn they assume the richest hues and tints; and sometimes in overflowed swamps the foliage of some one tree is gorgeously colored early in August. The tree is well adapted for shade or ornament, especially in moist soils.—The maples are all easy of cultivation from seeds or from layers. The seeds should be gathered as soon as ripe, and either sown immediately or kept in moist sand during the winter, sowing the next spring. The rarer and more curious sorts can be grafted upon the more common, and thus propagated to advantage. The bark of some of the species is used for producing permanent dyes of brown and yellow; it also contains some astringent principles.

MARABIOS, a range of volcanoes in Nicaragua, extending from Lake Managua N. W. to the bay of Fonseca, consisting of the cones or peaks of Momotombo, Axusco, Santa Clara, Las Púas, Telica, and El Viejo. These mountains are distinct from each other, and rise sheer from the plain, with level spaces between them. At the time of the Spanish conquest several of them were active, but at present only Momotombo shows signs of life.

MARABOU, the popular name of several large birds of the stork family, of the genus *leptoptilus* (Lesson), natives of Asia and Africa, whose delicate vent feathers were formerly highly esteemed as ornaments. The *L. argala* (Lath.), the Asiatic marabou or adjutant, has no equal in size except among the ostriches; the length from the point of the bill to the claws is 7½ feet, and the expanse of wings is nearly 15

feet; it stands 5 feet high. The bill is about 2 feet long, straight, strong, and sharp-pointed; the wings long and ample, the tail moderate and broad, tarsi strong, and toes long, the anterior webbed at the base. The head and neck are nearly bare of feathers, and in front of the neck hangs a pouch or dewlap several inches long and capable of considerable distention. The bill is yellowish white, and its gape is such that it can swallow whole an animal as large as a cat; front of the neck yellowish, back of neck reddish with a few hairy warty excrescences; the back and wing coverts deep bluish ash, wings dusky, breast and belly dusky white; the feathers of the sides beneath the wings, and those of the vent and under tail coverts, are whitish, downy, about 12 inches long, and so light and delicate as to command a high price for ladies' head dresses; a feather a foot long and 7 inches wide weighs only 8 grains. It is common in Bengal; it stalks about majestically, and each is believed to be possessed by the soul of a Brahmin and therefore invulnerable; it is called adjutant from its resemblance at a distance to an officer with white waistcoat and breeches. Its voracity is extreme, exercised upon anything which comes in its way, from offal, fish, and reptiles, to birds and quadrupeds, and even to the cooked meats of the natives; its services are valuable as a scavenger, and its presence is encouraged; it has even been domesticated. In the wild state, they live in small flocks near the mouths of rivers; their power of flight is great, and their vision very keen. A smaller species (*L. marabou*, Temm.) occurs in tropical Africa, assisting the vultures in consuming the filth of the negro villages; it is more ugly, if possible, than the Asiatic bird, and its delicate plumes are equally valued; *marabou* is the native African name. Other species are described, with similar characters.

MARABOUT (Arab. *marbouth* or *morabeth*, hermit or saint), a name given to religious devotees among the Mohammedans of the Barbary States. Originally it appears to have been applied in its plural form to a tribe or sect of Arabs who established themselves in the deserts of northern Africa, and were distinguished for religious enthusiasm. Throughout the Barbary States the tombs of the Marabouts are conspicuous objects, being generally built in the open country, and regarded by the people with much reverence. The living Marabouts frequently affect to work miracles, and some of them are held in high esteem, while others are regarded as little better than vagabonds.

MARACAYBO, **MARACAIBO**, or **NUEVA ZAMORA**, a seaport of Venezuela, and the capital of a province of the same name, situated on the W. shore of a channel which connects the lake and gulf of Maracaybo, in lat. 10° 41' N. and long. 71° 49' W.; pop. 14,000. It is built on a dry sandy soil, and its houses are generally constructed of chalk and sand or of wood and thatched with reeds. The climate is very sultry, and violent storms and earthquakes are often ex-

perienced. The city has also suffered from many destructive fires. The inhabitants are mostly engaged in ship building and navigation, but there is also an active trade with the provinces of Merida and Truxillo and with New Granada. The harbor is safe, deep, and well fortified, but obstructed by a shifting bar at its mouth, on which there is only 10 feet of water at high tide.

—**MARAUAYBO, LAKE OF**, a large lagoon forming the most extensive sheet of water in South America; length, 100 m.; greatest breadth, 80 m. It is oval in form, and lies immediately S. of the above described city. The channel connecting the lake with the sea is 14 m. long and from 4 to 14 m. wide, and deep enough except over the bar at its mouth for the largest vessels. The shores of the lake are low and barren, and at certain seasons are inundated to a distance of 10 or 20 m. Its waters, being fed by over 500 small streams, only about 100 of which however are perennial, are generally fresh. On the N. E. shore is a mine of mineral pitch which sends out at night a brilliant phosphoric light.—**MARAUAYBO, GULF OF**, or gulf of Venezuela, an inlet of the Caribbean sea on the N. coast of Venezuela, extending N. and S. a distance of 75 m., and E. and W. 150 m. On the E. lies the peninsula of Paraguana, to the S. of which is that part of the gulf called El Golfete. At its opening, between Cape San Romana and Punta Espada, the gulf is 60 m. wide.

MARANHÃO, or **MARANHAM**, a province of Brazil, bounded N. by the Atlantic, E. and S. E. by Piahi, S. W. by Goyaz, and N. W. by Grão Para; area, 96,000 sq. m.; pop. in 1856, 860,000. The river Parnahiba forms the E. frontier, various affluents of the Tocantins rise on the S. W. borders, and the Maranhão and Itapicuru fall into the bays of San José and San Marcos a little W. of the central part of the coast. The coast E. from this point is unbroken by a single considerable indentation. The surface in most places is mountainous, and much of it is covered with dense forests, from which several valuable species of timber are procured. Rice, cotton, and sugar cane are the staples of cultivation.—**MARANHÃO**, or **SAN LUIZ DO MARANHÃO**, the capital of the preceding province, is situated on an island of the same name, in lat. $2^{\circ} 31' 42''$ S., long. $44^{\circ} 18' 42''$ W.; pop. 86,000. The island is 20 m. long, and is separated from the continent by a narrow channel called the Rio do Mosquito, while on either side of it are the bays of San José and San Marcos, the embouchures of the Maranhão and Itapicuru rivers. The town is built on a peninsula between two small inlets on the W. side of the island, and is shut in from the rear by steep hills. Its harbor is difficult of entrance, but otherwise good. The streets are crooked and ill paved, but the plan of the town is regular, the houses, built frequently of sandstone, are generally two or more stories high, and one section is adorned with numerous gardens. The public buildings comprise 10 or 12 churches and chapels, a Jesuit college, several convents, the bishop's palace, several hospitals,

the governor's residence, and the town hall. Maranhão is the entrepot for 6 provinces, and has an important trade with foreign countries, the imports comprising European manufactures, and the exports rice, cotton, rum, medicines, and a kind of butter made of tortoise eggs, and called *manteiga de tartaruga*.

MARAÑON. See **AMAZON**.

MARAT, JEAN PAUL, a French revolutionist, born of Protestant parents at Baudry, in the principality of Neuchâtel, in 1744, assassinated in Paris, July 18, 1793. Of his earlier years not much is known. He was educated as a physician, and became deeply learned in medical science; but the narrow sphere in which he lived offering scanty means to satisfy his ambition, he went abroad. At 30 years of age we find him at Edinburgh, where he obtained a living as private tutor. At that time he published a revolutionary pamphlet in the English language, entitled "The Chains of Slavery," which appeared in French at Paris in 1792. In the following year, by a more voluminous publication (*De l'homme, ou des principes et des lois de l'influence de l'âme sur le corps et du corps sur l'âme*, 8 vols., Amsterdam, 1775), he entered the arena as an opponent of Voltaire, who accepted the challenge, and a literary controversy ensued between them. In a series of writings, brilliant with paradoxical assertions plausibly maintained, Marat attempted to revolutionize natural philosophy, and to refute the Newtonian theory. His success being far inferior to his pretensions, he relinquished the field of literature and went to Paris, and settled there as a physician. The violence of his character and his obstinate adherence to his peculiar notions prevented his obtaining a practice sufficient for his wants; and after many disappointments he was obliged to accept a position as veterinary surgeon to the count of Artois, afterward Charles X. At last the outbreak of the revolution gave him the long desired opportunity of letting loose his wild schemes upon society. From the very commencement of the popular movement he played the part of the most restless demagogue. Although physically he was not prepossessing, being only five feet high, with a strange mixture of the ludicrous and terrible in his countenance, he soon obtained a vast influence over the lower classes by his energy and resolution. On Sept. 12, 1789, he published the first number of the *Publiciste Parisien*, whose title was afterward changed into *Ami du peuple*. Never has human language been used for the expression of wilder passions, of more reckless fanaticism, of a more savage thirst for revenge, than in this publication. As early as Aug. 1789, Marat had publicly proclaimed that 800 members of the national assembly ought to be hanged, Mirabeau the foremost among them. In the same spirit every page of the *Ami du peuple* was written. Having been introduced by Danton into the club of the Cordeliers, he created there disturbances so violent that the municipality ordered his arrest in Jan. 1790. He

evaded it by secreting himself in the cellars of the Cordeliers, whence he continued to issue his periodical. After the king's unsuccessful attempt at flight, Marat again ventured into publicity, and directed his attacks against the Girondist party of the legislative assembly. Having been prosecuted in consequence, he returned to his former underground haunts, from which he again emerged in Aug. 1792. He now became the right hand man of Danton, at that time minister of justice, introduced himself into the vigilance committee established by the municipality of Paris, and was one of the chief instigators of the horrible massacres of Sept. 1792. To reward him for the part he had taken in these atrocities, the people of Paris sent him to represent them in the national convention. The speeches he made there were like his writings, and were received by the party which at that time constituted the majority with a feeling of abhorrence mingled with contempt. They moved a vote of censure against him for having advocated the establishment of a dictatorial power. When, after angry discussions, the motion was at last withdrawn, Marat produced a pistol from his pocket, exclaiming that, if the motion had passed, he would have blown his brains out in the presence of the convention. Emboldened by impunity, he grew more fanatical every day, and in his paper (the title of which had been again changed on Sept. 21, 1792, into *Journal de la république Française*) openly asked for the heads of 270,000 "traitors," and the massacre of three fourths of the members of the convention. In vain the Girondists endeavored to break down his influence. Under the pressure of popular excitement, created by foreign intervention, the ultra-revolutionary party had gradually obtained the ascendancy, and the most sanguinary proceedings being considered unavoidable in order to prevent a co-operation of the anti-revolutionary elements with the foreign foe, Marat, who excelled all others in this respect, was almost adored by the Parisians as the saviour of the country. Thus, in April, 1793, he succeeded in obtaining the passage of a "law for the arrest of suspicious persons," by the operation of which no fewer than 400,000 individuals were imprisoned throughout France. Having, as chairman of the Jacobin club, signed an address to the people in which the assassination of the Girondists was openly called for, he was prosecuted before the revolutionary tribunal. But his trial became a triumph. The public prosecutor, the jurors, and the audience did him homage as if he were a supernatural being, and he was carried in triumph to the national convention, where Danton delivered an eloquent eulogy in his honor. He now rapidly rose to the culminating point of his career. Having made the municipality subservient to his plans, he instigated the mob of May 31, 1793, by which the Girondist party was completely destroyed. With Robespierre and Danton he formed a sort of triumvirate, which, by legal or illegal means, deter-

mined the destinies of France. Marat, however, played more the part of an electrical chain, by which the rulers remained in direct communion with the instincts of the masses, than of a leading spirit. Confined by disease in his garret, he remained restlessly active in stirring up, by letters and denunciations, the passions of the people and of the national convention, though Robespierre and Danton paid little attention to him. He was finally assassinated by Charlotte Corday, while preparing a list of Girondists to be sacrificed to the common weal, only a few days before his life would probably have ended by natural causes. Robespierre used his death as a pretext for carrying the reign of terror to its utmost extent. Hundreds of victims were sacrificed to the "manes of the martyr." The entire national convention attended his funeral. His body was transferred, Nov. 4, 1793, to the Pantheon, and his portrait, executed by the celebrated David, adorned the hall of the convention. A pension for life was voted by the "grateful nation" to his concubine. Two years later, when the revolutionary passions had cooled down, the remains of Marat were removed from their resting place and his portrait taken down. Though vain and egotistic, Marat was perfectly sincere in his sanguinary ravings, and so disinterested that, even in the height of his power, he lived in the most abject poverty.

MARATHON, a N. co. of Wis., bordering on Mich., and drained by the Wisconsin river and its branches; area, 6,048 sq. m.; pop. in 1855, 1,427. It has a diversified surface, extensive pine forests, and numerous small lakes. Capital, Wausan.

MARATHON, a town of Attica, in the demus of the same name, near the eastern coast, celebrated by the victory of the Athenians under Miltiades over the army of Darius (490 B. C.). (See GREKOR, vol. viii. p. 441.)

MARATTI, CARLO, an Italian painter, born in Camarano in 1625, died in Rome in 1718. At about the age of 12 he was sent to Rome and put under the instruction of the painter Andrea Sacchi, with whom he remained 8 years. He became a student of the works of Raphael, and his contemporaries, supposing that he could only paint madonnas, called him *Carluccio delle Madonne*; but he silenced their sneers by executing for the baptistery of St. John Lateran a picture of Constantine destroying the idols, which caused him to rank among the first painters of the day. His works are numerous in the churches and palaces of Rome. He also restored the frescoes of Raphael in the Vatican, and those of Annibale Carracci in the Farnese palace. His masterpiece is said to be the "Martyrdom of St. Biagio" at Genoa.

MARBLE, a rock used as an ornamental building stone, for interior decorations and for sculpture. Generally, any limestone that can be obtained in large sound blocks, and is susceptible of a good polish, is marble; and the only marble that is not limestone is the serpentine and the verd antique (the latter a mixture of

serpentine and limestone). It is found in beds in various geological formations. In the azoic group it is a metamorphic rock of granular and crystalline structure, and often presents a fineness of texture and purity of shading that fit it for the choicest works of the sculptor. In the palæozoic formations it bears more of the character of a sedimentary rock, and it is apt to contain organic vestiges, as corallines and fossil shells, which indeed sometimes compose nearly its whole substance; it is also of variegated colors, and sometimes is of brecciated structure, evidently made up of fragments of an older rock, the layers of which, broken up and confusedly rearranged, have been cemented together. Though thus varying greatly in color, texture, and structure, the composition of marble is for the most part essentially the same; it is a carbonate of lime, or a combined carbonate of lime and carbonate of magnesia, and is readily burned to quicklime. It is soft and easy to work with the chisel or hammer, generally of even grain, so as to be split with wedges, and of specific gravity about 2.7, making the weight of a cubic foot about 169 lbs. Its durability is very variable, some varieties retaining sharp edges when exposed for many years to the weather, and others, especially the dolomites, soon crumbling away. (See *Dolomite*.)—Many varieties of marble have acquired a name and celebrity from remote times. The ease with which the rock is worked caused it to be selected for the earliest structures. Wilkinson states that "the most ancient buildings in Egypt were constructed of limestone, hewn from the mountains bordering the valley of the Nile to the E. and W., extensive quarries of which may be seen at El Masara . . . and other places; and that it was used long before sandstone is proved by the tombs of the pyramids as well as those monuments themselves, and by the vestiges of old substructions and ruins in Upper Egypt. Limestone continued to be occasionally employed for building even after the accession of the 12th dynasty." The more durable nature of the sandstone then discovered, and the greater ease with which it was quarried and worked, caused this rock to be substituted for the limestone or marble. The names of many marbles famous among the ancient Greeks and Romans are still retained, and their localities are known. Mt. Pentelicus in Attica furnished the valuable Pentelican white marble, called by the moderns Penteli marble; the islands of Paros and Naxos near Attica, the still celebrated Parian marble; and other similar white marbles came from Mt. Hymettus in Attica, and from Thasos and Lesbos, from Corallo in Phrygia, Cyzicus on the Propontis, and one variety, exceeding the Parian in whiteness, from Luna in Etruria. Of the first named (the Pentelican) the Parthenon was built, and also the temple of Ceres at Eleusis, beside many celebrated statues. Though of finer grain than the Parian, it is said not to retain its polish and beauty so well. The Parian marble is placed first by both Theophrastus and Pliny in their enumeration of ancient mar-

bles. Pindar and Theocritus also celebrated its praise. Its whiteness was regarded as peculiarly pleasing to the gods, and it was chosen for the works of Praxiteles and other eminent sculptors. The statues of Venus de' Medici, Diana Venatrix, the Oxford marbles known as the Parian chronicle, and many other famous works, are of this marble. Black marbles are occasionally referred to by the ancients; but some of those named, as the *Chium marmor* from the island of Chios, appear to be of questionable character. This one is sometimes called *lapis obsidianus antiquorum*. It was glossy black, and received so high a polish that it was made into mirrors. There was also a black obsidian obtained from Ethiopia. The name, however, may have been applied to real marbles, being possibly a corruption from *opsianus* (*οψιανος*, *απο της οψης*), having reference to any peculiar appearance. The green marbles were serpentines from various localities. Yellow marble was obtained at Corinth. The *marmor Phengites* was white with yellow spots; the Rhodian was marked with spots of a golden color, and that of Melos yellow.—The marbles of modern times have been variously classified and named. In southern Europe two general divisions are made of antique and modern. The quarries of the former being lost or abandoned, the stone is obtained only from ancient monuments; and being consequently most highly prized, methods are resorted to, and sometimes with success, to attach the name antique to stone from quarries now worked. It is also the case that some of the marbles held in the highest estimation in France, being transported from monuments at Rome, are the products of quarries worked in ancient times in France. It is probable these might be again discovered. Without reference to these marbles, however, the French boast that their country surpasses even Italy in the beauty and variety of this class of stones. The following are convenient divisions in which marbles may be arranged for a general notice of the most important of them: 1, the simple or single-colored marbles; 2, the variegated; 3, the brecciated; 4, the lumachella or fossiliferous. These sorts, however, pass into each other, so that some may be placed indifferently either in one or the other of two groups. 1. The best known of the first class are the plain white marbles, some of which have been already named. The white marble of Carrara, of which an account is given in the article *CARRARA MARBLE*, is of a texture like loaf sugar, differing in this respect from the Parian marble, which on close examination appears to be made up of the most delicate plates or scales, confusedly but most closely united together. Pure black marble is found in some ancient Roman sculptures. Some varieties of it are obtained in Derbyshire, England, and in Kilkenny, Ireland; but as the latter is more or less intermixed with fossil shells, it should come under the 4th division. It is quarried in the United States at Shoreham, Vt., and Glen's Falls, N. Y., and specimens are

obtained from some other localities. The colored marbles are generally variegated; but the Sienna marble of Italy is sometimes of a uniform yellow color, or the same clouded. Some of the red marbles of Italy also display only the one color. In North America white marbles are worked at various places on the range of the great belt of metamorphic rocks through Canada, Vermont, western Massachusetts, a little back of the cities of New York, Philadelphia, Baltimore, and Washington, and thence through Virginia and the Carolinas into northern Georgia and Alabama. It is this formation that supplies the white marble for building purposes to the different cities along its range, and its quarries in Massachusetts and New York furnish the marble for the most costly edifices of southern cities. The statuary marble is only the finest grained variety of this common building stone. Many localities are known to furnish it in small beds interstratified with the coarser marble. In Vermont only have they been opened of sufficient thickness to justify working them. The quarries of Rutland furnish marble of exceedingly delicate texture and purity of whiteness, and the blocks are large and sound, and quite as beautiful as the statuary marble of Carrara. The objections to it are that it is harder and more brittle than the foreign; these defects will probably diminish as the stone is obtained from beneath deeper cover. 2. The variegated marbles are those variously spotted, shaded, and veined. They are the most numerous class, and include the most beautiful of the colored marbles. None are more highly esteemed than the variegated yellow marble of Sienna. This and the Italian dark red marbles may be seen in many of the costly mantels in our marble shops; and also the soft, shaded, dove-colored Lisbon marble, of which are made the smaller columns in the entrance of the Unitarian church at the corner of 4th avenue and 20th street, New York. The black Genoese marble, with golden-colored and white veins, called Portoro marble, the best of which is from Porto Venese, has for many years past been the most popular and the best known foreign marble in all parts of the United States, though now rather out of fashion. It is a weak stone, and is for the most part used in thin slabs cemented upon a back of slate. The marbles of this class found in the United States east of the Rocky mountains have not attained much celebrity, nor do we know of any worthy of it, unless we should include among them certain varieties of the brecciated marbles from northern Vermont and Tennessee. The gray and white clouded limestones of Thomaston, Me., are quarried to considerable extent for marble, and may be seen in common use in portions of the eastern states. They possess little beauty. California has furnished of this class some very showy marble of brilliant reddish and brownish colors, and susceptible of a high polish. It is imported into New York and used for mantles. 3. The brecciated marbles are composed of angular fragments, it may be of various mineral substances, united in

a bed or paste of calcareous cement; or the mass may be so divided by numerous veins into pieces as to present the appearance of broken fragments irregularly united. Brocatellas are breccias, in which the fragments are very small; we incorrectly apply the name only to a reddish brecciated marble brought to this country from Spain. The varieties of this class are very numerous; but some of the most celebrated are never seen here—such for instance as those called *le grand deuil* and *le petit deuil*, literally the full mourning and the half mourning. These come from the Pyrénées and different parts of France; they are of a black ground spotted with white fragments. Among the brecciated marbles of the United States, the best known is that of the Potomac on the Maryland side, some miles below the Point of Rocks. The principal use that has been made of it was to furnish the columns in the old chamber of representatives at Washington. The irregularities of hardness in the different ingredients render it an expensive stone to work; still the quarries are deserving of more than government patronage. The stone is certainly handsomer than the Italian red and white breccia imported for the inner columns of the central arched entrance of the church in 4th avenue. Quarries have been recently opened in the northern part of Vermont, near Lake Champlain, which produce the most beautiful of the American colored marbles. They are brecciated, though they pass into the variegated. They present a great variety of colors, from a deep red, traversed with veins of white, to rose-tinted flesh color mottled with whitish spots. In some specimens the brecciated structure is very strongly marked, the fragments being large with sharp edges and of decided shades of dark red, drab, and salmon, upon a ground of white bordered with rose. Unlike the Potomac marble, the fragments are not different varieties of rock, but are all limestone. The stone, though somewhat hard for marble, is still of uniform texture and takes an even high polish. Some large blocks closely resemble the foreign brocatella. A small quantity of this stone has been purchased for the interior of the U. S. capitol. It is however very difficult to work. Other marbles of this character and of rather dark red colors abound near Knoxville, Tenn., and have recently been brought into notice by the extent to which they are employed in the construction of the new capitol at Washington. 4. Luma-chella or fossiliferous marbles are those which contain petrified shells. These are sometimes so crowded upon one another, that they compose the whole mass of the stone; sometimes single shells are seen scattered throughout the block. A dark marble from Kilkenny, in common use for mantles and hearths, often presents a section on its polished face of the nautilus shell. The white spiral lines of the shell on the dark ground have exactly the appearance as if a rough-nailed heel had been carelessly spun around upon the surface; and many a nice housewife, but unskilled in palæontology, has tried in vain to rub

out the vexatious spot. These marbles are very abundant in Europe, and also throughout New York and the western states. Handsome mantles are made of American varieties which are composed entirely of fossil shells, but they are rather to be regarded as curious than beautiful. They lack the high colors of the brecciated and variegated marbles, and though they take a good polish, they are from their plain colors comparatively dull and sombre. Some of the best of the kind is from Becraft's mountain, back of Hudson, N. Y., which is thus noticed by Prof. Silliman ("American Journal of Science," vol. vi. p. 871): "The marble is of a grayish color with a slight blush of red; its structure is semi-crystalline, and in some places highly crystalline, especially in and around the organized bodies which in vast numbers it embraces. The large slabs present a great diversity of appearance, and can scarcely be distinguished from the similar transition marble of the Peak of Derbyshire, which it quite equals in beauty and firmness." In Hudson it has been used in many of the houses for ornamental work, and it has been introduced into New York.—Serpentine, as before stated, differs in composition from the other marbles. It consists of about equal parts of silica and magnesia with 12 per cent. of water. It is a soft mineral of different shades of green, of waxy lustre, and susceptible of a high polish. It is better adapted to ornamental work within doors than to be exposed to the action of the weather. Verd antique is a mixture of green serpentine and light-colored limestone. These varieties come from Genoa and Tuscany, and the best verd antique from Egypt. Some fine specimens from Italy are to be seen in the outer columns at the central entrance of the church already referred to; but they are in no respect superior to what might have been furnished from many of our own localities—from one not even 70 miles distant from New York. A quarry of serpentine and verd antique was worked more than 40 years ago at Milford, Conn., $1\frac{1}{2}$ m. from the present station on the New Haven railroad. Slabs of it were used in the adjoining town of New Haven for fireplaces, some of which are still to be seen. Some are also preserved in the mineralogical collection of Yale college, and other slabs in New York city. These are quite as fine and beautiful as the verd antique columns alluded to, and their size and soundness are such as fully to justify the expectation that the quarry, if properly reopened and worked, would afford good blocks of any required size. The locality has been highly recommended by Professors Silliman, Charles Upham Shepard, and Renwick. Brongniart, the celebrated mineralogist, in a letter to Prof. Silliman, quoted by him in the "Journal of Science," vol. ii. p. 165, speaks of a polished specimen he received as "one of the ornaments of my cabinet, and is referred with great precision to my *ophtalmo veinée*" (verd antique marble). The blocks that have lain about the surface for 80 or 40 years

have assumed a hardness that might discourage one ignorant of the fact that freshly quarried stone from under deep cover is always much softer to work; and so one familiar with the proper mode of quarrying would see that by heavy deep blasts, and then by judicious splitting with wedges, the former great waste of throwing a rock without grain like this by small charges of powder into fragments may be avoided. We cannot believe that a quarry furnishing such beautiful marble as this, so convenient to transportation, should much longer be suffered to lie neglected, when we find stone no better imported from the Mediterranean. In Vermont and Canada serpentine abounds; and verd antique may be obtained in various places in New York and Pennsylvania, and in any of the New England states. Quarries of serpentine have been recently opened at Roxbury, Vt., and the stone is already favorably introduced into Boston, a block of it having been selected for the pedestal of the statue of Franklin. A quantity of this stone was purchased for the capitol at Washington, but it was found to be too brittle for any tool but the saw. Its use was therefore abandoned, and the stone has been sawed into tiles for the flooring of the treasury extension. This variety is described by Dr. Hayes, who has subjected it to a chemical examination, as a peculiar mixture of various magnesian minerals, as talc, asbestos, and chlorite, with fragments of slate, cemented together by a white paste composed of anhydrous carbonate of magnesia. It has been supposed to be verd antique; but finding that it contains no carbonate of lime, he proposes for it the name of serpentine marble. For durability he considers that it should be classed with the granites, the most durable of all building stones. In this quality its composition indicates that it must be superior to the ordinary serpentines, the above named minerals being remarkable for their resistance to the ordinary causes of change of appearance. Serpentines, as seen at the quarries, are liable to change upon the surface to a reddish brown by the peroxidation of the salts of iron they contain; it is probably for this reason that they are not more used in situations exposed to the weather. A want of grain prevents the stone from being split into blocks; but when freshly quarried it may be sawed almost as easily as marble. It is highly recommended for building purposes in the excellent treatise called the "Model Architect," by S. Sloan of Philadelphia, as follows: "There is one material, which we wish we could dwell on at length—the serpentine rock, such as is found in Chester co., Penn. Nothing can be better for a certain class of cottages, its greenish hue giving it a rural expression of the most pleasing kind. The walls already built of it promise to last well, and we would recommend it wherever it can be obtained as a most excellent material, and more easily worked than any other, since it is soft when first quarried and hardens on exposure."—The divisions we have named of the ornamental marbles are consider-

ably multiplied and subdivided by the French and Italians; but they are quite sufficient for the very limited number of varieties we have as yet occasion to be familiar with in this country. As new regions are opened, new localities will be discovered, and many already known will be made accessible by new railroads. In time, doubtless, many varieties of our own marble from quarries yet unknown will acquire as high a popularity as that of many now brought to us across the Atlantic.—Marble is largely employed in the United States for public buildings and the fronts of stores in the cities. Among the most important structures of it are the capitol at Washington, Girard college in Philadelphia, the custom house at Charleston, S. C., that at New York, and the city hall of New York. The fine pillars of Girard college are formed chiefly of stone from Berkshire, Mass., and the other parts of the building are of marble from quarries near Philadelphia. The custom house at Charleston was built of stone from Massachusetts and from a quarry at Hastings on the Hudson. Every block was fitted at the quarry for the place it was to occupy in the building, and was marked with a number corresponding to one on the plan. The New York custom house is of marble from Tuckahoe in Eastchester, near the Harlem railroad. The quarry there affords stone in very large blocks, and its composition is nearly that of a pure carbonate of lime, while most of the other white marbles are dolomites. The marble of Sing Sing is a true dolomite, and of a variety disposed to disintegrate and rapidly crumble away. The New York city hall is of Massachusetts marble. In the selection of the marble for the extension of the U. S. capitol careful experiments were made by the commission appointed for this purpose in testing the qualities of the different kinds offered. The results were reported in full to congress, and some facts of general interest were presented by Professor Joseph Henry in a paper read before the American association for the advancement of science, and published in the annual report of the Smithsonian institution for the year 1856. To determine the comparative durability of marbles no tests are so satisfactory as actual use; and in this country the time that any of them have been employed is too short to be of much service in this respect. The natural causes of change can be but imperfectly imitated by artificial methods. One of the most destructive agents is the change of temperature by freezing and thawing; yet the effect of this is perceived in good marble only after a long series of years. Specimens of the marbles were submitted to the influence of freezing mixtures, in some instances as many as 50 times, and usually for 24 hours at a time. The effect of this upon the best varieties was to cause an exfoliation calculated from the loss of weight to amount to nearly the $\frac{1}{1000}$ part of an inch. From this cause alone, therefore, supposing the alternate freezing and thaws amounted to 50 times every

year, the surface of the marble would be exfoliated to the depth of an inch in 10,000 years. In testing the strength of the marbles, or their capacity to resist pressure, the same apparatus was employed that was devised by Major Wade for testing the strength of gun metals. The specimens were made into cubes of $1\frac{1}{2}$ inch face, and the action of the machine was upon the two surfaces which were parallel to the natural bed of the stone. In applying the pressure the remarkable fact was discovered, that when, as commonly practised in testing the strength of stones, a thin plate of lead was interposed between the stone above and below and the steel plate which pressed against it, the stone gave way with about one half the pressure required to produce the same effect when no lead was present and the steel plates bore directly upon the surfaces, which by a machine specially constructed for this purpose had been ground into perfect parallelism. With the plates in contact with the stone, this withstood in one instance a pressure of more than 60,000 lbs., while with the lead a precisely similar stone gave way with about 30,000 lbs. pressure. The same results were obtained without exception in a great number of trials of pairs of different marbles; and they show that the crushing force required is much greater than that heretofore given for the same material. The specific gravity and the quantity of water absorbed by each marble were also determined. The marble selected is a fine-grained dolomite from a quarry in the S. E. part of Lee, Mass., for the most part white with occasional blue veins, of specific gravity 2.862, weighing per cubic foot 178.87 lbs. It absorbs .108 oz. of water per cubic inch, and its porosity is great in proportion to its power of resistance to pressure. It sustains 28,917 lbs. to the square inch. Its composition was found by Dr. John Torrey to be as follows in 100 parts: carbonate of lime, 54.621; carbonate of magnesia, 43.982; carbonate of protoxide of iron, .365; carbonate of protoxide of manganese, a trace; mica, .472; water and loss, .610. The mica is in small colorless crystals, visible only under the microscope. When this marble was placed in the walls, a remarkable brownish discoloration soon appeared, the cause of which after some time was traced to the evaporation of the water absorbed from the mortar and otherwise through its pores, and the deposition of the impurities brought along by the water. The remedy applied with success was to coat the surfaces laid in mortar with asphaltum.—The processes of preparing marble for use differ from the working of granite. This hard rock, after being quarried, is split by small wedges driven into holes drilled in a line, and is then dressed by hammers or used in the rough. Marble, being a comparatively soft rock, is cut into slabs by a process of sawing with smooth iron saws fed with sharp sand and water. Several of these plates or saws are set in one frame, and in a large establishment 20 or more of the frames may be seen kept in

steady operation by a steam engine. The progress of the saws cutting down through the great blocks of marble seems very slow, for the most part not exceeding an inch per hour. The thickness of the slabs is usually 4 or 6 inches. In this form the marble is used for facing the walls of buildings upon a back of brick, giving all the effect of a solid wall of marble at much reduced cost. Freestone fronts are put up with the same regard to economy. In the most expensive structures only are the walls built of solid blocks of marble or freestone. Marble slabs for mantles and other interior work are sawed like those for building, and are then rubbed smooth upon a heavy revolving table of cast iron, called the rubbing bed, and afterward polished. This business is extensively carried on in the numerous marble shops in the cities. It affords employment to various classes of artisans; and the designing of the more elaborate patterns and the carving of the stone often call for a high order of talent in these departments.—The imports of marble into the United States in the year ending June 30, 1859, chiefly from Italy, amounted to about \$172,000; manufactured marble was imported to the extent of about \$28,000. The exports of American manufactures of marble and stone, mainly to Canada, Cuba, and Australia, were valued at \$112,000.—In No. 392 of the "Journal of the Society of Arts" (May 25, 1860) is an elaborate paper by W. P. Jervis, F.G.S., descriptive of the various marbles of Carrara and its vicinity, entitled "On the History, Geological and Geographical Distribution, and Commercial Bearings of the Marbles of Tuscany and Modena, and of the Boracic Acid Lagoons of the Maremma." To this paper, and to the remarks made upon its reading before the society by different members, the reader is referred for a large stock of information upon the great number of varieties of marble of this famous district, and the vast extent of its quarries. Upon the topographical map of the district, which accompanies the paper, are represented no fewer than 88 localities of quarries, all of which furnish varieties of marble more or less peculiar. The quantities appear to be sufficient for the supply of the world; but unfortunately, by reason of the government restrictions and imposts, and the ill-directed enterprise of the proprietors, the capacity of the quarries, though worked for centuries, is little developed; and the expense of getting the stone to the coast of the Mediterranean, only a few miles distant, over miserable ox tracks in "antediluvian ox wagons," and then of placing it on shipboard, is so great as to limit the trade to a very small proportion of the extent it would reach under a more judicious system of operations. The exports of marble from Carrara from 1837 to 1846 were valued at £370,341; and the total produce of 1847 was estimated as worth £66,189, during which time the trade gave employment to 2,258 persons. The following table, prepared by Sig. Fabbriotti, is given as presenting a near ap-

proximation of the present extent of the business:

"Of the marble in blocks, about half is exported to the United States, which appears to be a steady and good market. Of the other half, one third is exported to Great Britain, and two thirds to the rest of Europe. A heavy duty is levied on Italian marbles in France, in order to keep up the demand for home produce. Notwithstanding these disadvantages, Carrara marble is much used there. The weight of Carrara is about 160 lbs. per cubic foot. That of Sienna marble is about 180 lbs.; it is sold by weight. The price of labor at Carrara is about 2s. per diem for common laborers; 2s. 6d. to 3s. for skilled quarrymen; 4s. for the best and most intelligent workmen. No vessels can load at the beach below Carrara, Massa, or Serravezza, direct for this country, as the depth of water is so inconsiderable, though coasters go as far as Naples, Marseilles, Genoa, and Leghorn." The foreign shipments are made from Leghorn. Those to Great Britain in 1859 consisted of sawn or otherwise manufactured marble 593 tons 12 cwt., worth £29,678, and of rough blocks or slabs 89,740 solid feet, worth £49,858. The London prices per cubic foot, which fluctuate considerably, are given as follows:

The cathedral of Milan, one of the most wonderful marble structures in the world, in respect not only of size, but also for the elaborate finish and delicacy of its architecture, and for its dazzling brilliancy when illuminated by the sun, is commonly supposed to have been built of Carrara marble; but it is only the 4,000 statues which stand on brackets or crown the pinnacles that are of this stone. The cathedral itself is built of marble from quarries given to the church by the first duke of Milan, Giovanni Galeazzo Visconti, and situated in Monte Candoglio or Candido, on the Toce, a tributary of Lago Maggiore. Although the foundation was laid in 1386, the durability of the stone cannot now be fairly judged of, as the exterior has just undergone an entire repair, the decayed parts being carefully removed.—The Tuscan quarries of Serravezza, including Stazzema and the Altissimo, produce about 258,158 cubic feet of marble annually, in blocks and slabs, valued at £195,000, and also squared paving flags to

the amount of about £190,000 more. The following are the prices of Tuscan marbles at Serravezza per cubic foot:

—**MARBLE, PLAYING**, a little ball of marble, baked clay, agate, or other stony substance, used as a toy for children. Marbles are made in immense quantities in Saxony for exportation to the United States, and to India and China. They are also largely manufactured in the agate mills at Oberstein on the Nahe, in Germany, particularly for the American market. The material used in Saxony is a hard calcareous stone, which is first broken up into square blocks with a hammer. These are then thrown 100 to 150 together into a mill, which is constructed of a stationary flat slab of stone, with a number of concentric furrows upon its face. Over this a block of oak of the same diameter, partially resting upon the small stones, is kept revolving, while water flows upon the stone slab. In 15 minutes the marbles are worn completely round, and are fit for sale. An establishment with 8 mills will manufacture 60,000 marbles in a week. Agates are made into marbles at Oberstein by first chipping the pieces nearly round with a hammer, and then wearing them down upon the face of large grindstones. The hard stones are managed with great dexterity by the workmen, who in a few minutes bring them into the shape of perfect spheres.

MARBLEHEAD, a town of Essex co., Mass., 4 m. E. from Salem, and 16 m. N. E. from Boston, with which city it is connected by a railroad; pop. in 1855, 6,167. It is built upon a peninsula projecting into Massachusetts bay, about 4 m. in length and 2 in breadth, with an area of about 8,700 acres. The surface is elevated, and is exceedingly irregular and rocky. The harbor is deep and convenient, and is about 1½ m. long by ¼ m. wide. The town has been noted from the first settlement of New England for the enterprise of its people in the fisheries. Of late years, however, this branch of business has been comparatively neglected, and the inhabitants have engaged in the manufacture of boots and shoes, which were made in 1855 to the value of \$1,020,373. There were also produced glue to the value of \$20,000; boxes, \$15,000; ship's bread, \$35,850; oakum, \$17,600; machines, \$10,000; and a considerable amount of cordage, sails, &c. Marblehead was originally a part of Salem, and was incorporated as a distinct town in 1649, at which time it contained 44 families. Many of the settlers were from the Channel islands, Guernsey, Jersey, &c.; and their peculiarities of language are still to be noticed among the inhabitants, and formerly existed to such a degree as almost to constitute a peculiar dialect. At the commencement of the revolutionary war

Marblehead was reckoned the second town in Massachusetts in population and wealth. It contributed a regiment of 1,000 men to the revolutionary army, and at the end of the war there were 600 widows and 1,000 fatherless children in its population of less than 4,000. During the war of 1812 the frigate *Constitution* was chiefly manned by men from Marblehead, and the town also sent out a great number of privateers; and when peace was declared it was found that 500 citizens of the place were held in England as prisoners of war.

MARBURG, a German town, capital of the province of Upper Hesse in Hesse-Cassel, situated on the river Lahn, 60 m. by railway N. by E. from Frankfort-on-the-Main, and 65 m. S. W. from Cassel; pop. about 9,000. The principal public buildings are the church of St. Elizabeth and the ancient castle of the landgraves of Hesse on the Schlossberg (now used as a penitentiary), where the famous religious conference between Luther and Zwingli took place, Oct. 1-3, 1529. The university of Marburg was the first founded in Germany after the reformation, by the landgrave Philip the Generous (May 30, 1527); it was richly endowed from the proceeds of the confiscated property of the clergy, and attracted students from all parts of Protestant Europe. Although a rival university was established in Giessen in 1607, it continued to flourish until the outbreak of the 30 years' war. From 1625 to 1650 the Giessen university was united with that of Marburg, but they have since been again separated, the former being now the national university of Hesse-Darmstadt, and the latter that of Hesse-Cassel. In the first part of the 18th century Marburg derived great celebrity from the philosopher Christian von Wolf, who officiated as one of the professors. The university is still annually attended by about 300 students; the number of professors is 40, and that of private teachers about 12. It contains a library of 112,000 volumes, an anatomical theatre, an observatory, an admirable chemical laboratory, a botanic garden, a lying-in asylum, a clinique, a school for veterinary surgeons, a zoological museum, a philological seminary, and one for political sciences. Marburg possesses also a gymnasium with 200 pupils, and other educational institutions; a society for natural history, and a Bible society. The town was several times besieged during the 7 years' war. In 1806 and 1809 it was the scene of the rising of the Hessian peasantry against the French, who destroyed in 1810 and 1811 the greatest part of the fortifications of the castle.

MARCELLUS, **MARCUS CLAUDIUS**, a Roman general, born about 267 B.C., killed near Venusia in 208 B.C. The family to which he belonged (a plebeian branch of the great Claudian gens) was of the highest distinction in Rome, and of aristocratic politics. Marcellus was early known as a bold and skilful soldier, serving in

the first Punic war. His first office was that of curule ædile, to which he was chosen about 226. Shortly afterward he was elected augur, and in 222 he was made consul. While holding that office he brought the Gallic war to a successful termination, killing the leader of the Gauls with his own hands, for which he was allowed a triumph, though the friends of his colleague Scipio claimed that he was entitled to a great part of the honor. Marcellus dedicated the spoils of the Gallic chief as *spolia opima* in the temple of Jupiter Feretrina, being the third and last instance of such dedication in Roman history. He was one of the prætors in 216, when the second Punic war was at its height, and was about to sail for Sicily, when the defeat of the Romans at Cannæ caused a change in his destination. Employed against Hannibal, he prevented the town of Nola from falling into his hands, and repulsed his forces, which was the first check received by the Carthaginian. He was summoned to Rome, to take part in the consultations concerning the conduct of the war, and then sent back to Campania as proconsul. Elected consul in 215, he resigned the office rather than offend the senate, which was averse to the whole consular power being in plebeian hands, his colleague being of the *plebs*. Returning to his proconsular position in Campania, he again baffled Hannibal at Nola, and inflicted great loss on his army. He was elected consul in 214, having Fabius Maximus for his colleague, and resumed his Campanian command, defeating Hannibal at Nola for the third time. Casilinum having surrendered to Fabius, on terms, Marcellus massacred all the garrison but 50. He was then sent to Sicily, which he nearly conquered in three years. The siege of Syracuse, which he maintained with true Roman pertinacity for two years, and which was opposed by the science of Archimedes, who was killed during the sack of the town, was one of the most famous sieges of ancient warfare. Returning to Rome in 211, he was refused the honors of a triumph because he had not entirely subdued Sicily. His ovation was very brilliant, but the magnificence of his Sicilian spoils, comprising rich works of art, gave much offence to the old Roman party. He was a 4th time consul in 210. Prevented from returning to Sicily by the opposition of the Sicilians, whom his cruelty and rapacity had alienated, he was placed at the head of the army that acted against Hannibal that year, and the next year retained the command of it as proconsul. During these two years he was, according to the accounts of his countrymen, engaged in several battles with Hannibal, in which the honors of the field were not unequally divided; but not the slightest credit is due to these relations, and it is asserted by Polybius, the best authority, that he never defeated the Carthaginian. The Romans complained of his want of vigor during the latter part of his proconsulate, but he defended himself successfully, and was elected consul for the 5th time. Having appeased the Arretians, who

threatened revolt, he again assumed command of the army in presence of Hannibal, his colleague being with him. While reconnoitring the Carthaginian camp, he fell into an ambuscade, and was slain. Hannibal caused his body to be burned, and sent the ashes to his friends. The life of Marcellus has been written so eulogistically that it is difficult to ascertain the facts of his career; but enough of it is known to show that he was a brave and energetic soldier, and that he was as cruel and ferocious in dealing with his country's enemies as he was devoted to that country's cause.

MARCH, in military science, the walk or movement of soldiers in order from one place to another. It is usually of 8 degrees of quickness, viz.: ordinary time, in which about 75 steps are taken in a minute; a quicker time, in which about 108 steps are taken in a minute; and a still quicker time, called also wheeling time, at the rate of 300 feet in the same period.—A march is also a piece of military music intended to accompany and regulate the footsteps of soldiers. Marches are of very different movements, some being quick and others slow, and were originally adapted to inflatile and pulsatile instruments. They are now written for every kind of instrument, and are found in great variety in the works of modern composers; as the funeral marches of Handel, Beethoven, and Chopin, the peasants' march in Weber's *Freischütz*, the *Fest* or "Coronation" march in Meyerbeer's *Prophète*, &c.

MARCH (Lat. *Martius*, *Mars*), the 3d month in our present calendar, consisting of 31 days. It was the first month in the early Roman calendar, and it also marked the commencement of the year among some of the Latin Christian nations till the 18th century. The English legal year began March 25, until the change of style in 1752. There is an old English and Scottish proverb: "March borrows three days of April, and they are ill."

The first, it shall be wind and weet;
The next, it shall be snaw and sleet;
The third, it shall be sic a freeze,
Sall gar the birds stick to the trees.

It is disputed whether these "borrowing days" were the last three in March or the first three in April. Dr. Jamieson explains that when they were stormy March was said to borrow them from April, that he might extend his power so much longer.

MARCOMANNI (Germ., men of the marches or borders), an ancient German people of Suevic race. They appear to have originally dwelt in the regions of the Main and Neckar in S. W. Germany, whence they followed Ariovistus across the Rhine, on his invasion of Gaul, and afterward their own chief Marobodunus into the land of the Boii, which embraced parts of modern Bohemia and Bavaria. Having subdued that people, they established a powerful kingdom N. of the Danube, which soon became involved in

Wars with the Cherusci, and afterward with the Romans. Their longest and bloodiest war was that waged, in alliance with the Quadi, Hermanduri, Narisci, and other German tribes, against the emperor Marcus Aurelius. The latter having died (180) in Vindobona (Vienna) on his last expedition against them, his son and successor Commodus hastened to conclude by purchase a shameful peace with the barbarians. In the 8d and 4th centuries the Marcomanni made some new incursions into the Danubian provinces of the Romans, but during the following great migration of northern nations they finally disappeared from history.

MARCY, WILLIAM LEARNED, an American statesman, born in Southbridge, Mass., Dec. 12, 1786, died at Ballston Spa, N. Y., July 4, 1857. He was the son of a farmer, and received his earliest education in the schools of his native town and at Leicester academy, and was graduated with distinction at Brown university, Providence, R. I., in 1808. After leaving college he removed to Troy, N. Y., where he studied law and was admitted to practice. When the war with England broke out in 1812, he was a lieutenant in a military company belonging to Troy, and with the rest of the company volunteered his services to the government, was sent among the earliest in the field to the northern frontier, and was stationed at French Mills, now Fort Covington. On the night of Oct. 22, 1812, he was sent with a detachment under command of Major Young to capture a party of Canadian militia posted at St. Regis. Lieut. Marcy led the attack, broke open himself the door of the blockhouse occupied by the Canadians, and when they surrendered received their arms. These were the first prisoners taken by the Americans on land, and their flag the first standard captured in the war. Mr. Marcy remained in service till the close of hostilities. In 1816 he was appointed recorder of Troy, from which office he was removed for political reasons in 1818. He acted with the republicans, or democrats as they were afterward called, and had voted as a republican for Gov. Clinton, but, becoming dissatisfied with his administration, had openly opposed him, and was in consequence deprived of his office. He now became editor of the Troy "Budget," a daily newspaper, which he soon made a leading organ of the democratic party. In Jan. 1821, he was appointed by Gov. Yates adjutant-general of the state militia; and in Feb. 1828, he was elected by the legislature comptroller of the state, when he removed to Albany, as the duties of the office required his residence at the seat of government. In 1829 he was appointed one of the associate justices of the New York supreme court, which office he held till Jan. 31, 1831, when he was nominated by a democratic legislative caucus for U. S. senator, and elected the next day. He took his seat in the senate in Dec. 1831, and remained in that body about two years, during which time he was chairman

of the committee on the judiciary. He resigned his senatorship in season to enter upon his duties as governor of New York, Jan. 1, 1833, to which office he was elected in 1832 by a majority of 10,000 over Francis Granger. He was reelected in 1834 by a majority of 13,000 over William H. Seward. In 1836 he was chosen for a 3d term by a majority of 30,000 over Jesse Buel. In 1838 he was the democratic candidate for the 4th time, but was defeated, and Mr. Seward was elected governor. At the expiration of his term as governor he was appointed by President Van Buren one of the commissioners to decide upon the claims of the Mexican government under the convention of April, 1839, and performed the duties of this commission till 1842. When President Polk assumed the government in 1845 he appointed Mr. Marcy secretary of war, a post whose duties, always sufficiently arduous, were made peculiarly difficult and responsible by the breaking out of the war with Mexico in the spring of 1846. His position was rendered more embarrassing by the circumstance that the two generals, Taylor and Scott, to whom the conduct of operations in the field was necessarily intrusted, were of the opposite party in politics, and soon imbibed and manifested a distrust of the good faith of the secretary which led to very unpleasant personal controversies. As a member of President Polk's cabinet Mr. Marcy's diplomatic powers were exerted to advantage in the settlement of the Oregon boundary dispute with England, and his abilities as a statesman were called into requisition upon many other questions. He supported Gen. Cass in the presidential election of 1848, and on the inauguration of Gen. Taylor retired to private life for 4 years. In March, 1853, he was appointed by President Pierce secretary of state, and in the latter part of that year he greatly distinguished himself at home and abroad by his correspondence with the Austrian government on the subject of the release of Martin Koszta by Capt. Ingraham of the U. S. navy. (See **INGRAHAM**, **DUNCAN NATHANIEL**.) Beside his Koszta letter, his state papers on Central American affairs, on the enlistment question, on the Danish sound dues, and on many other topics of national interest, exhibited his remarkable ability as a writer, statesman, and diplomatist. He retired from office on the inauguration of Mr. Buchanan, March 4, 1857, and just 4 months later died suddenly while lying on his bed reading. His conduct of the state department during President Pierce's administration added to his fame, and he left a reputation among his countrymen of all parties as a statesman of the highest order of administrative and diplomatic abilities.

MARDIN, a town of Asiatic Turkey, in the pashalic of Diarbekir, 835 m. N. W. from Bagdad; pop. about 20,000. It is situated on a rocky eminence, over 2,000 feet above the level of the sea. Near it is a Jacobite monastery, said to have a large library, containing works in 12 different languages.

MAREMME (sing. *la Maremma*), tracts of marshy country in Tuscany, the Papal States, and some other parts of middle Italy, on the Mediterranean coasts, which are extremely unhealthy from midsummer to the middle of autumn. During this period it is dangerous and often fatal to spend even a single night in the Maremma; those who do so are almost surely attacked by fever. There is nothing apparent in the air either to sight or smell to account for this insalubrity; on the contrary, the atmosphere seems to be remarkably clear and pure. The malaria does not proceed from the water of the marshes, for it is equally virulent on dry elevations. It has been attributed to unhealthy exhalations of sulphur and alum in the soil, but nothing is known with certainty of the cause or nature of the evil. In ancient times the Campagna di Roma, which is now almost deserted from the presence of the malaria, was cultivated like a garden, and was the seat of a dense population. The city of Rome itself has been invaded by the mephitic air, and the malarious fever already prevails in some of the streets. There is reason to apprehend that if some remedy is not discovered a great part of middle Italy will become uninhabitable. Efforts have been made in Tuscany to remove the evil by planting trees, but these have only partially succeeded.

MARENGO, a W. co. of Ala., bounded W. by the Tombigbee river, which unites with the Black Warrior on the N. W.; area, 975 sq. m.; pop. in 1850, 27,881, of whom 20,698 were slaves. It has a nearly level surface; the soil is very fertile, and a tract known as the "Canebrake" is considered among the most productive cotton land in the South. The productions in 1850 were 1,242,460 bushels of Indian corn, 261,080 of sweet potatoes, 14,550 lbs. of rice, and 32,295 bales of cotton. There were 19 grist mills, 4 saw mills, 27 churches, and 876 pupils attending schools. Capital, Linden.

MARENGO, a Piedmontese village on the river Bormida near Alessandria, situated on an extensive plain of the same name, where a victory was gained by Bonaparte over the Austrians under Gen. Melas, June 14, 1800. Bonaparte, having crossed the Great St. Bernard in the latter part of May and overrun a large portion of Lombardy, left Stradella, his head-quarters, on the Po, on June 12, and on the 18th entered the plain of Marengo, with the twofold object of preventing Melas, who had concentrated his forces at Alessandria, from escaping him by a march southward to Genoa, and of giving him battle if he should advance to deliver it. Encountering no enemy, he detached Desaix, just arrived from Egypt, southward on the road to Novi, to intercept any retrograde movement of the Austrians, and posted the main body of his army in separate divisions, with considerable intervals between, in and about the village of Marengo, remaining with his reserve of 4,000 men at Torre de Garofalo, some miles distant. Meanwhile Melas having decided that the only

secure way of reaching Genoa was by giving battle to the French, crossed the Bormida at daybreak on the 14th with 81,000 men and 200 pieces of cannon, and about 8 o'clock furiously assaulted the village of Marengo, occupied by two French divisions under Victor. The latter, after maintaining an unequal contest for several hours, were driven in confusion from the village, and Lannes, who had defended his position on the right behind Marengo with success, was obliged to fall back with the fugitives. At 11 o'clock, when Bonaparte arrived upon the field, the greater part of the French army was in full retreat, Victor's beaten troops being with difficulty covered by Lannes's corps drawn up in squares *en echelon*, and by the cavalry under Kellermann and Champeaux. Orders were at once sent to recall Desaix's corps, the fugitives, reanimated by the presence of the commander-in-chief, rallied behind Lannes's squares, and the advance of the Austrians was temporarily checked. Melas, supposing the victory secure, returned about 2 o'clock to Alessandria, with a considerable body of cavalry detached to watch a French division in the rear under Suchet, leaving Gen. Zach to continue the pursuit. For several hours the French with difficulty held their ground, and were beginning again to waver before the enemy, whose cavalry, greatly outnumbering their own, harassed their squares by repeated charges, when at 4 o'clock in the afternoon Desaix's troops arrived upon the field and took a position on the left. Victor's and Lannes's corps were re-formed on the right, the cavalry were concentrated in front of the village of San Julianò, and immediately in their rear was planted a masked battery under the direction of Marmont. Bonaparte, feeling that the crisis of the day had arrived, rode along the front of the line, and in a brief, characteristic speech restored the confidence of his men. "Soldiers," he said, "we have now retired far enough; you know that it is always my custom to sleep on the field of battle." The troops replied with loud acclamations, and the battle commenced with renewed vigor. A formidable column of Hungarian grenadiers headed by Zach at once advanced upon San Julianò, but recoiled before the discharge from Marmont's battery; while at the same moment Desaix vigorously assaulted them from the left. By great exertions Zach succeeded in restoring order in his front, and Desaix's corps, deprived of their commander, who received a musket ball in the heart as he was leading on the advance, was momentarily checked. An obstinate conflict ensued, the result of which was long doubtful. At length Kellermann, perceiving a break in the Austrian column, charged through it with 800 heavy cavalry, recharged, and traversed it several times. The column, severed in the centre, was thrown into confusion, and while the front with Zach himself surrendered at discretion, the remainder fled across the plain toward the village of Marengo in wild confusion, dispersing in their course the reserves

which were approaching to their assistance. The rout of the Austrians now became complete, and a mingled mass of horse, infantry, and artillery pressed onward to gain the bridges which crossed the Bormida. The French, after reoccupying the positions held by them in the morning, pursued the fugitives until nightfall. The loss to the Austrians in this battle was 7,000 men killed and wounded, 3,000 taken prisoners, 20 pieces of artillery, and 8 standards. The French, who brought about 25,000 men into the field, lost also about 7,000 in killed and wounded and 1,000 prisoners. An armistice followed, by the terms of which the Austrians were allowed to retire beyond the Mincio on condition of giving up all their fortified places in Italy west of that river.

MARGARET, queen of Navarre, or Margaret of Angoulême, born in Angoulême, April 11, 1492, died at the chateau of Odoas, in Bigorre, Dec. 21, 1549. She was the daughter and eldest child of Charles of Orleans, count of Angoulême, and of Louise of Savoy. Her father died when she was in her 12th year, but she was well educated by her mother, and at the court of Louis XII. She was married in 1509 to Charles, duke of Alençon, a prince of the blood royal, but who has suffered in history, as he did at the time, by the splendor of the alliance that was made for him. The 5 years that immediately followed this marriage were passed in the duchy of Alençon; but when Margaret's brother became king of France as Francis I. (1515), she not only became attached to his court, but had a large part in the government. She was superior to her brother in ability, and her learning and wit made her the fit companion of the statesmen of those times. She spoke several languages fluently and correctly. After the defeat and capture of her brother at Pavia, in Feb. 1525, Margaret aided her mother to carry on the government for some months; but in August she went to Madrid, where Francis was then a prisoner to Charles V. Her visit was reputed to have saved his life, as he was suffering from illness and mortification, and her mind was so much stronger than his that she raised him from despair. Her warm reproaches to the emperor, because of his unchivalrous treatment of Francis, had a powerful effect even on his cold nature. She managed the negotiations that took place, and promoted the marriage between Francis and Eleanor, sister of the emperor, and queen dowager of Portugal. The duke of Alençon, her husband, died April 11, 1525. She was spoken of as a wife for Henry VIII.; but that monarch, who was then infatuated with Anne Boleyn, could have never seriously thought of marrying her. She became the wife of Henri d'Albret, count of Béarn, and titular king of Navarre, whose kingdom was held by Charles of Spain. Francis, beside bestowing a liberal portion on Margaret, pledged himself to effect

the restoration of her husband to the throne of Navarre; but circumstances baffled his purpose. Margaret was very anxious for her husband's restoration, and the subject is often mentioned in her correspondence. In 1529 she and her husband retired to the principality of Béarn, where they labored with success for the improvement of the country. Margaret also paid much attention to the government of her duchy of Alençon, and in all her relations with the people she appears to have admitted the doctrine of responsibility beyond any sovereign of her time. She sympathized with the reformers, several of whose leaders, and especially Calvin, were protected by her in Béarn against their persecutors. How far she favored the new doctrines is unknown, and it has been asserted by adherents of the old faith that she admitted, some time before her death, that she had been in error; and when dying, according to one of their number, she declared that what she had done for the reformers was owing more to her compassion than from ill will to Rome. It is certain, however, that the zealous Catholics regarded her as a heretic, and that one of her works, "The Mirror of the Sinful Soul," contains Protestant doctrines. The Sorbonne censured it, and it was denounced in other ways. Francis was told that if he wished to destroy the heretics, he must begin with the queen his sister; but, though cruel and selfish, he never would allow her to be injured, and even punished some of those by whom she had been insulted, or who had sought to poison his mind against her. Margaret was a voluminous writer, as well in verse as in prose, and one of her works, the *Heptaméron* (translated into English by Kelley), is an old French classic. It is written in imitation of the *Decamerone* of Boccaccio, but was left incomplete at her death, as it contains but 72 tales, instead of the hundred originally intended. It is so far an original work, that most of the adventures described in it are those which befell some of the author's contemporaries. Next to the *Heptaméron* is *Le miroir de l'âme pécheresse*, above mentioned. She wrote, also, many poems, dramas, poetical epistles, rondeaux, and the like, several of which have been printed, while others remain in manuscript. On the death of Francis I., in 1547, Margaret, who was much afflicted by his loss, became devout, and passed most of her time in seclusion, and solaced her mind with religious thoughts and literary pursuits. Her daughter, Jeanne d'Albret, who married Antoine de Bourbon, became the mother of Henry of Navarre, afterward Henry IV. of France, and founder of the royalty of the house of Bourbon. The best life of Margaret of Navarre is that by Martha Walker Freer (2 vols., London, 1854).

MARGARET OF ANJOU, queen of England, daughter of René, count of Provence, and titular king of Sicily and Jerusalem, and of Isabella of Lorraine, born at Pont-à-Mousson, a castle in Lorraine, March 23, 1429, died at the chateau of Dampierre, Aug. 25, 1481. Her childhood

was passed, amid many troubles that befell her family, in Italy, France, and Lorraine. Her hand was sought by the count de St. Pol and by the count de Nevers. As a Provençal princess she was well educated, and at an early period of her life manifested considerable talent. Report of her beauty having reached Henry VI. of England, from a gentleman of Anjou, who acted under the inspiration of Cardinal Beaufort, her portrait was obtained for his inspection. This decided the king's action, and commissioners were appointed to negotiate a truce with France and Burgundy, Charles VII. favoring the marriage of Henry and Margaret, with the view of making it the basis of peace between France and England. The earl of Suffolk had the chief part in the transaction on the English side, to his final ruin. Not only was no dowry asked with Margaret, but England ceded Anjou and Maine to René, who claimed them as his hereditary dominions. The war party in England, headed by the duke of Gloucester, opposed both the peace and the marriage, but the Beaufort party proved victorious; and Suffolk, who was elevated to a marquissate, was authorized to marry Margaret as Henry's proxy. This ceremony took place at Nancy in Nov. 1444. Margaret did not reach England until the next April, when her marriage took place in Titchfield abbey. In 1447 occurred the death of the duke of Gloucester, of which she has been considered guilty by some historians, but without evidence. She soon became unpopular, and the English connected the loss of their French possessions with her marriage. The York family, taking advantage of the weakness of the king, aimed to obtain the crown, which belonged to their chief by the law of descent. Margaret's only child, a son, born Oct. 18, 1458, was said by her enemies to be either the offspring of adultery, or a supposititious child. Prince Edward was born while his father was suffering from one of his fits of imbecility, and when the queen was at the head of the government. The duke of York was made protector, but on the restoration of the king's health he was dismissed, whereupon he asserted his right by an appeal to arms, and the Yorkists won the first battle of St. Albans, which restored them to power. Parliament censured the queen and her friends, but in 1456 Henry assumed his rights, and the government was virtually in Margaret's hands. Personal ill feeling between the queen and the earl of Warwick, the most powerful of the Yorkist leaders, caused a renewal of the war, and the Lancastrians were at first victorious; but the Yorkists rallied, defeated their foes, and obtained possession of the king's person, who recognized York as his successor. Margaret fled, with her son, first to Wales, and thence to Scotland. Receiving assistance from the Scotch, she returned to England, and was joined by her supporters in the northern counties. York advanced to oppose her, and was defeated and slain at Wakefield, the queen behaving with cruelty after the battle. March-

ing to London, she defeated Warwick in the second battle of St. Albans, and released her husband. The Londoners, disgusted with the ferocity of her northern troops, would not admit her into their city, but recognized York's eldest son as king, by the title of Edward IV. She retreated north, and was followed by Edward. The great battle of Towton, March 29, 1461, was fatal to the Lancastrian cause. Margaret fled to Scotland with her husband and son. Thence she went to France, in the hope of obtaining aid from Louis XI., in which she met with little success. Pierre de Brezé, seneschal of Normandy, armed in her support, and by his aid she landed in England, but accomplished nothing, and returned to Scotland. There she raised forces and invaded England, and at first obtained some successes, but only to be defeated utterly in the battle of Hexham, in 1464. She returned again to Scotland, and afterward to Flanders. After residing some time at Bruges, she took up her residence in her father's dominions, where she superintended her son's education, aided by Sir John Fortescue. She kept up her connection with her English adherents, and it is stated that she once visited England, in the dress of a priest. She visited the French court, at Tours, in 1469; and it was under the mediation of Louis XI. that a reconciliation between her and the earl of Warwick was effected in 1470, the earl having broken with Edward IV. and fled from England. The earl's youngest daughter, Anne Neville, was betrothed to the queen's son, Edward of Lancaster. The Lancastrians were for the time triumphant; Edward IV. fled to the continent, and Henry VI. regained the throne. Margaret prepared to return to England, but contrary winds delayed her purpose, and it was not until April 13, 1471, that she landed at Weymouth, accompanied by her son. Warwick, however, had been defeated and slain in the battle of Barnet, and the queen took sanctuary in Beaulieu abbey. Some of the Lancastrian leaders, who had a strong force on foot, induced her to join them. While seeking to effect a junction with their friends in Wales, the Lancastrians were assailed and defeated at Tewkesbury, May 4, 1471, by Edward IV. Margaret fell into the hands of the victor, her son having previously been slain. She was imprisoned in the tower, and afterward at Windsor and at Wallingford, until Nov. 3, 1475, when she was ransomed by Louis XI., who paid 50,000 crowns for her liberty, her father having ceded Provence to him for the purpose. She formally renounced all the rights her English marriage had given her, and resided in deep seclusion at Reculée, near Angers, one of the possessions of her father, seldom leaving that retreat. Disease in its worst form preyed upon her person, and her last days were passed in the chateau of Dampierre, where she was entertained by the kindness of its lord, to whom her father at his death had consigned her. MARGARET OF AUSTRIA, daughter of Maximilian I., emperor of Germany, and of Mary of

Burgundy, born in Ghent in 1480, died in Brussels, Dec. 30, 1530. Before she was 8 years old she was, by the treaty of Arras, concluded between her father and Louis XI. of France, affianced to the dauphin, with a large territorial dowry. To prepare her for her future station, she was educated at the French court; but Charles VIII. broke the contract, and returned her to her father, in order that he might wed Anne of Brittany, whom Maximilian himself was seeking in marriage. This gross insult, which happened in 1494, was never forgiven by the house of Austria. In 1495 a treaty of alliance was made between Maximilian and Ferdinand and Isabella, one of the terms of which was that John, prince of the Asturias, and heir apparent of the Spanish sovereigns, should marry Margaret. Sailing for Spain in winter, the weather was so stormy that many of the vessels composing the fleet were wrecked, and that which bore the princess was in great danger of being lost; but she was so cool that she wrote her own epitaph:

*Ci gist Margot, la gentil' damoiselle
Qu'a deux maris, et encore est pucelle."*

Landing in Spain in March, 1497, Margaret was married to Prince John on April 3. Their union was of brief endurance, as John died of fever on Oct. 4. In a few months Margaret gave birth to a still-born child, and in 1499 she returned to the Netherlands. She was espoused for the third time in 1501, when she became the wife of Philibert the Fair, duke of Savoy, who died without issue in 1504. She did not again marry, though at one time it was in contemplation to bestow her hand on Henry VII. of England. On the death of her brother Philip in 1506, she was made regent of the Netherlands by her father, and superintendent of the education of her nephew, afterward the emperor Charles V., and his sister Mary. She was an able ruler, and was concerned in some of the principal negotiations of that time, proving herself a vindictive enemy of France, and a zealous servant of the house of Austria. In connection with Louise of Savoy, mother of the king of France, she negotiated the treaty of Cambray, in 1529, between Francis I. and Charles V., which was called "the ladies' peace," the terms of which were most humiliating to the French. This was her last important work, as she died in the following year. Throughout her life she showed a fondness for literary pursuits, and wrote well in both prose and verse.

MARGARET OF DENMARK, called the Semiramis of the North, queen of the united kingdoms of Denmark, Sweden, and Norway, born in 1353, died in Nov. 1412. She was the 8d daughter of Waldemar III., king of Denmark, and at the age of 13 was married to Hacon, king of Norway. Upon the death in 1387 of Olaf, the offspring of this marriage, and the king of Denmark and Norway, she procured her election as queen of the former kingdom, and by skilful management soon after secured the crown of Norway. In 1388 the Swedes,

who were oppressed by their king Albert, having offered her the throne of that kingdom, she defeated Albert, who after 7 years' imprisonment was released on condition of formally resigning his crown. Thenceforth she reigned with absolute authority. When urged to secure an heir to her thrones by another marriage, she promised to designate a successor, and at the assembly of the estates of the three kingdoms at Calmar, in 1397, presented to the deputies her grand-nephew Eric as her appointed heir. On this occasion, by her eloquence and address, she procured the adoption of a fundamental law, called the "Union of Calmar," establishing a perpetual union of the three kingdoms. Eric was at the same time associated with her in the government, but he did not assume supreme authority until her death. Although holding extreme opinions on the royal prerogative, Margaret was in the main a just and magnanimous sovereign, notwithstanding that Swedish historians accuse her of duplicity and violence in her transactions with that kingdom. She insured the strict administration of justice, repressed piracies and private oppression, developed the physical resources of her dominions, and fostered commerce. Her prudence, adroitness, and resolute bearing in conducting foreign relations, proved her to be one of the most accomplished politicians of the age; and during her reign the three kingdoms reached a considerable degree of power and prosperity.

MARGARET OF PARMA, regent of the Netherlands under Philip II. of Spain, born in 1522, died in Naples in 1586. She was the natural daughter of Charles V. by Margaret Van der Genst, a lady of a noble Flemish family in Oudenarde, and received an education suited to her rank in the household of Mary, queen dowager of Hungary. When only 12 years of age she became the wife of Alessandro de' Medici, grand duke of Tuscany, a man of profligate habits, and her senior by about 15 years. Within a year of the marriage Alessandro was assassinated by his kinsman, Lorenzino de' Medici, and the young widow, upon reaching the age of 20, was united to Ottavio Farnese, then 13 years old, receiving as her dowry the duchies of Parma and Piacenza. Toward Farnese she entertained feelings little different from contempt. Her birth, her masculine bearing, her undoubted capacity and training in the astute school of Italian politics, and above all her orthodoxy in matters of religion, suggested her to Philip, when about to take his departure from the Netherlands in 1559, as a suitable person to fill the office of regent of those provinces. She arrived in the Netherlands in June, 1559, and in August entered upon the discharge of her duties. Her administration, which lasted 9 years, and witnessed the opening scenes in the great revolt of the Netherlands, was mild and beneficent in comparison with those which followed. "Upon the dark ground of succeeding years," says Motley, "the lines which recorded her history seemed written with letters of light. Yet her

conduct in the Netherlands offers but few points for approbation, and many for indignant censure. That she was not entirely destitute of feminine softness and sentiments of bounty, her parting despatch to her brother proved. In that letter she recommended to him a course of clemency and forgiveness, and reminded him that the nearer kings approached God in station, the more they should endeavor to imitate him in his attributes of benignity. But the language of this farewell was more tender than had been the spirit of her government." She was amply pensioned by Philip, and passed the remainder of her life chiefly in Italy. Her tastes, including her love for the chase, were masculine; and in personal appearance, "she seemed," in the language of a contemporary historian, "like a man in petticoats," the illusion being heightened by a natural moustache upon her upper lip. Her death was caused by the gout.

MARGARET OF VALOIS, queen of France, born in 1552, died in Paris, March 27, 1615. She was the daughter of Henry II. and of Catharine de' Medici, and was celebrated for her beauty, her profligacy, and her talents. The third duke of Guise, Henri de Lorraine, would have married her, though aware of her vices; but she desired a crown, and agreed to become the wife of Sebastian of Portugal, a union which was prevented by the influence of Spain. In 1572 she was married to the king of Navarre, afterward Henry IV. of France, the marriage being the pretext on which the leading Protestants were assembled at Paris, to be massacred on the eve of St. Bartholomew. Her mother sought her consent to have her marriage with a heretic annulled, but this Margaret refused. There was no attachment between her and her husband, and she hated his religion. After his escape, Margaret, though not at once, was permitted to join him at Béarn, where she remained 5 years, tolerating the king's infidelities, though he would not tolerate her religion. In 1581, on the invitation of her mother, she returned to the French court. There the profligacy of her life drew upon her the condemnation of her brother, Henry III., who compelled her to return to her husband, by whom she was received with bitter reproaches. She fled from him, and took up her residence at Agen, whence she made war on him as a heretic. That place being taken in 1585, she vainly sought another asylum, and was seized and imprisoned in the fortress of Usson; but her arts made her mistress of the place, from which she drove the governor, and held it for 20 years. She became queen of France in 1594, on the triumph of her husband, but he refused to restore her to freedom until she should renounce her rank, to which she would not consent until after the death of Gabrielle d'Estrées. They were divorced in 1599, but she did not recover her liberty until some years later. She visited the court in 1605, where she did homage to her successor, Maria de' Medici. The remaining 10 years of her life were passed at Paris or in its

vicinity. Almost to her last days she led a vicious life; but at length she fell into hypochondria, and was terrified at the approach of death. She founded the convent of the Petits Augustins in Paris, the inmates of which were required to have fine voices, and she instructed the children of the choir in the music she preferred. Her *Mémoires*, written by herself, are valuable because of the details they contain of the last days of the line of Valois.

MARGARIN, and MARGARIO ACID. When olive oil is cooled down to 32° F. and submitted to pressure, a solid residuum is obtained, which, when more completely separated from the oily portion after melting and slowly cooling to the temperature of 55° or 60° by a second pressing, is the substance called margarin. It dissolves in about 400 times its weight of boiling alcohol, and separates in pearly scales as the alcohol cools; whence its name, from Gr. *μαργαρίτη*, a pearl. By repeated solutions and crystallizations it is rendered pure. Its composition is represented by the formula $C_{100}H_{104}O_{12}$. It is also obtained from human fat, goose grease, and other fatty substances. When saponified it yields an acid in the form of white pearly scales or fine needles, called margario acid. This, according to Heintz, is a compound of stearic and palmitic acids, into which it may be separated.

MARGARITA, an island in the Caribbean sea, off the coast of Venezuela, to which it belongs; length about 45 m., breadth from 5 to 20 m.; area, 441 sq. m.; pop. in 1854, 23,967. It consists of two portions, connected with each other by a low and narrow isthmus. The surface is rocky and mountainous, especially toward the W., where it attains an elevation of 8,000 feet above the sea. The coast is rugged and precipitous, but is indented with excellent harbors, the chief of which, Pampatar, is a spacious basin, deep and well sheltered. The interior is fertile. It was formerly celebrated for its pearl fishery; but the pearls are now less abundant, smaller, and of inferior quality. It was discovered by Columbus in 1498, and in 1816 was the scene of a sanguinary struggle between the patriots and the Spanish troops under Murillo, which resulted in the defeat of the latter. Capital, Assumption.

MARGARITONE D'AREZZO, an Italian artist, born in Arezzo about 1215, died there after 1289, aged 77. He was essentially a painter of the Byzantine school, and attained great celebrity in Italy before the time of Cimabue. He executed many works in fresco and distemper in the churches and convents of Arezzo, of which few remains are now to be seen. His "San Francisco," however, which Vasari calls one of his masterpieces, and which is engraved in Lastri's *Etruria Pittrice*, still exists, and bears his inscription: *Margariton de Aretio pingebat*. He was more celebrated as a sculptor than as a painter, and one of his chief works, a reclining statue of Pope Gregory X., is still preserved in the cathedral of Arezzo. He superintended the building of that edifice after the designs of the

original architect, and is supposed to have designed the governor's palace in Ancona in 1270.

MARGATE, a seaport town of England, on the isle of Thanet, county of Kent, 15 m. N. E. from Canterbury, and 72 m. E. by S. from London; pop. in 1851, 9,107. The great source of prosperity is the visitors in summer, who occasionally number, it is said, 100,000.

MARHEINEKE, PHILIPP KONRAD, a German theologian, born in Hildesheim, May 1, 1780, died in Berlin, May 31, 1846. He was educated at Göttingen, where he was appointed *repetent*, and subsequently became university preacher; in 1806 he became extraordinary professor of theology at Erlangen; in 1809 ordinary professor at Heidelberg; and in 1811 ordinary professor at Berlin, and pastor of the church of the Trinity. The first edition of his *Grundrissen der christlichen Dogmatik*, which was founded on the philosophy of Schelling, appeared in 1819. He represented "the evolutions of religion in the doctrine and worship of the church as the theses of history, the world and secular affairs as the antitheses, above both of which hovers sublime and unmoved the autothesis God, whose recognition in all its processes and relations constitutes the principle of history." The second revised edition (Berlin, 1837) was adapted to the Hegelian philosophy, and was thoroughly recast. His most important historical work is the *Geschichte der Deutschen Reformation* (4 vols., Berlin, 1816-'34), which reproduces many documentary records, and sounds in brief and profound characterizations of men and events. In his *Christliche Symbolik* (3 vols., Heidelberg, 1810-'14), and his *Institutiones Symbolicae* (8d ed., 1830), he took a historical and comparative rather than dogmatic view of the principal Christian creeds. The practical results of his aim to demonstrate the unity and harmony of the Scriptures, the church, and the reason appear in his *Entwurf der praktischen Theologie* (Berlin, 1837). He published several volumes of minor writings and sermons, was one of the editors of the works of Hegel, and was prominent in the doctrinal controversies of his time, especially in those excited by the *Symbolik* of Möhler, and by the mystical tendencies of Görres, both of whom he opposed.

MARIA CHRISTINA, queen dowager of Spain, born in Naples, April 27, 1806. Her father was Francis I., king of Naples, and her mother Maria Isabel, daughter of Charles IV. of Spain. The late king of Naples was her brother, and the duchess of Berry is her step-sister. Her elder sister Louisa Carlotta, who lived in constant warfare with her husband, the Spanish infante Francisco de Paula, prevailed upon her to become the 4th wife of the infante's brother, Ferdinand VII. of Spain. Maria Christina's marriage with him took place at Madrid in 1829, to the great consternation of the Carlists, whose hope that the childlessness of the king would secure to Don Carlos the succession to the throne was prostrated by the

restoration on March 29, 1830, of the law by which the crown was made heritable by the female line. Maria Christina gave birth to a daughter, the present Queen Isabel, on Oct. 10, 1830. In 1832, when the king was supposed to be dying, the Carlists extorted from him a decree which cancelled the law of March 29 and excluded Isabel from the throne. But Louisa Carlotta, in concert with Maria Christina, foiled this attempt of the Carlists by causing the king to cancel the decree. On Oct. 1, 1832, Maria Christina, at the request of the king, took the reins of government into her own hands, and courted popularity by promulgating a general amnesty two weeks afterward. The official decree declaring the law obtained from him during his sickness null and void was issued by the king on Dec. 31, 1832, and for some time he personally resumed the conduct of affairs, but died Sept. 29, 1833. In his will he appointed Maria Christina regent and guardian of Isabel, and of a second daughter that she had borne to him in 1832, and who afterward became the wife of the duke of Montpensier, son of Louis Philippe. Maria Christina assumed the regency Oct. 2, 1833. She presently conceived a violent passion for Ferdinand Muñoz, a private soldier in the royal body guard, whose parents had a tobacco shop at Tarancon, where he was born, and which to this day is kept by his mother; and she married him secretly, Dec. 28, 1833. Meanwhile she more and more lost ground with the people, partly on account of her subserviency to the *moderado* party and to France, to which policy she was instigated by her ministers Martinez de la Rosa and Toreño, but chiefly owing to her clandestine relations with Muñoz. The new charter which she had granted was far from giving satisfaction to the provinces, which revolted. In the night of Aug. 18, 1836, a regiment of the provincial militia entered her palace of La Granja near Madrid, and after being joined by a corps of the guards stationed in the palace, they compelled the queen regent to dismiss her ministers and swear to the constitution of 1812; and a new constitution was promulgated, June 18, 1837. Her position, however, continued precarious. The ministers Toreño, Zea Bermudez, Martinez de la Rosa, and Isturiz, who were successively at the head of affairs, were unable to restore her popularity. This received the greatest blow from her decree, issued June 15, 1840, in obedience to French influence, which put an end to the old municipal liberties of Spain. The people rushed to arms, and she abdicated on Oct. 10 in favor of Espartero as regent, and repaired to Paris. After the downfall of Espartero, she returned to Madrid in 1843. On Oct. 13, 1844, she celebrated her marriage with Muñoz in public, on which occasion she created him duke of Rianzarea. After the declaration of the majority of Isabel, she continued to intermeddle in public affairs until 1854, when she was expelled from Spain by a new revolu-

tionary movement. She retired with her husband and the 10 children she had borne him to France, where she had purchased the chateau of Malmaison.

MARIA DE' MEDICI, queen of France, daughter of Francis I., grand duke of Tuscany, and of the archduchess Johanna of Austria, born in Florence in 1574, died in Cologne, July 8, 1642. She was educated in utter seclusion, and knew nothing beyond the circle of the Florentine court, when, in 1599, her hand was asked for Henry IV. of France of her uncle, Ferdinand I., grand duke of Tuscany. Her marriage with Henry had been contemplated 7 years before; though but for the interposition of Philip II. of Spain she would have married the duke of Parma. Rudolph II., emperor of Germany, had thought of marrying her, or of giving her in marriage to whichever of the archdukes should be chosen to succeed him. Her health and beauty declined, and she had become almost a middle-aged woman, according to Italian reckoning, when she was wedded to Henry IV. In 1601 she gave birth to the first dauphin who had been born since 1548, in the person of the prince who became Louis XIII. Maria had great cause to complain of the infidelities of her husband, though her own character has not escaped unblemished; and not only were her complaints loud, but on one occasion she would have struck him but for the interposition of Sully. Henry often threatened to send her back to Italy, with her favorites the Concinis, by whom she was ruled. Her coronation did not take place until May 18, 1610, the day before her husband was assassinated. By the aid of the duke of Epernon, colonel-general of the French guard, she became regent. She got rid of Sully, and soon her government became one of the worst ever known to France. Her favorites, the Concinis, were put to death in 1617, and she was herself exiled to Blois, her son being the chief of her enemies. She was freed from prison by Epernon, and a reconciliation was effected between her and her son. It was chiefly through the aid of Richelieu that this was done, and by the same assistance Maria maintained her ascendancy at court for some years. Becoming jealous of Richelieu, she sought to overthrow his power, but was defeated and imprisoned in 1631. Escaping to the Netherlands, she remained there until 1638, and was concerned in many intrigues against the government of Richelieu. She went to England in 1638, her daughter Henrietta Maria being queen in that country. Charles I. endeavored to prevail upon the French government to allow her to return to France, but unsuccessfully; and she became so unpopular in England that the long parliament requested her to leave that kingdom. She departed in Aug. 1641, parliament giving her £3,000, and promising her £6,000 more. Passing through Holland she reached Antwerp, and took up her residence in the house of Rubens, whose patron she had been. After residing there for some weeks, she was ordered to leave Ant-

werp, and to proceed to Cologne, where she arrived Oct. 12. Here she finally died, in a squalid chamber.

MARIA LOUISA, the 2d wife of Napoleon I., born in Vienna, Dec. 12, 1791, died there, Dec. 18, 1847. She was a daughter of the emperor Francis and of the Neapolitan princess Maria Theresa. After having discarded Josephine, and almost entirely broken the power of Francis, Napoleon I. selected her as his wife; and the marriage, which was celebrated in Paris, April 2, 1810, resulted, March 20, 1811, in the birth of a son. She retired to her native country in April, 1814, after the abdication of her husband, and did not comply with his request to rejoin him in Paris after his return from Elba. She afterward contracted a morganatic marriage with her chamberlain, Count Albert Adam of Neipperg, by whom she had several children. According to the treaty of Fontainebleau she was invested in 1816 with the government of the Italian duchies of Parma, Piacenza, and Guastalla. The revolution of 1831 compelled her to leave Parma, and she remained in Piacenza until after some time order was restored by Austrian arms. She was absent from Parma during the outbreak of June, 1847, and died in Vienna soon afterward.

MARIA THERESA, a German empress, and queen of Hungary and Bohemia, born in Vienna, May 18, 1717, died there, Nov. 29, 1780. She was the daughter of the emperor Charles VI. of Hapsburg, whose principal aim during a long reign seemed to be to secure to his heiress the succession to all the hereditary dominions of his house. By ample cessions of territory to various princes of Europe, he finally attained a general acknowledgment of the "pragmatic sanction;" and Maria Theresa, a princess of rare beauty and talents, received not only an education fitting her future condition, but was also early initiated into the secrets of state and admitted to the council of her father. She was married to Francis Stephen of Lorraine, afterward grand duke of Tuscany, and eventually German emperor under the name of Francis I., who was always glad to leave affairs of state to his consort, while he employed himself in profitable private speculations. Scarcely, however, had Charles closed his eyes (Oct. 20, 1740), when the work of his life seemed to crumble to pieces. The pragmatic sanction was disregarded, and claimant after claimant raised pretensions to the whole or parts of his possessions. The young princess saw herself surrounded by enemies; Frederic the Great of Prussia occupied Silesia; Charles Albert of Bavaria was elected emperor under the name of Charles VII.; Spain, Sardinia, and Augustus III. of Poland and Saxony threatened to enforce various claims by the power of arms; and France, which had no rights of succession of its own, was ready to support those of others. George II. of England alone proved a faithful ally; and the enthusiasm of the Hungarians for their young queen, who put herself and her

infant son Joseph under their protection at the diet of Presburg (1741), became a support powerful beyond all expectation. Frederic made peace at Breslau (1742), retaining his conquest, Silesia; but Charles VII. lost even his own dominion, Bavaria. This success of the Austrian arms, however, raised the apprehensions of Frederic, and the second Silesian war ensued (1744), France simultaneously declaring war against England. Louis XV. himself appeared on the field, and Marshal Saxe won battle after battle in the Netherlands; Frederic, too, was successful. Saxony, however, was now the ally of Maria Theresa; Charles VII. died soon after reëntering his capital Munich, and his son and successor not only renounced all his claims, but also supported the election of Maria Theresa's husband to the imperial throne of Germany (1745). Frederic, confirmed in the possession of Silesia, made peace at Dresden (1745). The war against Spain and France was continued, Marshal Saxe being victorious at Fontenoy (1745), Raucoux (1746), and Laffeld (1747), while England was successful against the pretender, in the colonies, and on the seas. Elizabeth of Russia declaring for Maria Theresa, the war was favorably enough terminated by the peace of Aix la Chapelle (1748), Austria ceding Parma, Piacenza, and Guastalla to Don Philip, prince of Spain, and some districts of the duchy of Milan to Sardinia. Maria Theresa now turned her principal attention to the internal affairs of her states. Following chiefly the advice of her minister Kaunitz, she introduced numerous reforms, organized the administration, alleviated the burdens of the peasantry, abolished torture, created various institutions of learning, promoted industry and trade, and, though a zealous Catholic herself, subjected the papal bulls to the *placet regium*, and on the abolition of the order of Jesuits by the pope expelled its members from her states. In regard to Hungary, she observed a mild but slowly denationalizing policy. "Maria Theresa," says Szemere in his "Hungary from 1848 to 1860" (London, 1860), "during her long reign, by dint of royal flattery, winning manners, intermarriages of Hungarian and German families, and well calculated invitations of our principal nobles to a court exclusively German, well nigh succeeded in denationalizing the Hungarian aristocracy." The external diplomacy of Kaunitz was also active, and when he finally succeeded in gaining over with Mme. de Pompadour the court of France, in addition to the alliance of Russia and the house of Saxony, Frederic sought and obtained the alliance of England, and the 7 years' war began (1756), of which the Prussian monarch became the hero, London and Daun being his most effective Austrian enemies. The war extended to almost all parts of the world, from the coast of Coromandel to Canada, and nearly all powers partook in it. The double peace of Versailles and Hubertsburg (1763) terminated it to the advantage of Prussia and England, Frederic re-

maining now undisputed master of Silesia. Two years later Francis I. died, and was succeeded in the empire by his son Joseph II., and in Tuscany by Leopold, their sister Marie Antoinette being afterward married to the future French king Louis XVI. Joseph, however, enjoyed in the hereditary states of his mother only the rights of a co-regent, though his influence generally prevailed in foreign affairs, as in the case of the annexation of Galicia at the first division of Poland (1772), and of Bukovina from Turkey (1777). The peace of Teschen (1779) terminated, according to the energetic decision of the old empress, the war of the Bavarian succession. Her death made room for the reformatory career of the ambitious and philanthropic Joseph.

MARIANA, JUAN, a Spanish historian and theologian, born in Talavera in 1586, died in Toledo, Feb. 6, 1628. He was educated at the university of Alcalá, and when 17 years of age joined the society of Jesus. In 1561 he was appointed professor of theology in the Jesuit college at Rome, where one of his pupils was Bellarmine, afterward cardinal. From Rome he was sent to Sicily to deliver an initiatory course of divinity in that island; and thence in 1569 to Paris, on a similar mission. Eminent success attended his labors in both cases; but his health failing, he passed the rest of his life at the Jesuit house in Toledo. Having been employed to examine the polyglot Bible edited by Arias Montanus at Antwerp in 1569-'72, which had been denounced to the inquisition by the Jesuits, he returned a favorable opinion of it, which brought upon him the displeasure of his superiors. The unpleasantness of his position was increased by his arrangement of the *Index Expurgatorius* of 1584, and still more by his work *De Rege et Regis Institutione* (Toledo, 1599), in which he intimates that in some cases kings may be put to death. In Paris, where Henry III. had been assassinated a few years before, it was condemned to be burned by the common hangman. It aroused a violent controversy, and brought great popular odium upon the order to which Mariana belonged. In 1609 Mariana published at Cologne "Seven Theological and Historical Treatises," two of which, "On Mortality and Immortality," and "On Weights and Measures," were censured by the inquisition, the first on theological, the second on political grounds, and the author was subjected to imprisonment and penance. The work by which he is most favorably known, however, is his "History of Spain," to which he devoted the last 30 or 40 years of his life. It was written both in Latin (1592-1609) and Spanish (1601; enlarged ed., 1628), and extends from the supposed peopling of Spain by Tubal, son of Japhet, to the accession of Charles V., with a summary of later events, down to 1621, by Mariana himself. Though not always to be trusted, it is picturesque, graceful, animated, and adorned by an idiomatic richness, "in which," says Ticknor, "among Spanish prose compositions, the style of Mariana is all but unrivalled." There is an

English translation by Steevens (London, 1699). Among his other works are *Scholia Brevia in Vetus et Novum Testamentum* (Madrid, 1619), and *Discursus de Erroribus qui in Forma Gubernationis Societatis Jesu occurrunt*, published after his death (Bordeaux, 1625).

MARIE, ALEXANDRE THOMAS, a French lawyer and statesman, born at Auxerre, department of Yonne, Feb. 15, 1795. In 1842 and again in 1846 he was elected a member of the chamber of deputies for the 5th arrondissement of Paris, his election having been chiefly due to the popularity which he had gained at the bar by his defence of political offenders. On Feb. 24, 1848, he zealously opposed the project of a regency, and advocated the establishment of a provisional government, of which he became a member as minister of public works. In this capacity he organized the famous *ateliers nationaux*, but more from necessity than from real socialistic conviction, as he personally belonged to the moderate class of republicans. He was elected to the constituent assembly by a great majority, and became a member of the executive committee. After the insurrection of June he was made president of the assembly. On July 15 he was called upon by Gen. Cavaignac to join his administration as minister of justice. Previous to the election of Louis Napoleon to the presidency of the French republic Marie was inclined to conservative measures, and voted for the prosecution of Louis Blanc and Caussidière, against the abolition of capital punishment, and against other progressive measures. But subsequently to that event he adopted more liberal views, opposing the siege of Rome, and generally combating the policy of the new government. He was not reelected to the legislative assembly in 1849, and has since devoted himself exclusively to the practice of his profession.

MARIE AMÉLIE, queen of the French, born at Caserta, near Naples, April 26, 1782. Her father was Ferdinand I., king of the Two Sicilies, and her mother Maria Carolina, archduchess of Austria. One of her sisters was Maria Theresa, the empress of Francis of Austria, and another was grand duchess of Tuscany. In 1798, when Naples was invaded by the French, she retired with her mother to Palermo, spent several years in Vienna, and returned to Naples in 1802, but along with the other members of the royal family was soon again compelled to leave the capital. While at Palermo with the court she became acquainted in 1808 with Louis Philippe, whose wife she became, Nov. 25, 1809, the marriage being celebrated in the royal chapel. Henceforward sharing the destinies of her husband, she resided with him at the chateau of Neuilly in 1830, where, during his temporary absence, she received M. Thiers and Ary Scheffer, who came to urge upon Louis Philippe the acceptance of the crown. Louis Blanc says in his "History of Ten Years:" "While M. Thiers was unfolding the purport of his message, great uneasiness was depicted on the austere counte-

nance of the duchess; and when she learned that it was proposed to convey into her family a crown snatched from the head of an old man who had always proved himself a faithful kinsman and generous friend: 'Sir,' said she, addressing M. Scheffer, with an emotion full of true greatness, 'how could you possibly take upon yourself such a commission? That M. Thiers should have done so does not so much surprise me: he does not know us well; but you who have been admitted to our intimacy, who have had opportunities of appreciating us—ah! we can never forgive you this.' The arguments of the two negotiators were not of a nature to move the humble and pious soul of the duchess of Orleans, but they found acceptance with her sister-in-law, Mme. Adelaide." After the accession of her husband to the throne, Marie Amélie devoted herself exclusively to domestic life, where she was remarkable for virtues, accomplishments, and piety. Sharing the flight of her husband in Feb. 1848, she retired with him to Claremont, near London, taking the title of countess of Neuilly, and there she still resides. She has survived three of her children, the princesses Marie and Louise and the duke of Orleans; also her husband, who died in 1850, and two of her daughters-in-law, the duchess of Nemours (died 1857) and Helena, duchess of Orleans (died 1858). Her remaining children are the prince de Joinville, the dukes de Nemours, Montpensier, and Aumale, and the princess Clémentine, who married the prince Augustus of Saxe-Coburg-Gotha. The late king of Naples was her nephew; she is also the aunt of the duchess of Berry, of Maria Christina of Spain, of the ex-grand duchess of Tuscany, and of the empress of Brazil. Few royal ladies have commanded such universal feelings of respect as this venerable woman, who spends her latter years in the zealous practice of religious duties and charities, surrounded by a number of her children and grandchildren, and having but little social intercourse excepting with the members of the royal family of England and a few select friends.

MARIE ANTOINETTE, JOSÉPHINE JEANNE DE LORRAINE, queen of France, daughter of Francis I., emperor of Germany, and Maria Theresa, born in Vienna, Nov. 1, 1755 (the day of the famous earthquake at Lisbon), guillotined in Paris, Oct. 16, 1793. In her youth, her teacher of Italian was Metastasio; of music, Gluck; and of French, the abbé Vermond. Her grace and dignity of person were adorned by the variety of her attainments. From an early age she had been contracted in marriage, and as soon as she reached her 15th year (1770) her hand was demanded by Louis, then dauphin, and afterward king of France. In surrendering her daughter to him, Maria Theresa wrote that, as she had ever been the delight of her mother, so she would prove to be the happiness of her husband. All the way from Vienna to Compiègne, where she first met her future husband, she was conducted by the dignitaries of France,

who had been sent to her as an escort, and her progress was a kind of triumphal procession. Married May 16 of the same year, at Versailles, the event was celebrated with all the pomp and parade which marked the luxurious court of Louis XV. Yet it was a topic for observation at the time that a series of sinister omens seemed to attend all these festivities. Shortly after the nuptials a thunder storm of unprecedented violence filled Versailles with terror. During the preparations for the magnificent fêtes at Paris which followed, a scaffolding erected for the fireworks suddenly gave way, and 60 persons were killed and nearly 800 seriously wounded. The kindness displayed by Marie Antoinette toward the sufferers won for her the quick hearts of the French. She became thenceforth for a while an idol of the people. After the birth of one of her sons, as she repaired to the services of the church, the populace desired to unharness her horses and themselves draw her carriage; and when she refused this homage, choosing rather to alight and walk, they surrounded her in crowds, and rent the air with their acclamations. It is to this period that Burke refers, when he speaks of her as "glittering like the morning star, full of life, and splendor, and joy." In 4 years the death of Louis XV. made her husband king as Louis XVI., and herself queen. One of her first acts after her elevation evinced the magnanimity with which she had resolved to reign. An officer of the body guards, who had previously given her some cause for umbrage, fancied that it would be his duty to resign in consequence of it; but on tendering his resignation, the queen refused to accept it, saying, in imitation of a similar remark by Louis XII., that "the queen did not remember the quarrels of the dauphiness, nor should M. de Pontecoulant recollect what she had forgotten." The remission of a customary tax, also, when she came to the throne, increased her charms in the eyes of her subjects. She founded a hospital for the aged and poor, and a lying-in asylum; and she built cottages for the accommodation of the humble. Her manners were inartificial even to familiarity, and while she abhorred the flatteries of the court and persistently refused to listen to its scandal, she was yet ever gracious and kind. As described to us in contemporary memoirs, Marie Antoinette was then rather charming than handsome. Her features were not regular (says Madame Le Brun, who painted her and must have studied her face): "she derived from her family that long, narrow oval peculiar to the Austrian nation; her nose was thin, and the lips rather thick;" but her complexion was one of extraordinary brilliancy, her carriage at once elegant and easy, her figure dignified yet graceful, and her conversation replete with a mingled vivacity, benevolence, and grace. "Few approached her for whom she had not a kind, or at least a courteous word." Lord Holland, who did not see her, however, until her countenance had been somewhat disfigured by sufferings, is disposed to

doubt the rumors of her beauty, and imputes to her a total want of judgment and temper. It is certain, whatever her qualities of person and deportment, that they did not commend her to the vain and voluptuous people who had been educated in the time of Louis XV., or whose plans of aggrandizement had been disconcerted by her advent. She was accused by pretended friends of too open a disregard of the prescribed exigencies and the etiquette of her rank; while more open enemies insinuated darkly of walks at early dawn with the young duke of Chartres, of stolen visits to the opera in a fiacre, and of incognito conversations, under the veil of night, with clerks of the departments. But a greater cause of crimination grew out of her undissembled interest in politics, and the use of her power over the king and her brother Joseph of Austria to control, as it was alleged, the negotiations of the two nations. There were strong parties in France eager to foment the general jealousy of Austrian influence. Pamphlets were published which did not scruple to charge her with reckless extravagance, a licentious levity, and enmity to France. The extraordinary incident of the diamond necklace, which exposed her to the suspicion of a base intrigue with Cardinal de Rohan, and was made the subject of a legal inquest, added fuel to the flame of private and public calumny already kindled. When the states-general assembled in 1789, she attended it only to receive the homages of a few and the indignities and menaces of the many, so far was her prestige and consideration already lost. The political agitations of France, which had been growing for centuries, now broke forth into open revolution. In the fearful excitement of the times, the injurious reports against her in the court were carefully cherished by the people. She was held responsible in the minds of many for the vacillation of her husband, the incapacity of ministers, the degeneracy of society, the absolute and inevitable course of events. Nor did her own conduct, often haughty and imperious, more often thoughtlessly imprudent, tend to allay the effervescence of which she was the cause. It was her fatality that nearly all her interventions in the affairs of the state, however well intended, were unhappy. The daughter of a great empress, and wife of a powerful king, trained in all the sentiments of her exalted position, she was but ill qualified to adjust questions as to the relative rights of monarch and subjects, when those subjects were in a state of frenzied revolt. Appearing with her husband at the famous banquet given at Versailles, Oct. 1, 1789, by the body guards to the officers of the garrison, in which the national cockade was said to have been trampled in the dust, she was identified with the insult in the popular resentment. On the 3d this imprudent banquet was repeated. On the 4th Paris was in an uproar. On the 5th a tumultuous mob, consisting in great part of intoxicated and frantic women, rushed from Paris to Versailles to assail the royal palace

with clamors for bread and vengeance. They broke into the palace, where two life guards, defending the apartments of the queen, were slain; the queen took refuge in the king's chamber; and the most terrifying confusion reigned everywhere till Lafayette, with a body of grenadiers, succeeded in quelling the tumult. A cry was then raised that the king should go to Paris; he appeared upon the balcony and was received with plaudits; Marie Antoinette appeared amid an ominous silence, when Lafayette, stooping to kiss her hand, discharged the wrath of the mob into a volley of cheers. On the afternoon of the 6th the royal family went to Paris, surrounded by the motley crew of insurgents, who all the way sang their revolutionary songs and shrieked their wild rallying cries. It is not true, however, as is commonly reported, that they bore on pikes before the queen the heads of the two guardsmen who had been slain. In June, 1791, when her husband attempted to escape from France, she accompanied him, refusing, as she had constantly done in every emergency, to abandon his person or cause. They were arrested at Varennes and brought back to the Tuileries. When the committee of the constituent assembly demanded an explanation of the attempt, she replied that whither her husband wished to go it was her duty and pleasure to follow. Their subsequent residence at the Tuileries was scarcely more than a continued imprisonment. For a short period they were permitted to reside at St. Cloud, where the king opened negotiations with Mirabeau, at the instigation of the queen, in the hope of composing the troubles in the state by the aid of that powerful tribune; but the death of Mirabeau shortly afterward defeated what could have been at best but an impotent endeavor. The fanaticism of revolution was on the eve of the reign of terror. Louis XVI. was adjudged guilty of tyranny, and condemned to death (Jan. 17, 1793). During his trial Marie Antoinette preserved the utmost firmness and composure. Conveyed to the Temple, she endured the privations of her position, not stoically, but resignedly, devoting her time to the consolation of her family. On Jan. 21, 1793, her husband was executed, and his death was the prelude of her own. The convention, having decreed that she should be tried, ordered her separation in captivity from her son. At 2 o'clock of the morning of Oct. 14 she was summoned to the tribunal. The trial was a mockery of justice. Her replies to the numerous questions addressed to her, some of them in the grossest degree indelicate, were temperate, clear, and firm. When asked why the sentence of death should not be pronounced against her, she disdained the expression of any complaint, reproach, or justification. Marie Antoinette had often been imprudent, often vain and frivolous, often perhaps too tenacious of the opinions incident to her birth and rank; but in these closing scenes we can see her only as the

noble persecuted woman. The day after the close of her trial she was led to the scaffold. The interval had been passed in writing a tender letter to her sister, in prayer, and in sleep. Dressed in pure white, she was placed on a hurdle with her arms bound behind her back, and so conducted to the guillotine, which was erected on the Place de la Révolution. Wherever she passed, the windows, walls, trees, and roofs were loaded with spectators. On the scaffold she was sedate, intrepid, yet courteous. Her head fell, and the revolution, says Lamartine, "believed itself avenged when it was only the more irretrievably disgraced." Marie Antoinette had 4 children: a daughter who died in infancy; the dauphin, who died in 1789; the young Louis, who perished in the Temple in 1795; and Marie Thérèse Charlotte, who became the wife of the eldest son of Charles X.—See *Mémoires sur la vie privée de Marie Antoinette*, by Mme. Campan (Paris, 1823); *Histoire de la révolution, par deux amis de la liberté*; Buchez and Roux, *Histoire parlementaire*; Lacretelle, *Histoire de France pendant le XVIII^e siècle* (6 vols., Paris, 1850).

MARIENBAD, a watering place in Bohemia (pop. 800), within a short distance of Carlsbad, annually visited by thousands of persons, and containing a number of mineral springs, beneficial for diseases of the chest, bowels, and skin, as well as for rheumatic complaints. The waters of some of the springs, particularly that of the Kreuzbrunnen, are largely exported to foreign countries. The watering place began to be frequented about 1805.

MARIENZELL, a village in Styria, 55 m. S. W. from Vienna (pop. about 1,000), situated in a picturesque country, and celebrated for its shrine of the Virgin, which makes it the principal resort of pilgrims (100,000 a year) in the Austrian empire.

MARIETTA, the capital of Washington co., Ohio, on the Ohio and Muskingum rivers at their confluence, 104 m. S. E. from Columbus: pop. in 1850, 3,175; in 1858, 4,000. It is regularly laid out, with wide streets and neatly built houses, and contains a court house, gaol, bank, and 12 churches. The educational institutions consist of a union school, 2 academies, a lyceum, Marietta college, founded in 1835, and having in 1859 5 professors, 56 students, and a library of 15,500 volumes, and the western liberal institute, founded in 1849 under the direction of the Universalists. The town is the oldest in the state, having been settled in 1788 by New Englanders under Gen. R. Putnam, and named in honor of Marie Antoinette. It is the E. terminus of the Marietta and Cincinnati railroad. On the site of Marietta there is a remarkable group of ancient works, which are described in Squier and Davis's "Ancient Monuments of the Mississippi Valley" as consisting of "two irregular squares (one containing 40 acres area, the other about 20 acres), in connection with a graded or covered way, and sundry mounds and truncated pyramids. The town of

Marietta is laid out over them, and, in the progress of improvement, the walls have been considerably reduced and otherwise much obliterated; yet the outlines of the entire works may still be traced. The walls of the principal square, where they remain undisturbed, are now between 5 and 6 feet high by 20 or 30 feet base; those of the smaller enclosure are somewhat less. The entrances or gateways at the sides of the latter are each covered by a small mound placed interior to the embankment; at the corners the gateways are in line with it. The larger work is destitute of this feature, unless we class as such an interior crescent wall covering the entrance at its southern angle."

MARIETTE, AUGUSTE ÉDOUARD, a French Egyptologist, born in Boulogne, Feb. 11, 1821. He was educated at the college of Boulogne, in which he was subsequently a teacher of grammar and of drawing. He early became interested in antiquities, and his first publication, *Lettres à M. Bouillet* (Paris, 1847), was a dissertation on the names of the cities that had formerly occupied the site of Boulogne. Egyptian hieroglyphics attracted his attention, and by the aid of books he became so well versed in Egyptology that he was appointed in 1848 to a situation in the Egyptian museum in the Louvre; and in 1850, at the recommendation of the institute, he was sent by the French government on a scientific mission to Egypt. There his attention was chiefly directed to the remains of Memphis, the ancient capital, and he began a series of excavations, which, carried on with skill and energy, led to most important discoveries. Mr. Bayard Taylor, who visited him in 1851 at the scene of his explorations, gives the following account of his labors: "The loose sand, stirred by our feet, slid back into the bottom, as if eager to hide the wonders it disclosed. Pavements, fresh as when first laid, basement walls of white marble, steps, doorways, pedestals, and fragments of pillars glittered in the sun, which after the lapse of more than 2,000 years beheld them again. I slid down the side of the pit, and walked in the streets of Memphis. The pavement of bitumen, which once covered the stone blocks, apparently to protect them and deaden the noise of horses and chariots, was entire in many places. Here a marble sphinx sat at the base of a temple, and stared abstractedly before her; there a sculptured cornice, with heavy mouldings, loomed against the walls of the chamber into which it had fallen; and over all were scattered fragments of glazed and painted tiles and sculptured alabaster. I asked M. Mariette what first induced him to dig for Memphis in that spot, since antiquarians had fixed upon the mounds near Mitrahenny (a village in the plain below, and about 4 miles distant) as the former site of the city. He said that the tenor of an inscription which he found on one of the blocks quarried out of these mounds, induced him to believe that the principal part of the city lay to the westward, and therefore he commenced excavating in the near-

est sand hill in that direction. After sinking pits in various places, he struck on an avenue of sphinxes, the clue to all his after discoveries. Following this, he came upon the remains of a temple, probably the Serapeum or temple of Serapis mentioned by Strabo, and afterward upon streets, colonnades, public and private edifices, and all other signs of a great city. The number of sphinxes alone, buried under these high sand drifts, amounted to 2,000, and he had frequently uncovered 20 or 30 in a day. He estimated the entire number of statues, inscriptions, and reliefs at between 4,000 and 5,000. The most remarkable discovery was that of 8 colossal statues, which were evidently the product of Grecian art. During 18 months of assiduous labor, with but one assistant, he had made drawings of all these objects and forwarded them to Paris. The man's appearance showed what he had undergone, and gave me an idea of the extraordinary zeal and patience required to make a successful antiquarian. His face was as brown as an Arab's, his eyes severely inflamed, and his hands as rough as a bricklayer's. The space explored by M. Mariette is about a mile and a half in length, and somewhat more than half a mile in breadth. He was then continuing his excavations westward, and had almost reached the first ridge of the Libyan hills, without finding the termination of the ruins. The magnitude of his discovery will be best known when his drawings and descriptions are given to the world. A few months after my visit, his labors were further rewarded by finding 18 colossal sarcophagi of black marble; and he has recently added to his renown by discovering an entrance to the sphinx." His latest discovery (1860) is a tomb at Thebes of a queen never before opened, containing ornaments and other objects of great interest and value. M. Mariette has published the result of his researches at Memphis in a pamphlet entitled *Choix de monuments et de dessins découverts ou exécutés pendant le déblayement du Sérapéum de Memphis* (Paris, 1856). This pamphlet is intended only as a specimen of a more elaborate work upon which he is engaged.

MARIGOLD, the usual name of certain showy garden flowers, of which the common marigold (*calendula officinalis*, Linn.) is a familiar instance. They belong to the natural order of *compositae*, and are conspicuous from a certain kind of beauty during the warmest season of the year. The flowers have been rendered double in cultivation, by the outer or ray florets increasing in undue proportion over the inner or disk florets. The common marigold was once used in cookery, imparting a flavor to soups and broths, and thus has long had a place in the kitchen garden. It was formerly, among other uses, employed as a carminative; and its dried florets were used to adulterate saffron, and by dairy maids to impart a rich color to their cheese and butter. There are lemon-

colored varieties, but the usual color is a rich orange yellow. Both the single and double flowered kinds are employed for border plants; but the double sorts are preferable. The small Cape marigold (*C. pluvialis*, Linn.) has pretty white flowers, which are of a brownish tint beneath. Its specific name is derived from its blossoms closing on the approach of a shower. A few species of the genus *calendula* are found native of the S. of Europe and Asia, but the greater number of them belong to the Cape of Good Hope.—Some species of annual *tagetes* are known in the gardens as French and African marigolds, and possess some claim to beauty. The former (*T. patula*, Willd.) is cultivated in Japan and China, and in many parts of India, but does not appear to be a native of those countries. Some varieties with superbly striped petals are known to florists. The latter (*T. erecta*, Willd.) varies somewhat in the color of the flowers, also in having the florets curiously quilled. The more double the flowers, the more are they esteemed; but unless care is taken to preserve seed from the choicest kinds, the plants will soon degenerate. The odor of the *tagetes* is peculiar and repulsive; but there is a South American species called the sweet-scented (*T. lucida*, Willd.), and of a different style of inflorescence. The different sorts are readily raised from seeds, sowing in June in the open ground or earlier in hotbeds, and transplanting when 5 or 6 inches high.—On the alluvial banks of rivers, from Illinois southward, is an American plant belonging to this same group, known as the fetid marigold (*dysodia chrysanthemoides*, Lagasca), furnished with pellucid glands, which give out a strong odor; the flower heads are terminal and the flowers yellow. Several composite-flowered plants growing in wet places throughout the United States, with showy yellow blossoms, are called burr marigolds, and are species of the genus *bidens*.

MARIN, a W. co. of Cal., bordered on the E. by the bays of San Pablo and San Francisco, and on the S. and W. by the Pacific ocean; area, 700 sq. m.; pop. in 1858 estimated at 8,800. The surface is rugged and mountainous, and but a small portion of the soil is adapted for cultivation. The valleys are highly productive. The productions in 1859 were 21,840 bushels of wheat, 56,800 of barley, 180,000 of oats, 124,000 of potatoes, 210,000 lbs. of butter, and 150,000 of cheese. Capital, San Rafael.

MARIO, GIUSEPPE (marquis de Candia), an Italian singer, born in Turin in 1810. He received an excellent musical education, and in 1836 entered the Sardinian military service. He had been exiled to Cagliari for certain shameful indiscretions, he resigned his commission upon the refusal of government to accept his resignation, he escaped to Paris, and his admirable tenor voice soon attracted attention in the musical saloons of that city. an engagement at the French opera at a liberal salary, assumed the name of Mario, and, after two years' study at the conservatory, made his début in Dec. 1838, in *Robert le diable*, with decided success. In the succeeding year he sang with Rubini at the Italian theatre, and formed one of that brilliant galaxy of singers then upon the stage, comprising Rubini, Lablache, Malibran, Sontag, Persiani, and Grisi, of all of whom, with the exception of the two last named, he is at present the survivor. Since that period he has been constantly before the public, and now occupies the position of the first tenor singer upon the stage. After performing principally in London and Paris, he visited Russia in 1845, remaining there 5 years, and has during the last 10 years sung in London in the spring and summer and in Paris in the winter. In 1854-'5 he accompanied Grisi with whom he has lived for many years and by whom he has a family of children, on an operatic tour through the chief cities of the United States. As a singer he is distinguished by a voice of great purity and sweetness, by graceful vocalization, and by an excellent method. He possesses respectable dramatic abilities, and excels in the performance of parts like Almaviva in the "Barber of Seville." Among the operas in which he has principally appeared are *Tancredi*, *La gazza ladra*, *Cenerentola*, *Moses*, and others by Rossini; *La Sonnambula*, *Norma*, and *I Puritani*, by Bellini; *Lucia di Lammermoor*, *La Favorita*, *Lucrezia Borgia*, *Don Pasquale*, &c., by Donizetti; and *Ernani*, *La Traviata*, and *Il Trovatore*, by Verdi. In 1859 he appeared in London and Paris in the part of Don Giovanni, in the opera of that name, transposed to suit his voice.

MARION, the name of counties in 15 of the United States. I. A N. W. co. of Va. drained by the Monongahela river and its branches; area, 275 sq. m.; pop. in 1850, 10,555; of whom 94 were slaves. It has an undulating surface, with considerable woodland, and a fertile soil. Coal and iron ore abound. The productions in 1850 were 48,469 bushels of wheat, 167,071 of Indian corn, 1,096 lbs. of tobacco, and 84,916 of wool. There were 17 grist mills, 11 saw mills, 21 churches, and 720 pupils attending schools. Value of real estate in 1850, \$2,669,902; increase since 1850, 80 per cent. The Baltimore and Ohio railroad intersects the county, passing through the capital, Fairmount. II. An E. district of S. C., bordering on N. C. and drained by the Great and Little Pee Dee rivers; area, 1,200 sq. m.; pop. in 1859, 21,500, of whom 9,500 were slaves. The surface is level and the soil moderately fertile. The productions in 1850 were 476,718 bushels of Indian corn, 151,482 of sweet potatoes, 513,825 lbs. of rice, and 8,680 bales of cotton. There were 21 grist mills, 20 saw mills, 84 churches, and 400 pupils attending schools. The Wilmington and Manchester railroad intersects the district, passing through the capital, Marion Court House. III. A W. co. of Ga., drained by tributaries of the

Chattahoochee and Flint rivers; area, 432 sq. m.; pop. in 1859, 7,191, of whom 3,459 were slaves. The surface is undulating and the soil generally fertile. The productions in 1850, since which its limits have been reduced, were 33,904 bushels of Indian corn, 81,870 of sweet potatoes, and 7,149 bales of cotton. There were 4 grist mills, 3 saw mills, 1 woollen factory, 22 churches, and 596 pupils attending schools. The Muscogee railroad crosses the N. W. corner of the county. Capital, Buena Vista. IV. A central co. in the peninsula of Fla., bounded S. W. by the Withlacoochee and intersected by the Oklawaha; area, 3,100 sq. m.; pop. in 1850, 4,338, of whom 1,269 were slaves. The surface is level and the soil fertile. There are numerous lakes, of which the largest are Lakes Orange, Bryant, and Ware. The productions in 1850 were 21,425 lbs. of rice, 701 bales of cotton, 508 bbls. of sugar, and 81,625 galls. of molasses. Capital, Ocala. V. A N. W. co. of Ala., bordering on Mississippi, drained by branches of the Tennessee, Tombigbee, and Sipsey rivers; area, 1,050 sq. m.; pop. in 1850, 7,833, of whom 998 were slaves. The surface is uneven and the soil generally fertile. The productions in 1850 were 91,495 bushels of Indian corn, 39,648 of sweet potatoes, 7,825 lbs. of rice, and 1,552 bales of cotton. There were 8 grist mills and 4 saw mills. Capital, Pikeville. VI. A S. co. of Miss., bordering on La., drained by Pearl river and Black creek; area, 1,224 sq. m.; pop. in 1850, 4,410, of whom 2,195 were slaves. It has an undulating surface, and a fertile soil on the borders of the streams. The productions in 1850 were 130,504 bushels of Indian corn, 62,465 of sweet potatoes, 134,540 lbs. of rice, and 1,411 bales of cotton. There were 20 grist mills, 3 saw mills, 5 tanneries, 6 churches, and 132 pupils attending schools. Capital, Columbia. VII. A W. co. of Ark., bordering on Mo., drained by White river and its branches; area, 650 sq. m.; pop. in 1854, 3,719, of whom 159 were slaves. It has a hilly surface and fertile soil. It contains lead ore, and a variegated marble is found in the W. part. The productions in 1854 were 25,570 bushels of Indian corn, 8,400 of wheat, and 17,480 of oats. Capital, Yellville. VIII. A S. co. of Tenn., bordering on Ala. and Ga., and intersected by the Tennessee and Sequatchie rivers; area, 600 sq. m.; pop. in 1850, 6,314, of whom 551 were slaves. The surface is hilly and broken, being traversed by ridges of the Cumberland mountains. The productions in 1850 were 468,294 bushels of Indian corn, 56,945 of oats, 27,930 of sweet potatoes, and 6,538 lbs. of tobacco. There were 60 grist mills, 4 tanneries, 20 churches, and 1,120 pupils attending schools. Capital, Jasper. IX. A central co. of Ky., drained by the Rolling fork of Salt river; area, 304 sq. m.; pop. in 1850, 11,765, of whom 3,086 were slaves. The surface is hilly and the soil generally fertile. The productions in 1850 were 1,001,919 bushels of Indian corn, 213,319 of oats, 16,450 lbs. of tobacco, and 88,568 of wool. There were 15 churches, and 1,573

pupils attending schools. Capital, Lebanon. X. A central co. of Ohio, drained by the Scioto, Little Scioto, and Whetstone or Olentangy rivers; area, 384 sq. m.; pop. in 1850, 12,618. It has a level surface and fertile soil. The productions in 1850 were 32,806 bushels of wheat, 559,794 of Indian corn, 99,937 of oats, and 126,595 lbs. of wool. There were 4 grist mills, 3 saw mills, 2 iron foundries, 1 woollen factory, 3 tanneries, 12 churches, and 2,300 pupils attending schools. The Bellefontaine and Indiana railroad intersects the county, passing through the capital, Marion. XI. A central co. of Ind., drained by the West fork of White river and by Eagle and Fall creeks; area, 360 sq. m.; pop. in 1850, 24,103. It has a nearly level surface and fertile soil. The productions in 1850 were 1,123,860 bushels of Indian corn, 110,834 of wheat, 89,318 of oats, and 51,193 lbs. of wool. There were 28 grist mills, 41 saw mills, 2 woollen factories, 8 cotton factories, 4 tanneries, 99 churches, and 5,156 pupils attending schools. A number of railroads concentrate in the capital, Indianapolis. XII. A S. co. of Ill., drained by Skillet fork of Little Wabash river and several creeks; area, 579 sq. m.; pop. in 1850, 6,720; in 1855, 10,139. It has an undulating surface and fertile soil. The productions in 1850 were 5,813 bushels of wheat, 413,335 of Indian corn, 71,557 of oats, and 22,116 lbs. of wool. There were 16 grist mills, 3 saw mills, 2 woollen factories, 2 tanneries, 9 churches, and 688 pupils attending schools. The Illinois central and the Ohio and Mississippi railroads intersect the county, the latter passing through the capital, Salem. XIII. A N. It has an undulating surface, mostly prairie; the soil is very fertile. The productions in 1850 were 105,841 bushels of wheat, 668,658 of Indian corn, 65,384 of oats, and 39,088 lbs. of wool. There were 15 grist mills, 9 saw mills, 7 tanneries, 23 churches, and 1,436 pupils attending schools. The Hannibal and St. Joseph railroad intersects the county, passing through the capital, Palmyra. XIV. A S. central co. of Iowa, intersected by the Des Moines river; area, 576 sq. m.; pop. in 1859, 16,167. The surface is undulating, with much prairie, and the soil fertile. The productions in 1859 were 80,325 bushels of wheat, 4,688 of oats, 729,173 of Indian corn, 7,623 tons of hay, 25,849 lbs. of wool, 220,820 lbs. of butter, and 17,536 galls. of sorghum molasses. Capital, Knoxville. XV. A W. co. of Oregon, bounded W. by the Willamette river, and watered by the N. Santiam and other branches; area, about 1,200 sq. m.; pop. in 1858, 7,413. Toward the E. the surface is mountainous; the soil in the W. is fertile. The productions in 1850 were 86,165 bushels of wheat, 24,172 of oats, 15,224 of potatoes, and 3,093 lbs. of wool. Taxable property in 1858, \$2,299,709. Capital, Salem.

MARION, a village, and the capital of Perry co., Ala., on the Alabama river, 28 m. S. E. from Selma; pop. in 1860, about 2,500. It is connected with Selma by a branch of the Alabama and Mississippi rivers railroad, and another railroad, now in progress of construction, will connect it with Cahawba. It has 5 churches, 8 newspapers, and a monthly magazine, and is the seat of Howard college (controlled by the Baptists), 2 large female seminaries, St. Wilfrid's academy for boys, and a number of flourishing private schools.

MARION, FRANCIS, an American revolutionary general, born in Winyaw, near Georgetown, S. C., in 1732, died Feb. 29, 1795. He was of a Huguenot family, which emigrated from France to South Carolina about 1690. He received little education, for which the facilities in his native district were then very slight. At the age of 16 he embarked in a small vessel, with what object is not known, for the West Indies. The vessel foundered, and, though he had always seemed a weak and puny boy, he was one of the few who survived the wreck and the severities of starvation which ensued. On his return he resumed the habits of a farmer. In 1759 he was a volunteer in an expedition against the Cherokees, then occupying the whole N. and W. frontier of South Carolina, and served in a cavalry troop commanded by one of his 6 brothers. In 1760 and 1761 he was again in the field on similar expeditions. He led the forlorn hope in the battle of Etchoee, and was one of the few who escaped. The Cherokees having been subdued, he retired to private life, and does not appear again till in 1775, at the outbreak of the revolution, he was elected to the provincial congress of South Carolina from St. John's parish, Berkeley. As a civilian he made no figure, though the congress in which he sat committed the colony to the revolution. In the military organization which ensued, he was made (June 21, 1775) a captain in the regiment of which William Moultrie was colonel. This regiment became singularly efficient, and was soon required in active service. Marion's company was one of those despatched from Charleston for the capture of the British fort Johnson. The place was taken with little difficulty, and the guns promptly directed upon the men-of-war in the harbor. The British governor fled to the shipping, which was completely expelled from the harbor by the cannon from another fort established by Moultrie on Haddrell's point. Among the other fortifications was a station at Dorchester, which was confided to Marion, who was promoted in his regiment. He was soon summoned thence to the defence of the fort begun on Sullivan's island, menaced by a powerful British fleet. It was assailed before it was finished, and in the engagement (June 28, 1776) Marion greatly distinguished himself. The hostile fleet was repelled with great loss, narrowly escaping destruction, and the carnage, for the numbers engaged, was unsurpassed by that of any battle on record. In

Feb. 1777, Marion was despatched with 600 men to the defence of Georgia, where he served at intervals until the British with overwhelming forces had gained possession of the state. Fort Moultrie (Sullivan) was again confided to his charge, and he held this position during Gen. Prevost's attempt at a *coup de main* on Charleston (1779), and while the forces of the latter had possession of the neighboring islands. Subsequently he joined the united French and American forces in the attack on Savannah. He did not conceal his indignation at the course of D'Estaing in according to the British, beleaguered in Savannah, the time which they required to put themselves in a proper state of defence. The event confirmed his apprehensions, and the allies were repulsed with great slaughter. South Carolina was now left almost defenceless. The French fleet and army abandoned the coast, the regiments of the colony were reduced to skeletons, Georgia was in the possession of the enemy, and the continental army in the South was few in numbers, poorly armed, and wanting in supplies and resources of every kind. It was at this juncture that the British, with a powerful army by land and sea, assailed South Carolina and besieged its capital city. During the siege, which lasted for 6 weeks and until the garrison had exhausted their provisions, Marion accidentally broke his leg, and was therefore conveyed with all other invalids out of the city. He recovered slowly, and was obliged to conceal himself and frequently change his quarters before the advancing columns of the enemy, which overran the country. As he grew able for service, he gathered his neighbors about him, patriotic farmers and hunters, and seizing what arms could be found, rusty firelocks, swords hammered out of mill saws, knives, and hatchets, he laid the foundation of that brigade which finally became famous for its partisan successes. Meantime Gen. Gates had been despatched by congress to take command of the southern army. At the approach of the continental forces, Marion, then a colonel, joined them in North Carolina; but so wretched were his equipments, so paltry his numbers, without regimentals, ragged, and deficient in weapons, that Gates remarked only the ridicule which they provoked in the camp, and failed to appreciate their patriotism and ability. He despatched Marion on an idle mission to cut up the boats on the rivers to prevent the escape of the British. In a few days Gates was defeated in the disastrous battle of Camden (Aug. 1780), while Marion, waylaying the British guards, dispersed them and rescued their continental prisoners. Had he and his men been employed as a scouting force, this shameful surprise at midnight would have been avoided. From this period dates the long series of adventurous night forages, marches, countermarches, surprises, and sharp passages of war, which distinguished the brigade of Marion until the establishment of peace. Small means achieving great results, an army confronted by troopers and riflemen,

who had not a good sword upon which to rely, nor ammunition for a 3 hours' conflict; patriots sustaining themselves in arms, winter and summer, in mountains and in swamps, without clothes or blankets, pay or provisions, ever assailing the enemy at any unguarded point, darting between his fortresses, snatching up his foragers, cutting off his detachments, sweeping away his supplies and baggage wagons—such were the features of Marion's warfare. He kept alive the spirit of patriotism, taught the inexperienced frontiersman how to be both bold and vigilant, how to discipline himself, and how to arm and support himself, at a time when the country had no resources for him. Meantime Marion was promoted to a brigadiership, and his command was termed a brigade whether it numbered 20 or 1,200 men. It was a peculiarity of the service under him that the men were allowed to go and come almost as they pleased. They left him, however, only for his and the public interest, storing harvests, which were immediately placed in his hands. The corn, rice, and cattle of the Carolinas were the provisions of the continentals, and the indigo crop the specie used to buy clothing and ammunition; and thus it was necessary for the brigade to be a mobile body, fluctuating in numbers, the members, whether present or absent, being busy in the common cause under the guidance of one master mind. Soon after Marion had rescued the prisoners made at Gates's defeat, he surprised and completely dispersed a crowd of loyalists and refugees under Major Gainey. Within 24 hours he encountered a second body under Col. Barfield, which he outwitted and discomfited. These and other exploits alarmed the British, and Tarleton was sent with an overwhelming force to cut off "the swamp fox," the *nom de guerre* already won by him. Baffling this superior foe by retreats, and hotly pursued, he nevertheless managed to surprise and defeat two smaller forces, performing a series of strategic manoeuvres utterly unaccountable to the British commander. The moment that Tarleton gave up the pursuit, Marion made an ineffective dash upon the garrison at Georgetown. It is impossible to pursue in detail the progress of so restless and eager a chieftain in a career marked by so great a variety of action and resource. Even popular tradition fails to follow him. His camp at Snow's island, his potato feast to the British officer, his quiet humor when dealing with both friend and foe, his perpetual vigilance and sudden and efficient movements, have all entered into the legends of the country. Though Snow's island, a natural fortress of swamps and forests accessible only under good guidance, was his favorite camp and hiding place, yet he had other retreats in almost every swamp of Carolina, where he found ready refuge from a superior enemy, and whence he could rapidly emerge upon any body of men approaching his own in numbers. His food was chiefly potatoes and corn, and of these the supply was always scanty; his only drink was vine-

gar and water; for months he slept without a blanket, and marched without a hat; and he trained his followers to his own habit of cheerful endurance. He disciplined in his style of warfare many young officers, emulous of his skill, enterprise, and successes, and proving in time worthy of their master. At Snow's island a British officer bringing despatches concerning an exchange of prisoners was conducted blindfold to Marion's camp. The bandages being removed, he was astonished at finding the redoubted partisan the smallest person in his army. His officers, generally tall and stalwart, were grouped about him. The rangers, riflemen, and troopers were scattered about in the forests. The surprise of the Englishman was increased when, being bade to stay for dinner, he found the food to consist only of a peck of sweet potatoes roasted in the ashes of a neighboring fire, and served upon a fallen log. The drink was vinegar. He commented on the poverty of the fare, and was assured that it was better than usual. "But your commissariat?" "We have none." "Your pay is good?" "I have never received a dollar for my services, nor have my people." "What motive, what stimulus have you for fighting then?" "We fight for love of liberty," &c. The legend adds that the British officer was so much impressed with the conversation, that on his return to Charleston he resigned his commission and left the service. In 1781 Gen. Greene, superseding Gates, took command of the southern army. He was able to appreciate the courage and services of Marion, who had maintained an efficient independent organization. He now joined his brigade with the main army or acted separately, as the occasion or the wishes of the continental general required. He was Greene's great resource for obtaining intelligence; had his spies in the British camps and garrisons, in Camden, Charleston, Georgetown, and Savannah; was himself almost ubiquitous with his brigade, and always able to report some satisfactory result from his enterprises. Mounting his infantry behind his cavalry, he would make his way to the vicinity of the enemy, and crush any assailant who from the rapidity of his movement supposed him to be at the head of his cavalry only. His demonstrations, even when he had no ammunition, kept the British in continual apprehensions. Attempts to overreach or entrap him, to penetrate his recesses, or to intercept him between overwhelming forces drawn from opposite quarters, were all futile. He baffled Tarleton, Barfield, Doyley, Gainey, McArthur, Coffin, and Wemyss, all of whom were in turn or in concert despatched for his express capture or defeat. Cornwallis especially urged his ruin and that of Sumter, and affirmed that the former kept the whole country in terror from the Santee to the gates of Charleston. When he meditated some enterprises in which bayonets and a regular force were necessary, Greene joined Lee's legion to his brigade. Lee had difficulty in finding him, so warily did

he change his ground after he had once made his presence felt in any quarter. With the united forces, Marion made a second attempt on Georgetown, which like the first was only partially successful. The town was taken, but the garrison had time to strengthen themselves in the fortress, which could not be overcome without artillery. Lee soon after rejoined the main army under Greene, and Marion was left to his usual operations, capturing convoys, cutting off detachments, and skirmishing with the front or rear of marching bodies which he could not assail in pitched battle. Several of his engagements, which occurred almost daily, had but partial success, because instead of bullets he had only swan and duck shot. The British denounced his mode of warfare as unchristian, since he shot down sentinels, patrols, and scouting parties without beat of drum, beside perhaps mortifying their *amour propre* by the use of duck shot. They hanged three of his men whom they captured. He promptly retaliated, a measure which caused the abandonment of the practice. Meanwhile Cornwallis had driven Greene's army out of the state. But Marion held his ground, and while the continentals were flying through North Carolina, pursued by the British general, he was pressing his predatory warfare even to the gates of Charleston, and interrupted the line of communication between the metropolis and all the parts of the interior. Col. Watson with a picked force was sent to expel or crush him. Major Gainey, of whom great expectations were formed, was also sent in pursuit; yet he was attacked and defeated by Marion, narrowly escaping with his life. Col. Tyne, whom Marion had once before defeated, was also on his track, and was again foiled. Major McIlraith, sent with another division to cooperate with Watson, was in close pursuit of him, but by a remarkable play of strategies he baffled them both, so palpably that McIlraith was disgraced. The next auxiliary of Watson was Col. Doyle, subsequently distinguished as a British general in India. Each took the field with a regiment of British, and a large additional force of loyalists. Unable openly to meet either division, Marion determined to prevent their junction. Retiring before Watson after an engagement at Wiboo swamp on the Santee, he led him on from ambush to ambush, at every covert diminishing his numbers by his rifles, until after several days the relation of the parties was reversed. Watson fled before the brigade, and after a narrow escape into Georgetown affirmed that he had never before seen such shooting. Marion then turned upon Doyle, who made a precipitate retreat and avoided him. This retreat was in part occasioned by the necessities of the main British army under Rawdon, who called in his detachments at the approach of Greene. Marion returned against Watson, who had taken the field again with new recruits, but his want of ammunition rendered him unable to fight, and his opponent was soon summoned to join Rawdon.

Being again joined by Lee and supplied with ammunition, Marion determined to attack the British post of Fort Watson on the Santee river. It was on high ground, and the garrison laughed at his efforts without artillery to harm them. At length towers, made of logs, were extemporized during the night, and raised sufficiently high to enable the riflemen to plant themselves on an elevation equal to that of the fortress; and while the sharp shooters plied their bullets, a storming party scaled the walls, and the garrison surrendered. Lee then rejoined Greene, but after the battle of Hobkirk's Hill aided Marion in investing Fort Motte on the Congaree. The besiegers again felt the want of artillery, but Mrs. Motte, the original owner of the house around which the fort had been constructed, furnished an Indian bow with arrows, which, tipped with combustibles, set fire to the roof over the heads of the garrison, which then capitulated. Marion distinguished himself by prudence and humanity superior to his times, and prevented Lee's men from hanging some of the prisoners. Some causes of complaint prompted him soon after to resign his commission and join the main army under Washington; but Greene, who could hardly have dispensed with him, succeeded in dissuading and retaining him, and he was soon repeating his exploits on the skirts of Lord Rawdon's forces. While he had captured Forts Watson and Motte, Sumter had taken the forts at Orangeburg and Granby, and thus the connections of the British general with the interior were cut off. While thus holding Rawdon in check, Marion succeeded in capturing Georgetown, an event which provided him with a much needed suit of regimentals. He subsequently joined Greene and Sumter in the pursuit of Rawdon, till he intrenched himself in Orangeburg, and declined battle. After the evacuation of Orangeburg and the departure of Rawdon for Europe, the forces of Marion and Sumter swept the country to the very gates of Charleston. He then resumed his independent command in the Santee country. One of his lieutenants, Col. Harden, was despatched on an expedition to the south between the Edisto and the Savannah, and found himself suddenly confronted by the enemy in superior force. Marion hastened to his relief, and arrived not only in time to rescue him, but so quietly that he drew the British into an ambush and severely defeated them. He returned to the continental army under Greene, then approaching the enemy at Eutaw. Leading the militia of North and South Carolina in the battle which ensued, his troops were the first in action, and delivered 17 rounds before they yielded to the bayonet. He pursued the British on their retreat to Charleston, which they still held chiefly by means of their shipping, and lay in wait for detachments sent from the city on foraging expeditions. The British were gradually confined almost to the walls of Charleston, and the legislature of the state again assembled for the purpose of restoring civil authority. It was mainly an assembly

blage of military men, among whom was Marion. The brunt of the battle fell upon him when the British attempted to surprise the American army; and after the war seemed about to cease, and the enemy to depart, a new insurrection of the Tories under Major Gainey upon the Pedee drew him at full speed with his cavalry in that direction. So prompt were his measures that Gainey succumbed at once. The indulgent terms which he granted gave great offence to the more vindictive of his own followers. Returning to the region of the Santee and Cooper rivers at such speed as to break down half of his force, the British foragers disappeared before him, and he cut off a corps of negroes, called the black dragoons, which the British commander had formed in a moment of desperation. His vigilance had confined the British in Charleston, and prevented any passages of arms, before hostilities were formally terminated; and he steadily refused to engage in any unnecessary enterprise after the prospect of peace. He disbanded his brigade soon after the British fleet and army evacuated Charleston (Dec. 14, 1782), taking a tender farewell of his followers, and returned to the avocations of a farmer almost in poverty. He was subsequently returned to the senate of the state by the electors of St. John's parish, Berkeley, and gave new proofs of his unselfish patriotism. In 1784 he accepted the appointment under the state of commandant of Fort Johnson, and soon after married. In 1790 he was a member of the convention for framing a state constitution, and in 1794 he resigned his commission as one of the generals of the state militia. He was buried at Belle Isle, in the parish of St. John's, and a slight oblong tomb, the tribute of a private citizen, covers the remains of one of the purest men, truest patriots, and most adroit generals, that American history can boast.

MARIPOSA, an E. co. of Cal., drained by the San Joaquin and its branches, the Merced and Fresno, and Owens river; area, about 8,000 sq. m.; pop. in 1852, 8,969, of whom 4,533 were Indians; white pop. in 1858, estimated at 8,633. The surface is mountainous toward the E., being there traversed by the Sierra Nevada; the soil in the W. is considered to be of great fertility. Gold abounds throughout the county, being found in nearly every creek and gulch and in quartz veins. Silver ore is found at Quartzburg. The productions in 1859 were 5,600 bushels of wheat, 10,000 of barley, and 1,000 of oats. There were 5 saw mills, 32 quartz mills (cost \$30,000), and 65 m. of ditching. It contains the Yo Semite falls and the Mammoth Tree grove, for descriptions of which see CALIFORNIA. Capital, Mariposa.

MARITZA, or MARIZZA (anc. *Hebrus*), a large river of Roumelia, European Turkey. It rises on the N. E. flank of the Despoto-dagh, a branch of the Balkan mountains, flows S. E. and S. S. W., and after a course of 260 m., during which it passes Philopopolis, Adrianople, and Trajanopolis, enters the Grecian archipelago by two mouths.

MARIUS, CAIUS, a Roman soldier and statesman, born in the village of Cereata, near Arpinum, in the Volscian country, in 157 B. C., died in Rome in 86 B. C. His origin was humble, and his parents are said to have been clients of the Herennii, a noble plebeian family. That he ever labored for wages may be doubted, and the story may have been one of the reports invented to injure him by the *optimates*, and accepted by him to make his elevation seem the greater by contrast with his original position. Juvenal, who wrote in the character of a Marian, or anti-oligarch, at a time when the memory of the republican contests had not entirely passed away, speaks of Marius as having been a common laborer; but he was a satirist, and was professedly contrasting the virtues of the *novi homines* of an earlier period with the viciousness of certain illustrious persons, who were of patrician families. Marius had no third name, or cognomen, nor did he ever win one, notwithstanding his brilliant military services. A passage in Velleius Paterculus, which represents him to be of equestrian birth, is believed to be an error of some transcriber. Plutarch expressly states that his parents were both poor and obscure, and that they gained their living by the labor of their hands. The first mention of him in history is as a soldier in the army with which the second Scipio Africanus took Numantia, in 184 B. C., when he was but 28 years old. His bravery, his sobriety, and the readiness with which he submitted to the severe reforms that Scipio found it necessary to introduce into the Roman army, attracted the attention and won the commendation of that great general. Scipio is even said to have pointed out Marius as one fit to succeed him, a story probably invented after Marius had risen to eminence. The tradition was, that Marius was so encouraged by Scipio's words, deeming them to form a divine intimation, that he entered on a political career; yet it was not until 15 years later that he achieved his first political success, being then chosen tribune of the people (119 B. C.). This office he obtained through the influence of Metellus; and it is added that he had long been an adherent of the Metelli, who belonged to the Cæcilian *gens*, one of the most distinguished plebeian houses in Rome. This story does not agree with that which represents him as being a client of the Herennii. He had previously been unanimously elected military tribune. As tribune of the people he introduced a bill calculated to promote the freedom of elections, which was opposed by the *optimates*, then at the height of their power, immediately after the fall of Caius Gracchus; but Marius, by the most vigorous measures, carried his point, though the opposition was headed by his patron, the consul Metellus. He showed his firmness in another way, by opposing a distribution of corn among the people, because he believed it injurious to their interests. He sought the curule ædileship, but was forced to withdraw from the contest; and

he was beaten as a candidate for the plebeian ædileship. Elected to the prætorship, his name was the lowest on the list. He was then proceeded against for bribery. This was the work of the aristocracy, and he escaped conviction only because the votes of his judges were equal. He was prætor in 115, but did not leave Italy. As proprætor, the next year, he served in Further Spain, which he is reported to have cleared of robbers. Shortly afterward he married Julia, a sister of the father of Julius Cæsar, who belonged to one of the most illustrious of the patrician *gentes*. When Q. Cæcilius Metellus took command of the Roman army employed against Jugurtha (109), Marius became one of his legates, and greatly distinguished himself in the war, being very popular with the common soldiers, and attracted the attention of his countrymen at home. He asked leave of Metellus to go to Rome, that he might offer himself as a candidate for the consulship; but his commander, after first seeking to argue against his supposed unreasonable ambition, and then attributing his refusal to the state of the service, treated his request with contempt. Marius then commenced intriguing against Metellus, whom he accused of prolonging the war, which he offered to bring to a prompt conclusion with one half the force then employed against Jugurtha. These things were all known at Rome, where they increased the popularity of Marius. To get rid of an enemy, Metellus granted him the permission he had asked, but only 12 days before the time of election. Arrived at Rome, Marius entered on the contest at once, and became consul in 107, at the age of 50. He did not bear his success with meekness, but made use of the harshest language when speaking of the aristocracy. The province of Numidia was assigned him, which made him the successor of Metellus. In levying soldiers, he did not confine himself to the classes whence the legions had formerly been recruited, but enrolled men from the lowest orders, and slaves, which is regarded as the first of those acts through which the Roman armies were led finally to look more to their commanders than to the state for law. He led his new levies to Africa, where he waged the war against Jugurtha vigorously, until the latter took refuge with Bocchus, king of Mauritania, who betrayed him to Sylla, the quæstor of Marius, which caused Sylla to claim the merit of having closed the war, and so laid the foundation of a personal quarrel destined to have memorable consequences. Marius remained two years longer in Numidia, bringing the country into order, and establishing the Roman government there. While thus engaged, he was unanimously elected consul, and without opposition, the approach of the Teutones and Cimbri, and the Ambrones, who had destroyed several Roman armies, having caused great fear in Italy, and drawn all men's minds to the conclusion that power could be intrusted to no one but the conqueror of Numidia. His Jugurthine triumph took place Jan. 1, 104, the first day of

his second consulship. Jugurtha walked in the procession, and afterward was thrown into a dungeon and starved to death. The barbarians not appearing in Italy, Marius employed the time in effecting reforms in the army, and in disciplining the newly raised troops. His discipline was severe, but the impartiality of his conduct made him a favorite with the men, who had the utmost confidence in his ability and good fortune. He was chosen consul a 3d time for the year 103. The enemy still remaining in Spain, the aristocratical party determined to oppose his reelection; but the people supported him, and he was elevated a 4th time to the consulship. This year he encountered the Teutones and Ambrones in Gaul, totally destroying them in a great battle fought near Aquæ Sextiæ, the modern Aix. Just after the battle Marius received news that he had been elected consul for the 5th time. Meantime the Cimbri, who had separated from their allies, had penetrated into Italy, where the terror of their name caused the army of Catulus, the other consul, to fly before them. Marius was recalled to Rome. Refusing the triumph offered him by the senate until the Cimbri should be conquered, he joined the army of Catulus, with which the troops who had conquered the Teutones were now united. On July 30, 101, the Cimbri were annihilated in a pitched battle, fought on a plain called the Campus Raudius, near Vercellæ, the modern Vercelli. The victory was due to Marius, though his enemies sought to give the credit of it to Catulus, who was then proconsul; but the Romans were so convinced that they owed their deliverance to the consul, that among other high honors they gave him the title of third founder of the state, thus ranking him with Romulus and Camillus. His triumph was brilliant, and Catulus was allowed to share in it. For the 6th time he was chosen consul; but the good fortune which he had experienced in the field deserted him in the city, where his ignorance of civil life led him into various mistakes, which caused his popularity to decline as rapidly as it had risen. The aristocracy had the art to place him in opposition to the tribune Saturninus, who was his instrument and associate, and whom he had to proceed against to the tribune's ruin and death. He entrapped his old enemy Metellus, by a trick, into a position that caused him to be banished. So low had Marius sunk by the time his 6th consulship was drawing to a close, that he dared not become a candidate for the censorship. The next year, 99 B. C., he visited Asia, where he sought to rouse Mithridates to make war on Rome, being conscious that he should recover his popularity when once more placed at the head of an army. He was chosen augur during his absence. After his return to Rome, he did not rise in popular esteem; he could obtain no command in the East, and Sylla, who had supplanted him in the people's favor, exasperated him by his conduct. The Mauritanian king had set up in the capital figures showing the surrender of Jugurtha.

Sylla. Marius was making preparations to pull down these figures, and Sylla to resist him, when, in 90 B. C., the social war broke out, which threatened the subversion of the Roman power in Italy. Both Marius and Sylla had to contend against the confederate Italians in the social or Marsic war, and both did so with success. It was thought, however, that the exploits of Sylla were the more striking, but it is certain that Marius twice defeated the Marsi, the most warlike of all the allies, and whose name furnished to the Romans a title for the war. He returned to Rome after these victories, avowedly because of his inability to encounter the fatigues of the service. He had grown fat and unwieldy, and was 67 years old. After this war had been finished, the rivalry of Marius and Sylla was resumed. War against Mithridates having been commenced, Marius sought the command in the East. He frequented the Campus Martius, and went through exercises appropriate to the young, in order to show that he was equal to the fatigues of war. He failed, and Sylla was appointed to the office he sought (88). Marius now procured the passage of a law to distribute the Italian allies, who had been admitted to the Roman franchise, among all the tribes, so that they should control the old citizens. His tool was P. Sulpicius Rufus, a tribune, and he was successful, though not without having resort to violence. The Italians then conferred the eastern command upon Marius; but Sylla, who had joined the army destined to act against Mithridates, incited it to resistance, marched to Rome, and compelled Marius and his friends to fly, they having no force to send against him. Marius endeavored to raise an army by offering freedom to all slaves who should join him, but in vain. He then sought to reach Africa, but was compelled by the severity of the weather and want of provisions to land in Italy, near which he was coasting. Taking refuge in a wood, and suffering from cold and hunger, he predicted that he should yet receive a 7th consulship. He told his companions that in his childhood a nest with 7 eaglets in it had fallen into his lap, and that the soothsayers had prophesied to his parents that he should 7 times enjoy supreme power. Flying from immediate pursuit, he and his company were forced to swim to two merchant vessels, the crews of which refused to give them up, but afterward made them land at the mouth of the Liris. Here, while concealed in a thick marsh, Marius was found by his pursuers, and imprisoned at Minturnæ. A Cimbric soldier was ordered to despatch him, but lost courage, so affected was he by the majesty of the old man's appearance and language, and declared that he could not kill Caius Marius. The people of the town rose in his favor, and furnished him with a vessel, in which he sailed to Africa, meeting with many dangers on the way. He landed at Carthage, where a message was sent him by the Roman prætor, ordering him to save the country. His answer was: "Tell the

prætor that you have seen Caius Marius a fugitive sitting on the ruins of Carthage"—a reply, says Plutarch, in which he not inaptly compared the fate of that city and his own changed fortunes. He was soon compelled to leave, and went with his son to the island of Cercina. Meantime a revolution had taken place in Italy, where the consul Cinna, who was of the Marian party, had placed himself in opposition to the Syllan faction, headed by his colleague Octavius. The latter, after a severe struggle, expelled Cinna from Rome, who raised a large army, composed of the new citizens. Marius, on hearing of this, returned to Italy, and on landing proclaimed freedom to the slaves, and sent to Cinna, offering to obey him as consul. Cinna accepted the offer, and named him proconsul. This office Marius would not accept, saying its title and insignia were not suited to one in his state. One idea, that of vengeance, alone had possession of his mind. Rome was soon compelled to surrender to the army headed by Cinna and Marius. The former was disposed to proceed mildly, but Marius had other intentions. At first he refused to enter the city until the comitia repealed the law under which he had been banished; but while the voting for that purpose was going on, he entered at the head of his guards, who were composed of the slaves by whom he had been joined, and an immediate massacre of the anti-Marians was begun. The slaughter was continued for several days, and among its victims were many of the noblest of the Romans. Cinna and Marius declared themselves consuls for the next year, 86 B. C. But though Marius had thus irregularly obtained his 7th consulship, he did not long enjoy it, dying on its 17th day, but whether from illness brought on by age, fatigue, and care, aided by dread of the future, or by suicide, is unknown. The statement that his mind was disordered by fear of Sylla's return is probably one of the libels of the Syllan party. After the triumph of Sylla, the ashes of Marius were thrown into the Anio, by order of the victor. The representative and leader, though perhaps not in strictness the founder, of the party which bears his name in the later history of the Roman republic, and which he was clearly incompetent to conduct to success, his character has probably suffered, like that of other party chiefs, at the hands of his enemies. No Roman ever rendered greater services to the state, and no Roman ever rose so high, to fall so low, with the single exception of Pompey, who in the next generation headed the opposite party.

MARIVAUX, PIERRE CARLET DE CHAMBLAIN DE, a French author, born in Paris in 1688, died there, Feb. 16, 1763. He commenced his literary career by a series of travesties on the *Iliad*, La Fontaine's "Telemachus," and "Don Quixote," of which he subsequently professed himself ashamed; and going soon after into the opposite extreme, he produced a heavy tragedy, entitled the "Death of Hannibal." Finding his powers adapted neither to the sublime nor to

the grotesque, he attempted a new line of literature by writing pieces of intrigue for the stage. His comedies are chiefly remarkable for skilful analysis of human feelings, nice distinctions of character, and a kind of metaphysical subtlety in the development of passion and character. They number about 80, the greater part having been written for the Italian theatre, and were highly popular in their day, although now seldom performed. Among the best are *Le jeu de l'amour et du hasard*, the author's dramatic *chef d'œuvre*, and *Les fausses confidences*. He is now known chiefly by his romances, *La vie de Mariane*, and *Le paysan parvenu*, the former of which Jules Janin calls "an inexhaustible repertory of every form of wit and grace, of brilliant language, of delicate repartee, and of exquisite studies of human character." He also wrote *Le spectateur François* and *Le philosophe indigent*, distinguished like all his other works by an eccentric and affected style, called after him *marivaudage*, which has found many imitators in France. He was elected a member of the French academy in 1748, Voltaire being a rival candidate on the occasion.

MARJORAM (*origanum*, Linn.), the common name of a genus of plants in the natural order of *labiata*, having nearly entire leaves and purplish flowers crowded in cylindrical or oblong spikes, which are imbricated with colored bracts. Persoon enumerates 17 species; but the most common in the gardens is the sweet marjoram (*O. majorana*, Willd.), native of Barbary and the Himalaya mountains. It is a clean, pretty, low bushy plant, usually treated as an annual, but may be kept for several years by cultivation in pots or boxes during the winter time. The young and tender shoots readily take root and form abundance of new plants for the open border during the summer. The fragrant leaves and buds being carefully dried are pulverized by rubbing them in the hands, and are employed by cooks in the preparation of forced-meat balls or stuffing, imparting a pleasant seasoning to potted birds, roasted meats, or roasted fowls. The wild marjoram (*O. vulgare*, Linn.) has become sparingly naturalized in the United States, adventitiously introduced from Europe. It can be found occasionally upon dry banks and sunny slopes. Its flowers are very pretty, appearing in the months of July and August. The essential oil from the *origanum* has been employed to cure the toothache; it is said to be very powerful. For other medicinal preparations, as tonics and stomachics, it is seldom employed now, though once in some repute.

MARK ANTONY. See **ANTONY**.

MARK, SAINT, the Evangelist, according to the opinion of most theologians, identical with John Mark, mentioned in the Acts (xii. 12, 25). By comparing the passages of the New Testament relating to both Mark and John Mark, we learn the following facts of his life. He was the son of a certain Mary, who possessed a house at Jerusalem which served the Christians

as a place of refuge. About the time when James the Elder was executed, he left Jerusalem together with Paul, and Barnabas his cousin (A. D. 42), went with them to Antioch, and from there to Cyprus, but separated from them at Perga, in order to return to Jerusalem. Paul blamed this conduct; and when later Barnabas proposed to take Mark along on a new missionary tour, Paul objected, and Barnabas and Mark undertook a journey of their own. But we find him again as a friend and fellow laborer of Paul during the first captivity of the latter. It appears that both intended, after the end of the captivity, to visit the Christians of Asia Minor. Mark probably executed this design, for Paul requests Timothy (2 Tim. iv. 11) to bring Mark to Rome. He was with the apostle Peter, near Babylon (which, according to many interpreters, designates Rome), when that apostle wrote his first epistle. According to the testimony of the ancient church, Mark was in a particularly intimate relation to the apostle Peter, who employed him as secretary in the same way as Titus was employed by Paul. After the death of Peter, Mark is said to have gone to Egypt, and in particular to Alexandria, to have collected congregations in Alexandria and the neighborhood, to have been the first bishop of Alexandria, and, finally, to have suffered martyrdom there. He is the patron saint of Venice, which city claims to possess his body. His festival is celebrated in the Roman Catholic church on April 25.—The Gospel of Mark is distinguished from the three others by being more exclusively historical, and excluding longer didactic portions, such as the sermon on the mount. All the facts recorded in it may be found also in Matthew or Luke, and only 27 verses belong exclusively to Mark, a circumstance which has furnished to modern critics arguments for the most divergent, and sometimes most extravagant speculations. Some (as Eichhorn, De Wette, Schleiermacher, and Credner) have declared it a compilation from the Gospels of Matthew and Luke, in the arrangement of which the author was guided by the preaching and perhaps the advice of Peter; others, on the contrary, claim for the Gospel of Mark a priority in point of time. Many critics also assert that the Gospel in its primitive form no longer exists, and that we have in the canon of the New Testament a revised and enlarged edition of it. But this assertion is supported more by inference and speculation than by historical argument. The defenders of the originality of the Gospel of Mark in its present form generally place the time of its compilation between the death of the apostles Peter and Paul, and the destruction of Jerusalem. Rome is almost unanimously regarded as the place where it was written. The evangelist undoubtedly used the Greek language; a note to the Syrian translation, stating that the Gospel was compiled in Latin, received for a time wide currency among Roman Catholic scholars through the support of Baronius, but it has been almost entirely

discarded since the time of Richard Simon. Doubts are entertained also by prominent theologians of the orthodox school whether the last 13 verses are by Mark, or were added after his death; in support of the latter view it is adduced, that Jerome, Gregory of Nyssa, and other fathers expressly mention that the Gospel closed with the words: "For they were afraid" (xvi. 8); in favor of the other, that all the Latin and Syrian manuscripts have these verses.—For commentaries on Mark, see the collective works on the Gospels mentioned in the article LUKE. A commentary on Mark alone was published by J. A. Alexander (New York, 1858), and one on Matthew and Mark, by D. D. Whedon (New York, 1860). Accounts of the modern discussions about the origin and history of the Gospel of Mark may be found in Wilke, *Der Urevangelist* (Leipsic, 1838), and F. C. Baur, *Das Marcus Evangelium* (Tübingen, 1851).

MARL, a term commonly applied to soils consisting of sand, clay, and carbonate of lime, the last being in sufficient quantity to give a decided calcareous character to the mixture. In New Jersey the layers of greensand are very generally known as marl beds, a name more correctly applied to the tertiary beds made up of marine fossil shells which are found near the coast of the middle and southern states, and are employed for fertilizing the soil. In the northern states rich marl deposits are often found at the bottom of ponds, in the form of a thin white mud filled with minute fresh water shells of living species. (See GREENSAND.)

MARLBOROUGH, a N. E. district of S. C., bounded N. and N. E. by N. C., and S. W. by the Great Pedee, and drained by the Little Pedee and Crooked creek; area, 480 sq. m.; pop. in 1850, 10,789, of whom 5,600 were slaves; white pop. in 1859, 11,456. It has an undulating surface and fertile soil. The productions in 1850 were 351,670 bushels of Indian corn, 25,810 of sweet potatoes, 20,854 lbs. of rice, and 9,501 bales of cotton. There were 8 grist mills, 10 saw mills, 1 cotton factory, 20 churches, and 524 pupils attending public schools. Capital, Bennettsville.

MARLBOROUGH, DUKE OF. See CHURCHILL, JOHN.

MARLOWE, CHRISTOPHER, or KIT, an English dramatic poet, the greatest of the precursors of Shakespeare, born in Canterbury in 1564, killed in Deptford, June 16, 1593. His father, a shoemaker, succeeded in obtaining for him admission into King's school, Canterbury. He was afterward entered as a pensioner of Corpus Christi college, Cambridge, where he received the degree of bachelor of arts in 1583 and of master in 1587. In 1586 he produced the first part of his tragedy of "Tamburlaine," which exhibits more action on the stage, a more dramatic dialogue, and a far more varied and skilful versification, than any English play which had preceded it. It was ridiculed for its bombastic style and extravagant scenes, the hero "threatening the world with high astounding terms." It was

printed with a second part in 1590. His second play was the "Tragical History of the Life and Death of Dr. Faustus," a powerful though irregular drama, its poetical beauties being often intermingled with low buffooneries. The hero makes a pact with Lucifer, to whom he disposes of his soul on condition of having a familiar spirit and unlimited power at his command for 24 years. The awful melancholy of the fiend, as contrasted with the malignant mirth of Goethe's Mephistopheles, the struggles of awakened conscience in the hero, and the splendid horror of the termination, are its most striking features. The German puppet play constructed from this drama was the foundation of Goethe's great tragedy, which consequently in the opening has a striking resemblance to Marlowe's. The "Jew of Malta" has more vigorous passages than are to be found in any other Elizabethan play except those of Shakespeare. His "Edward II." contains a death scene which Charles Lamb says "moves pity and terror beyond any scene, ancient or modern." Several other plays of doubtful authorship have been attributed to him, and it is probable that the second and third parts of Henry VI. in Shakespeare were mostly written by Marlowe. He also made translations from Ovid, so licentious that the archbishop of Canterbury ordered them to be burned, yet they have been often reprinted. He is supposed to have been an actor as well as playwright, led a dissipated life, is stated to have held atheistical opinions, though there is no proof of this in his plays, and died from a wound received in a disgraceful quarrel. An edition of his works by Alexander Dyce was published in London in 1850, in 3 vols.

MARMONT, AUGUSTE FRÉDÉRIC LOUIS VIESSE DE, duke of Ragusa, a marshal of the French empire, born in Châtillon-sur-Seine, July 20, 1774, died in Venice, March 2, 1852. He was descended from an ancient family, and at 15 years of age entered a regiment of infantry as sub-lieutenant. Three years afterward he was transferred to the artillery; and having fallen under the notice of Bonaparte, he was in 1796 appointed his 1st aide-de-camp, in which capacity he served with distinction in the Italian campaigns of 1796-'7. He accompanied the expedition to Egypt, and for his good conduct at the investment of Malta, he was appointed a general of brigade. He returned with Bonaparte to France, and for his coöperation on the 18th Brumaire was appointed commander-in-chief of the artillery in the army of reserve. The successful transportation of the French artillery over the Great St. Bernard in the spring of 1800 was in a great measure due to his exertions; and the skill with which he managed his batteries at Marengo procured him the rank of general of division. He participated with credit in the campaign of 1805 in Germany, and in 1806 was made commander-in-chief of the forces in Dalmatia, where he remained until 1809. For his successful defence of Ra-

gusa against a greatly superior force of Russians and Montenegrins, Sept. 30, 1806, he subsequently received the title of duke of Ragusa. After the battle of Aspern and Essling (May 21, 22, 1809) he brought up his corps in good order to the assistance of the emperor, defeating on the way superior bodies of Austrians in several decisive encounters; and for his conduct at the battle of Wagram and in the subsequent pursuit of the enemy, he was created a marshal of the empire, on the same day with Macdonald and Oudinot. In 1811 he was sent to relieve Masséna in Portugal, where he ended a series of ill-advised and unfortunate movements by losing the decisive battle of Salamanca, which ruined the French cause in the Peninsula. Having recovered from a severe wound received on this occasion, he joined the emperor in Germany in 1813, and fought at Lützen, Bautzen, Dresden, and Leipzig, with a valor which in some degree retrieved his military reputation. In the campaign of 1814 he vigorously coöperated with Napoleon in the brilliant but useless series of battles in which the advance of the allies was sought to be stayed, and on March 29 arrived with the remnant of his corps before Paris. At the battle of Paris, fought on the succeeding day, he showed the utmost intrepidity and devotion to the imperial cause, and, with the few thousand men comprising his own corps and that of Marshal Mortier, withstood for many hours the attacks of an army four times as numerous. An armistice was finally agreed upon, and late in the day Marmont, availing himself of a letter from Joseph Bonaparte, who had been appointed lieutenant-general of the empire, authorizing him to enter into an arrangement with the allied sovereigns, agreed to evacuate the city. On the 31st the allies entered Paris in triumph; and 4 days afterward Marmont, influenced by a *senatus consultum* declaring Napoleon's forfeiture of the throne, and abolishing the right of succession of his family, gave in his adhesion to the provisional government which had been formed under the presidency of Talleyrand; stipulating, however, that the life and personal freedom of Napoleon should be secured, and that the French troops should be provided with secure quarters in Normandy. On April 5 his corps, numbering 12,000 men, accordingly entered within the allied lines and took the road to Normandy. The indignation of Napoleon at this proceeding was boundless, and, in an order issued from Fontainebleau immediately after the news reached him, he expressly disavowed it, observing: "The emperor cannot approve the condition on which the duke of Ragusa has taken this step; he cannot accept life and liberty at the mercy of a subject." During the Hundred Days he expressly excepted him from the imperial act of amnesty, and subsequently at St. Helena, speaking of his defection, said: "I was betrayed by Marmont, whom I might call my son, my offspring, my own work; by him to whom I had committed

my destiny, by sending him to Paris at the very moment he was putting the finishing stroke to his treason and my ruin. . . . Marmont will be an object of horror to posterity. As long as France exists his name will not be mentioned without a shudder." He received numerous distinctions from the Bourbons after the first and second restorations, but about 1825 retired to his country seat, whence, in July, 1830, he was suddenly summoned to Paris to quell the revolt against Charles X. Failing in this, he was obliged to share the exile of the king; and so strong was the odium excited against him, that his name was struck from the list of the French army. He never reëntered France, but wandered over Europe, fixing his residence finally at Venice, where his latter years were passed. He published his travels in Hungary, southern Russia, Syria, Egypt, &c., and *Esprit des institutions militaires*, which Marshal Bugeaud wished to place in the hands of every officer in the service; and left an autobiography, published in Paris under the title of *Mémoires du duc de Raguse* (9 vols. 8vo., 1856).

MARMONTEL, JEAN FRANÇOIS, a French author, born in Bord, Limousin, in 1723, died at Abbeville, near Evreux, Dec. 31, 1799. Of humble birth, he was educated gratuitously under the Jesuits of Mauriac, and was intended for the priesthood. His love of literature prevented this career, and also withdrew him from commerce, in which his father sought his establishment, and he became professor of philosophy at Toulouse, where his verses took the prize of the *jeux floraux*. Voltaire, with whom he began a correspondence, induced him to remove to Paris in 1745, where he quickly obtained the prize of the French academy for a poem, and produced several tragedies which the genius of Mlle. Clairon made eminently successful on the stage. Protected by Mme. de Pompadour, he became in 1753 historiographer of the royal buildings, and in 1754 publisher of the *Mercur de France*, and thus had a large income. To the *Mercur* he contributed the *Contes moraux*, on which his fame chiefly rests, and which have been greatly admired as specimens of light and lively writing. His position as manager of the *Mercur* was lost after two years in consequence of a satire on the duke d'Aumont, and he was confined for a few days in the Bastille. Admitted into the academy in 1763, he succeeded D'Alembert in 1783 as perpetual secretary. He left Paris during the revolution, was one of the moderate deputies in the *conseil des anciens* in 1797, and lived again in retirement after the 18th Fructidor. His best theatrical pieces are the tragedies *Les Héraclides* and *Numitor*, the operas *Didon* and *Pénélope*, and the comic operas *Sylvain* and *Zémire et Azore*. He also wrote the romances *Bélisaire* (1767) and *Les Incas* (1777), collected his articles in the *Encyclopédie* under the title of *Éléments de littérature* (6 vols., 1787), published a history of the regency of the duke of Orleans, and left trea-

tises, designed for the education of his children, on the French language, logic, metaphysics, and morals, and his own *Mémoires* (4 vols., 1804). A complete edition of his works was published in 18 vols. (1808), and a select edition in 10 vols. (1824).

MARMORA, SEA OF (anc. *Propontis*), a body of water lying between European and Asiatic Turkey, 172 m. long, and about 55 m. wide. Its N. E. extremity is connected with the Black sea by the Bosphorus, and its S. W. extremity with the archipelago by the Dardanelles. It is remarkable for its depth, which in some places is over 350 fathoms. It has numerous excellent harbors on its N. shore, contains several islands, the principal of which is Marmora, and receives the waters of many but inconsiderable tributary streams. It has no tides, but a current of variable strength and velocity runs through it from the Euxine to the archipelago. Its shores present a picturesque aspect, and are especially bold and precipitous on the Asiatic side.—The ISLAND OF MARMORA (anc. *Proconnesus*; Turk. *Marmar Adası*), which gives name to the above sea, is about 45 m. in circumference, and for the most part mountainous and barren. It has been celebrated from a remote age for its marble (whence its name, from Lat. *marmor*), with which in ancient times it supplied Cyzicus and other Hellenic cities, as in modern times it has supplied Constantinople. The capital, Marmora, stands on the S. W. coast, and is chiefly built of wood. The highest summit of the island is in lat. 40° 36' N., long. 27° 35' E.

MARMOSET, the common name of the South American monkeys of the family *hapalidae*, including the genera *hapale* (Illiger) and *midas* (Geoffroy). The number of teeth is the same as in the old world apes and in man, viz.: incisors $\frac{1}{1}$, canines $\frac{1}{1}$, and molars $\frac{3}{3}$, with acute tubercles. They are all of small size, resembling squirrels in form and agility; the rounded head is frequently furnished with ear-like tufts of silky hair on the sides; the feet are 5-toed, the posterior having an opposable thumb with a flat nail, all the other fingers of both extremities having sharp claws, with the anterior thumb scarcely opposable; the tail is long and bushy, but not prehensile, and the body is covered with soft woolly fur.—In *hapale* the muzzle is short; the facial angle 50°; the upper lateral incisors insulated, the lower the longest, narrow, and convex outward; lower canines smallest. The striated marmoset or onistiti (*H. jacchus*, Ill.) is about 8 inches long, and the tail about a foot; the general color is a deep gray, with the lower back and tail banded with brown, head chestnut, spot on forehead and long hairs on cheeks and behind the ears white. It is a handsome and cleanly animal, walking on all fours, and like the rest of its family lives in the woods of Brazil, running about in the trees in pursuit of insects, fruits, small birds, and eggs; it is easily tamed, and makes an interesting and affectionate pet; in captivity it will eat almost any vegetable or animal food;

it is not so intelligent as the other monkeys; it breeds occasionally in confinement.—In *midas* the lower incisors are short and broad, and the forehead more prominent; the species are commonly called tamarins, and include some of the smallest and prettiest monkeys. The silky marmoset (*M. rosalia*, Geoffr.) is of a golden yellow color, sometimes with a reddish tinge, the fur being very soft and silky and forming a kind of mane upon the neck; its disposition is gentle, but its constitution is so delicate that it soon dies from the exposure of even temperate climates. The leonine marmoset or leoncito (*M. leoninus*, Geoffr.) is the smallest monkey known; the color is brownish with black face and brown mane, which it erects when angry, whence its name.

MARMOT, a large rodent of the squirrel family, and genus *arctomys* (Schreber). The body is thick and compressed, the head large and flattened, the legs short and stout, and the tail short, bushy, and nearly cylindrical; the incisors are less compressed than in the squirrels, smooth in front and rounded; the molars are $\frac{1}{1}$, enamelled continuously, with transverse pointed tubercles, the first upper one the smallest; the ears are short and rounded, but distinct above the fur; the fore feet with 4 toes armed with sharp claws, and a very rudimentary thumb with a small flat nail instead of a claw; the hind feet 5-toed, with strong curved claws; the soles are entirely naked; there are very shallow cheek pouches. The common European marmot (*A. marmota*, Schreb.) is 18 inches long, the tail 2½ inches; the color is yellowish gray, with the top of the head dark gray, russet at the base of the tail, and incisors yellow. The form is clumsy, the movements slow, and the sagacity small; inhabiting the mountains of Europe near the snow line, they live in families in burrows, in which they pass the winter in a state of lethargy; the food is vegetable, during the search for which one animal is stationed as a sentinel near the burrow, into which all retreat at the signal of danger; the circular chamber for the family is approached by a narrow gallery 5 or 6 feet long; they hibernate on beds of dried grass, and are very fat at the beginning and very lean at the end of this season; when fat they are sometimes used by the mountaineers as food. The Poland marmot (*A. bobac*, Pall.) is sometimes larger, with more reddish tints. They burrow in the plains of less elevated districts in Poland, Russia, and northern Asia; they prefer dry and stony soils, into which they dig very deeply, living in families of 30 or 40, and amassing large quantities of dried grasses. Other marmots are described, which occasionally, as perhaps do all, feed upon birds and small quadrupeds. The American marmot (*A. monax*, Gmel.) will be noticed under **WOODCHUCK**, its common name. Many animals of the allied genus *spermophilus* (Cuv.) are sometimes called marmots, but such come more properly under the head of prairie squirrels. The fur is thick and not very coarse, and is considerably used for common caps, robes, and similar objects.

MARNE, a N. E. department of France, in the old province of Champagne, bounded N. by Aisne and Ardennes, E. by Meuse and Haute-Marne, S. by Aube, and W. by Seine-et-Marne and Aisne; area, about 8,000 sq. m.; pop. in 1856, 372,050. The surface is an inclined plane, sloping from E. to W., and diversified by a few hills of moderate elevation. It is divided into 2 nearly equal parts by the river Marne, whence it derives its name. The land adjoining this river is rich, but the soil elsewhere is in general light and barren. The principal rivers, beside the Marne, are the Aisne, Suippe, and Vesle, in the N. and N. W., and the Aube and Seine in the S. The wine annually made amounts to over 15,000,000 gallons, mostly champagne. The most important manufacture is that of wool, which centres chiefly at Rheims. Capital, Châlons-sur-Marne.—**MARNE** (anc. *Matrona*), a river of France which rises in the department of Haute-Marne, and, after a N. W. course of about 280 m., falls into the Seine near Paris. Its principal tributaries are the Ornain, Blaise, Petit-Morin, and Grand-Morin. The chief cities on its banks are Langres, Chaumont, Joinville, St. Dizier, Vitry-le-François, Châlons, Epernay, and Meaux. It is navigable from its junction with the Seine to St. Dizier, 210 m. The Marne is connected with the Rhine and Aisne by means of canals.

MARNE, HAUTE. See **HAUTE-MARNE**.

MARONITES, the name of a body of Christians in Asiatic Turkey, who recognize the supreme authority of the pope, and therefore form a part of the Roman Catholic church. They chiefly inhabit Mt. Lebanon, its declivities and valleys, between Tripolis (Tarabulus), Tyre, and the lake of Gennesareth. In smaller numbers they are also found in Aleppo, Damascus, and several other places in Syria, and in the islands of Cyprus. Their chief seat is in the district of Kesrawan, which is inhabited almost exclusively by Maronites, while everywhere else they live mixed with Jacobites, Greeks, Druses, and others. The *Notizia statistica delle missioni Cattoliche* (Rome, 1843, p. 170) gives their number as about 500,000, but according to other authorities it does not amount to more than about 150,000. They were originally Syrians, and still use the old Syrian language in their worship; but their conversational language at present is the Arabic. They enjoy a kind of political independence, being governed by native sheiks who only pay an annual tribute to the Ottoman sultan. The supreme government is in the hands of 4 chief sheiks, who are also their leaders in war. As they are accustomed to go armed, from 30,000 to 40,000 men are always ready to march. Formerly they lived in peace with their neighbors, the Druses, but in 1841 a national war commenced between the two tribes, from which especially the Maronites suffered greatly. In May, 1860, the war with the Druses broke out with new and unprecedented fierceness. The Druses, aided by the sympathy of the Mohammedan population and even of the Turkish troops, very soon over-

powered the Maronites, and sought to exterminate every thing Christian in Syria. About 160 towns and villages were burned, nearly the entire Maronite territory laid waste, more than 10,000 men slaughtered, 25,000 Christian women sold to the Turkish harems, and the rest of the population made beggars. The massacre at Sidon and other places was of unparalleled cruelty. On July 10, the entire Christian quarter of Damascus was sacked, and the population for a great part massacred; but, contrary to general expectation, two days later a treaty of peace was concluded. To prevent the return of similar atrocities, the European powers, at a conference held in Paris, agreed, on Aug. 8, upon an intervention in Syria for the protection of the Christians. (See **SYRIA**.)—The derivation of their name, and the time when their independent ecclesiastical organization commenced, have not yet been established with entire certainty. The prevailing opinion is that they were called either after a hermit, Maro, who lived in the 5th century, or after their first patriarch, John Maro, who lived two centuries later. The Maronite writers, as Abraham Ecchellensis (1651), Nagron (1679), Assemani, and more recently Murad (*Notice historique sur l'origine de la nation Maronite*, Paris, 1844), maintain that the Maronites always professed the orthodox faith; and a few Roman Catholic writers have supported this view. But most historians, Catholics (Baronius, Renandot, Le Quien, Richard Simon, and others) as well as Protestants, are of opinion that the Maronites were Monothelites until 1182, when their patriarch with several bishops entered into a union with the Roman Catholic church. A permanent union of the Maronite nation with Rome was effected in 1445. In 1584 Pope Gregory XIII. founded in Rome a Maronite college, from which they have since received most of their priests. Clement XII. in 1736 prevailed on a national synod to accept the resolutions of the council of Trent. The popes have permitted the Maronites, as well as the other oriental sects which have accepted a union, to retain a number of old traditional usages; thus they receive the Lord's supper in both kinds, their priests are allowed to marry, &c. Their liturgy they derive from Ephraim Syrus. As a church they are governed by a patriarch, who lives in the convent Dair al Shafee on Mt. Lebanon, and always bears the name Peter and the title patriarch of Antioch. Every 10th year he has to give an account of the condition of the church to the pope. The Roman almanac mentions moreover an archbishopric and 6 bishoprics. (See Schem's "Ecclesiastical Year Book," New York, 1859, p. 33.) Several bishops also reside with the patriarch. The number of congregations is about 150. Convents were formerly very numerous; in the district of Kesrawan alone more than 200 were counted with about 20,000 members, all following the rule of St. Anthony; but in consequence of the recent wars with the Druses many convents have perished.

MAROONS, fugitive slaves in the European colonies in the West Indies and in Guiana, who have banded together in the forests and mountains and maintained their freedom. The origin of the word is uncertain, it being derived, according to one etymology, from the Spanish *marrano*, "wild hog," these fugitives subsisting at first chiefly by hunting that animal; according to another, from *simaran* or *cimanon*, which signifies both an ape and a wild man; and by still a third derivation, from Marony, a river which separates French from Dutch Guiana, where large numbers of them resided. They are particularly celebrated in the history of Jamaica. On the conquest of that island from the Spaniards by the English in 1655, most of the Spanish slaves, about 1,500 in number, fled to the mountains, whence they kept up a guerrilla warfare against the whites. They became so troublesome that in 1668 the governor, Sir Charles Lyttleton, issued a proclamation offering pardon, freedom, and 20 acres of land to such as should surrender; but it does not appear that any of them accepted the terms offered. Their numbers enlarged by natural increase and by accessions of other fugitives from slavery; and the colonial assembly in the course of 40 years passed 44 acts against them, and expended £240,000 in vain efforts for their subjugation. In 1730 they were grown so formidable, under a very able general named Cudjoe, that all the militia of the colony and two regiments of regular troops were sent against them. But after 7 years' war they were still unsubdued, and in 1737 the colonial assembly imported Indians and bloodhounds from Spanish America to aid in their suppression. Even these failed, however, and at length the royal governor Trelawny made overtures of peace to the black chiefs; and on March 1, 1738, the Maroons agreed to a treaty which provided: "First, that all hostilities shall cease on both sides for ever; secondly, that the said Captain Cudjoe, the rest of his captains, adherents, and men, shall be for ever hereafter in a perfect state of freedom and liberty; thirdly, that they shall enjoy and possess, for themselves and posterity for ever, all the land situated and lying between Trelawnytown and the Cockpits, to the amount of 1,500 acres." Beside the arable land thus given them for cultivation, the Maroons had for their hunting grounds the whole mountainous interior of the island. Their game was the wild boar, which abounds in the mountains. They had a method of curing the flesh without salting it, and they sold large quantities of it to the whites, and by this traffic kept themselves well supplied with firearms and ammunition. There were no hostilities between them and the whites for many years, until in July, 1795, a portion of them known as the Trelawnytown Maroons rose in insurrection in consequence of two of their young men having been publicly whipped by the authorities for stealing. Their rising created so much alarm that the island was put under martial law, although the government

had a force of 1,500 regular troops and several thousand militia. The earl of Balcarres, the governor of Jamaica, marched against them in August with a large body of troops, but was defeated and driven back with considerable loss. In the war that ensued the Maroons at first met with much success, until Gen. Walpole by great efforts brought them to be willing to listen to overtures of peace. About 600 of them surrendered on assurances of liberty and good treatment, but were perfidiously placed in confinement, and on June 6, 1796, shipped from the island and sent to Nova Scotia, whence in 1800 they were again transported to Sierra Leone. Those who remained in Jamaica maintained their independence; but since the abolition of slavery in the island they have to a great extent intermingled with the mass of the colored population. In 1835 it was officially reported that in 4 of their settlements in Jamaica there were 270 families, or about 1,500 persons.—In the Dutch colony of Surinam, in South America, a band of Maroons was formed at a very early period of the colony in the forests of the interior, but they did not become formidable till about 1726, when they had acquired by pillage lances and firearms. They settled on the upper part of the river Seramica, and were consequently soon known as Seramica negroes. Several detachments of soldiers and militia having been sent against them without much success, the authorities in 1730 undertook to terrify them into submission by executing 11 of them who had been taken prisoners. One man was hanged alive by an iron hook stuck through his ribs, two others were burned alive, 6 women were broken upon the wheel, and 2 girls were beheaded. These cruelties, however, only enraged the Maroons, and their incursions became so troublesome to the colonists that the government at length resorted to negotiation, and a treaty of peace was formally concluded in 1749, between the governor of Surinam and the Maroon chief, Captain Adoe. From some misunderstanding between the parties, this truce was not of long continuance, and fresh revolts broke out among the slaves on the Ouca river, so that in a few years the colony was reduced to the greatest distress by their incursions; and in 1757, after being defeated by the negroes in several encounters, the Dutch again sued for peace. After a long negotiation and 4 different embassies from the Europeans, a treaty was concluded in 1761, by which the Ouca and Seramica Maroons were admitted to be free and independent, and the colony agreed to pay them an annual allowance to secure their friendship. After some years a revolt occurred among the negroes on the Cottica river, which gained such force in 1772 that the colonists were forced to abandon their plantations and take refuge in Paramaribo until assistance arrived from Holland. A force of 1,200 Dutch troops, assisted by several hundred negroes liberated and armed for the purpose, at length drove the Maroons back to the woods. With additional troops

from Holland a systematic attempt was now made to subdue the Maroons, but without success; and at the end of a war which lasted several years the colonial government withdrew from the contest. The Maroons at that time were about 15,000 in number. In 1831 they had increased to 70,000, and at present they are still more numerous. They form an independent republic, with laws and customs of their own. Christianity has made little progress among them, and their language is a jargon of African and European tongues intermingled.—For an account of the Maroons of Jamaica, see Bryan Edwards, "History of the West Indies," and Dallas, "History of the Maroons;" and for the Maroons of Surinam, see Stedman's "Surinam." MAROS, the most important river of Transylvania, rising near the E. frontier, flows N. W., S. W., and finally W., enters Hungary, and after a course of about 400 m. falls into the Theiss near Szegedin. Its principal affluents are the two Kokels in Transylvania, in which country its banks offer much picturesque scenery. The chief towns on its banks are, in Transylvania, Saxon-Regen, Maros-Vásárhely, the principal town of the Szeklera, and the fortress Carlsburg; and in Hungary, Ménes, Arad, and Makó. During the revolutionary war of 1848-'9 the Maros formed a strategical line of great importance. It now forms the N. boundary of the Voivodina and Banat, which have since been detached from Hungary.

MAROT, CLÉMENT, a French poet, born in Cahors in 1495, died in Turin in Sept. 1544. His father, Jean Marot, was also a poet, valet de chambre to Francis I., and, like the son in after life, noted for his irregularities. Clément first became page to the sieur de Villeroy, and subsequently to Margaret, duchess of Alençon, and sister of the king, whose husband he followed to the army in 1521, on the breaking out of the war with Charles V. On the death of his father he succeeded him as valet de chambre to Francis I., accompanied him to Italy, and was wounded and made prisoner at the battle of Pavia in 1525. On recovering his liberty and returning to Paris, he was accused of heresy and cast into prison, at the instigation, as has been stated, of Diana of Poitiers. The king, on his return from captivity in Spain, ordered his release, as he did again a year later when he was imprisoned for a misdemeanor. In 1535, the charge of heresy being revived, he retired to the court of Margaret, now become queen of Navarre, and went thence to Ferrara and Venice. In 1536 he returned to Paris, having abjured the heretical doctrines at Lyons. His metrical translations of the Psalms, which were very popular, and were sung by the king and the whole court, being condemned as heretical by the Sorbonne, he again fled in 1543 to Geneva, where he added 20 Psalms to the 80 previously published. He then went to Turin,

where he died in great poverty. His poems consist of epistles, rondeaux, ballads, epigrams, &c. His most important longer productions, beside the translations of the Psalms, were *L'enfer*, a satire upon the lawyers, and a new version of the *Roman de la rose*. His son Michel was also a poet, though much inferior to himself; and a complete edition of the works of the three Marots was published at the Hague in 1731, in 3 vols. 4to. The works of Olément Marot have been frequently reprinted.

MARQUESAS ISLANDS, or MENDANA ARCHIPELAGO, a cluster of 18 small islands in the South Pacific ocean, between lat. 8° and 11° S. and long. 138° 30' and 143° W.; aggregate area, 1,800 sq. m.; pop. about 25,000. They are generally divided into a southern group (Hiwaoa, Tahuata, Motane, and Tiboa), which was discovered in 1596 by the Spaniard Mendoza de Neyva, and by him named Las Marquesas de Mendoza in honor of the viceroy of Peru, the marquis de Mendoza; and a northern group, discovered by Captains Marchand and Ingraham (1791). Among the latter, the islands of Nukahiva, Huahuna or Washington island, Huapu or Adams island, Shotomiti or Franklin island, and Futu-uhu are the largest. They are of volcanic origin, a fact which is attested by long rows of bleak basaltic rocks. Each island is formed by a mountain ridge, which rises to an elevation of 2,000 or 3,000 feet, sending forth numerous lesser chains, between which fertile valleys open toward the ocean. The coast is for the most part rugged and precipitous, and the roadsteads being unprotected furnish no safe anchorage. The climate and productions resemble those of the other volcanic islands of subtropical Polynesia. The rainy season lasts from November to April. Droughts are not unfrequent during the hot season; Krusenstern mentions one which lasted for 10 months. The valleys, the soil of which is formed by hundreds of layers of decayed vegetation, are extremely fertile, and produce all tropical fruits in abundance. The yam, sugar cane, banana, plantain, taro, sweet potato, cotton plant, &c., grow almost without culture. The hillsides are covered with forests of cocoanut, breadfruit, and papaw trees, the fan palm, and numerous other trees; but the vigorous growth of underbrush renders them almost inaccessible. The fauna of the islands is as poor as their flora is rich. There are no indigerous mammalia, but swine, rats, and cats have been introduced from Europe. Of birds there are only 4 or 5 distinct species; among them the kurukuru and the gupil, a parrot of the size of the robin, are the most beautiful. Water fowl abound on the coast; and valuable mussels are found near the shore.—The inhabitants belong to the Malay race, and are distinguished by grace and symmetry of person. Their complexion is of a light copper color; the women appear almost white, but this complexion is produced by the application of the root of the papaw tree. Tattooing

is practised by both sexes. Their social organization is similar to that which prevailed in the Sandwich islands before the introduction of Christianity. They are divided into many tribes or clans, among whom bloody wars are of frequent occurrence. The "taboo" serves them instead of religion. The tabooed or privileged classes consist of *atnas*, who are venerated as superior beings; *tanas*, soothsayers and "medicine men;" *tataunas*, priests and surgeons; *whus*, the lowest rank of the hierarchy; *katai-his*, secular rulers; and *toas*, war chiefs. The non-tabooed classes are the *peto pekeios*, servants of the chiefs; *averias*, fishermen; *hokis*, singers and dancers; and *nohuas*, common laborers. The last named class hold a similar position to that of the pariahs in India. Among the peculiar social institutions of the islanders is polyandry, the woman choosing her husband or husbands, and retaining them or not according to her pleasure. Cannibalism is also practised sometimes, but simply as an act of vengeance; it is only the bodies of slain enemies of which, now and then, a slice is eaten. Their ordinary food consists principally of vegetables. A highly intoxicating beverage is prepared by chewing the root of the kanoa plant (*piper metisticum*), mixing it well with saliva, and then spitting it into a vessel, in which it is perfected by fermentation. The extensive use of this beverage produces leprosy or consumption. Beside these diseases, elephantiasis, scrofula, liver complaints, inflammation of the lungs, and diseases of the eyes, often resulting in blindness, are common among the islanders. Their scanty clothing is obtained from the mulberry tree, the bark of which they render thin and soft by beating, thus forming a kind of coarse cloth. Their habitations, small log huts thatched with leaves of the cocoanut tree, are erected on stone platforms from 3 to 5 feet above the ground. In similar houses they bury their dead.—These islanders have no history. Even the first discovery of the islands by Europeans has been entirely forgotten, though the Spaniards, who introduced swine, and also Cook and Marchand, are still venerated as gods. The Marquesas islands were taken possession of by Admiral Dupetit-Thouars, by authority of the French government, June 25, 1842. The inhabitants afterward made some unsuccessful attempts at reconquering their liberty. Under Napoleon III. the island of Nukahiva has been made a penal colony for political convicts.—See the voyages of Cook, Krusenstern, and Langsdorf.

MARQUETTE. I. A central co. of the upper peninsula of Mich., bounded S. W. by Wisconsin and N. E. by Lake Superior, and intersected by the Michigamig river; area, 8,900 sq. m.; pop. in 1850, 136. The surface is diversified, covered by extensive pine forests, and the soil fertile. It contains granite, limestone, and iron ore. Capital, Marquette. II. A central co. of Wis., intersected by the Neenah or Fox river; area, 864 sq. m.; pop. in 1855,

14,880. It contains Buffalo, Puckawa, and Green lakes. The surface is diversified and the soil good. The productions in 1850 were 85,614 bushels of wheat, 43,052 of Indian corn, 66,197 of oats, and 86,724 of potatoes. There were 2 grist mills, 5 saw mills, and 298 pupils attending public schools. Value of real and personal estate in 1855, \$2,189,087. Capital, Marquette.

MARQUETTE, JACQUES, one of the first explorers of the Mississippi river, born in Laon, France, in 1637, died May 18, 1675. At the age of 17 he entered the society of Jesus, and in 1666 sailed for Canada as a missionary. He spent about 18 months in the vicinity of Three Rivers, where he acquired the Montagnais and Algonquin languages, and in April, 1668, went to Lake Superior and there founded the mission of Sault Ste. Marie. In the following year he was sent to take the place of Father Allouez among the Ottawas and Hurons at Lapointe; but his stay here was short, these tribes being soon dispersed by the Sioux. Marquette then followed the Hurons to Mackinaw, and there in 1671 built a chapel at the mission of St. Ignatius, or Michilimackinac. In the following year he wrote of his success at Mackinaw to Father Dablon, the superior of the Jesuit missions in Canada. "I am ready, however," he continued, "to leave it in the hands of another missionary to go on your order to seek new nations toward the South sea who are still unknown to us, and to teach them of our great God whom they have hitherto not known." As early as 1669 in fact he had resolved upon exploring the Mississippi, of which he had heard from the Indians, and had made preparations at Lapointe to visit "this river and the nations that dwell upon it, in order to open the passage to so many of our fathers who have so long awaited this happiness." His desire was not gratified however until 1673, when Frontenac and Talon, the governor and intendant of Canada, having resolved to send an expedition under Louis Jolliet to explore the direction and mouth of the Mississippi, Marquette was instructed to accompany the party as missionary. With 5 other Frenchmen they left Mackinaw in 2 canoes on May 17, and reaching the Wisconsin river by way of Green bay, Fox river, and a portage, floated down to the Mississippi, on whose waters they found themselves by the 17th of June. On the 25th they stopped at an Indian village, where they were kindly received. Somewhere near the mouth of the Ohio, then called the Ouaboukigou, from which was formed its subsequent name of the Wabash, they met savages who assured them that it was not more than 10 days' journey to the sea, and that they bought stuffs and other articles of Europeans on the E. side. Continuing their voyage, they arrived at a village called Akamsea, probably about the mouth of the Arkansas. Here they held a council, and having satisfied themselves that they were not more than 2 or 3 days' journey from the mouth of the river, which undoubtedly emptied into the gulf of Mexico or

off the Florida coast, and not, as had been conjectured, in California or Virginia, they resolved to return, especially as their further progress would expose them to the danger of a captivity among the Spaniards. They began their homeward voyage on July 17, and, passing up the Illinois instead of the Wisconsin, arrived in September at Green bay. They had accomplished the object of their mission, and travelled in their open canoes a distance of over 2,500 miles. On the banks of the Illinois Marquette had promised the Kaskaskia Indians to return and preach to them. He was detained by sickness at the mission of St. Francis Xavier on Green bay a full year; but in Oct. 1674, having previously sent to his superiors an account of his journey down the Mississippi, he set out with two white men and a number of savages for the village of Kaskaskia. On Dec. 14 he was stopped at the portage on the Chicago by infirmities and severe cold, and dismissing the Indians resolved to winter there with his two companions. Resuming his journey, March 30, 1675, he reached Kaskaskia April 8, and at once began a mission by erecting an altar and celebrating the festival of Easter; but, conscious that his end was approaching, he soon attempted to return to Mackinaw. He reached no further than a small river whose mouth is on the E. shore of Lake Michigan, and which still bears his name, and there he died in the presence of the two Frenchmen who had attended him from Green bay. He was buried on the spot, but in 1677 his remains were carried to Mackinaw. The narrative of his voyage on the Mississippi was not published until 1681, when it appeared at Paris in Thèvenot's *Recueil de voyages*, accompanied by a map. This narrative, as well as a journal of the missionary's last expedition, and his autograph map, may be found in Shea's "Discovery and Exploration of the Mississippi Valley" (New York, 1852). His narrative, for some years after its first publication, was regarded as a fable; but his claim is now established as the first explorer of the great river of the West, and the first European who saw it after De Soto.

MARQUIS, or MARQUESS, a title of dignity in England, France, and Italy, ranking next below that of duke. In Germany, whence it derives its origin, the corresponding title is *Markgraf*, in English margrave or lord of the marches; and the persons so called or created were originally military chieftains to whom was committed the guardianship of the marches or frontiers of a kingdom. Hence the barbarous Latin word *marchio*. In continental Europe the *marchiones*, from being mere life occupants of their office, became at a comparatively early period territorial potentates, transmitting their titles and possessions, until they were established as a powerful hereditary order of nobility. In England the lords or wardens of the marches were originally barons or earls, whose office it was to preserve the frontier (as on the borders of Wales or Scotland) free from the inroads of

the enemy. The office was regarded for many centuries as a special or temporary one, and the term *marquis*, as distinguished from other titles of honor, was unknown until 1385, when Richard II. created his favorite Robert de Vere, earl of Oxford, marquis of Dublin for life, and gave him precedence between the degrees of earl and duke. The next creation was that of John de Beaufort, earl of Somerset, who was in 1397 made marquis of Dorset, and who, after being degraded in parliament, where he was only considered as earl of Somerset, declined to have the new honor restored to him, on the ground that "the name of marquis was a strange one in the kingdom." Such seems to have been the prejudice existing against the title, that it was not again conferred until 40 years afterward, in the reign of Henry VI. Thenceforth it continued to be occasionally bestowed, but was scarcely ever borne by more than 8 or 4 persons at a time until the latter half of the reign of George III., when the number of marquises was made equal to that of the dukes. Both in England and on the continent the title is now simply one of nobility, conferring upon the possessor no territorial rights or military command. Napoleon I. neglected to make use of it in establishing his new orders of nobility; but upon the restoration of the Bourbons it was readopted, and many counts of the empire were made marquises. In the British peerage the number of marquises is 37, of whom 4 bear Scottish and 12 Irish titles.

MARRACCI, LUDOVICO, an Italian orientalist, born in Lucca in 1612, died in Rome in 1700. He devoted himself from his youth to the study of languages, became a proficient in Greek, Hebrew, Syriac, Chaldean, and Arabic, and was appointed professor of Arabic in the college della Sapienza at Rome. Pope Innocent XI. highly esteemed him, chose him as his confessor, and would have advanced him to ecclesiastical dignities had not the modesty of Marracci declined them. His greatest work is his edition of the Koran in the original Arabic, with a Latin translation (Padua, 1698).

MARRAST, ARMAND, a French journalist and politician, born at St. Gaudens in 1800, died in Paris, March 11, 1852. After filling for 10 years the position of teacher in the college of Orthez and in that of Louis le Grand at Paris he became a journalist, and attracted attention by a political pamphlet, and by his attacks on the eclectic school of philosophy represented by Cousin. After the revolution of July, 1830, he became one of the editors of the *Tribune* newspaper, the organ of the extreme republicans, he was noted for the violence of his attacks upon the new government. The latter retaliated by imposing fines and imprisonment; and in 1831 Marrast, who had been arrested on a charge of complicity in various insurrections, escaped to England, where he acted as a correspondent of the *National*, then under the control of Armand Carrel. He now married a woman of fortune, and on the general amnesty of 1837 returned to France. He became the successor of Carr

an editor in chief of the *National*, which continued to be the leading organ of the French liberals. After the revolution of Feb. 1848, upon the formation of the provisional government, he was appointed mayor of Paris. Subsequently he was returned to the constituent assembly by 8 different departments, and was elected its president, an office which he filled by successive elections for several months. His views, however, being deemed too conservative, he became unpopular, and in the election of members of the legislative assembly not a single constituency in France put him in nomination. He continued to contribute to the columns of the *National* until its suppression by Louis Napoleon, and died in comparative obscurity.

MARRIAGE, in law, the conjugal union of one man with one woman. In all Christian communities the marriage relation exists, and is considered as the most solemn of contracts; and excepting in Protestant countries, it is regarded as a sacrament. In England, although not a sacrament of the church, it is not only celebrated as a religious ceremony, but until very recently it fell almost exclusively under the cognizance of the ecclesiastical courts. Now, however, the new court of probate and divorce exercises some of the functions heretofore belonging to the ecclesiastical courts, together with some others, especially in the matter of divorce, which are quite new in English law. In the United States marriage is, by law, only a civil contract; magistrates, equally with clergymen, have a right to solemnize it; but it is the prevailing practice of the country to have it performed by a clergyman, and attended with religious ceremonies. One very grave question remains in a state of singular uncertainty; it is: What is necessary to constitute a complete and valid marriage; or rather, are the ceremonies and forms, or any of them, which are instituted by law or are customarily used for the solemnization of marriage, indispensable, or is the mere consent of the parties sufficient? That such a question as this should be unsettled both in England and in this country, may well occasion surprise. But the true explanation of the mystery is, we apprehend, that very few persons have trusted to their own mere consent for the validity of their marriage, and the question has therefore very seldom come directly before the courts. Recently, however, this precise question has passed through the English courts. It came first before the court of queen's bench in Ireland, upon a trial for bigamy. The defendant was found guilty, and then, the first of the marriages not having been solemnized according to the direction, if not requirement of law, the question arose whether it was so complete and perfect as to make the crime of bigamy possible. There were four judges, and they were equally divided. The chief justice then (against his opinion) joined *pro forma* with the two who thought the marriage valid, and the crime of bigamy committed, for the purpose of having a decision by a major-

ity, from which an appeal could be made to the house of lords in England. The lords requested the opinion of the judges. They returned to the lords an opinion that the marriage was not full and complete without both the civil contract and the religious ceremony; but it was also their prevailing belief that the contract, although not constituting of itself a complete and valid marriage, gave to each party the right to call upon the proper court to compel the other party to make the marriage formal and unquestionable; a thing which could not be done here. The question of the validity of the marriage by mere consent was then fully argued by the ablest counsel in England before the lords, and the six law peers gave their opinions severally, each at great length; and they were equally divided—Lords Brougham, Denman, and Campbell being in favor of the validity of the marriage at common law, and Lords Lyndhurst, Cottenham, and Abinger against it. And it may be added as a curious result of legal forms, that as the house of lords came to no conclusion, they did not reverse the judgment of the Irish court of queen's bench. That decision was therefore confirmed, and the defendant sentenced accordingly, although the record of the case itself showed that one half of that court had not thought him guilty in law, and that the chief justice had said that he was (at the same time expressing his opinion that he was not) merely to enter up a judgment from which an appeal might be taken. Almost at the same time, by an odd coincidence, the same question came before the supreme court of the United States, and Chief Justice Taney, in deciding the case (on other grounds), said: "Upon this point the court is equally divided, and no opinion can be given." Chancellor Kent, in the first four editions of his "Commentaries," lays down the law that "the contract, if it be made *per verba de presenti* and remains without cohabitation, or if made *per verba de futuro* and followed by consummation, amounts to a valid marriage." But in the fifth and subsequent editions, in consequence of the division of opinion in the supreme court, he adds to the words above quoted, "in the absence of all civil regulations to the contrary." But these words leave the precise question in absolute uncertainty, for "regulations" of marriage of some kind exist in every civilized community, and the only question is: Is a marriage valid by consent or contract only, without any regard being paid to these regulations? There are in some cases *obiter dicta* to the effect that such a marriage is valid; but of course they are not authoritative like direct decisions; and even the *dictum* in the case last cited has been subsequently contradicted by higher authority. In Massachusetts, the supreme court has unequivocally declared such marriages illegal and invalid. Nor are we aware of a single case, in England or in this country, in which a widow has been allowed dower, or a child his inheritance, on the ground of the validity of a marriage resting on nothing but the

consent of the parties. As evidence of a regular marriage, reputation, cohabitation, acknowledgment and reception by the family, and other similar circumstances, are always receivable. On the other hand, cases for breach of promise of marriage are very frequent; in most of them seduction or cohabitation is shown; and if it appeared to the court that there had been also a regular marriage, the action would be stopped at once, on the ground that no action can be maintained between husband and wife. If therefore it is permitted to go on, as it always is, after evidence of the agreement of marriage and subsequent cohabitation, it follows that these are not the equivalent of a regular marriage; and this we believe to be the law.—In all our states certain marriages are prohibited, and would of course be void; as those between parties within a certain near lineal consanguinity; and those between parties within the age of consent, which is, for the most part, 15 for the man and 10 for the woman. (For marriages void for fraud or incapacity, see *DIVORCE*.) In many of the states there is now a just and wise provision that a marriage duly solemnized to all appearance shall not be made void by any want of formality, if it be consummated with a full belief on the part of both or either of the parties that they were lawfully married. But this provision, it may be remarked, would be wholly unnecessary if a marriage made by the contract of the parties was complete and valid. The same thing may be said of the statutory provisions permitting the marriages of Quakers to be solemnized after their own fashion.—Contracts to marry at a future time are recognized by law, and actions for the breach of them are, as we have said, very common; and the rules of law in relation to them are, in some respects, peculiar. The promises must be reciprocal, and a woman is bound by such a contract as much as a man. Nor is there any thing in the law to prevent an action by the man for a breach of this contract; but such actions are not common, and would not be favored by court or jury. The action may be brought by an infant, but not against one. The very words, time, and manner of the promise are not often provable, and are never indispensable; for precise and direct testimony to the promise is not demanded. Indeed, courts have, in some instances at least, gone quite far enough in instructing or permitting a jury to infer a promise of marriage from rather slight indications. In general, however, language used to third persons, expressive of a purpose, or even a promise, to marry the plaintiff, does not prove this promise, unless it was addressed to a parent or to one who stood in the place of a parent. This contract, like every other, may be on condition; and if the condition be reasonable, the law will respect it, and will not sustain an action on the promise unless the condition be performed. The defences to such an action are, generally, either a denial of the promise, or if that be proved, any thing which would make the marriage unlawful. But a previous and existing marriage

of the defendant, although it would have made his marriage with the plaintiff illegal and void, would not be a defence against this action, if it were unknown to the plaintiff when the agreement to marry was made by her. The defence most usually relied upon is a denial of the promise; and after that, the bad character of the plaintiff. If this be made out, it is a sufficient defence; but if it be attempted and fails, it is quite well settled that the attempt may be regarded by the jury as a ground for increasing the damages against the defendant. If the defence be a specific criminal act, it must be proved specifically. If it be general bad character, evidence of bad reputation is receivable. Neither specific bad conduct nor general bad character constitutes a defence, if they were known to the defendant when he made his promise; although, even then, they might be considered in mitigation of damages. As matter of law, the weight of authority is against permitting the fact of seduction to be received in evidence in an action for breach of contract to marry, for the purpose of swelling the damages. But it is sometimes directly received, and generally finds its way into the case; and the question of damages is in this case, more than in most others, entirely within the discretion of the jury. The action does not survive to the representative of a deceased promisee, nor can it be maintained against the representative of a deceased promisor.—Contracts in restraint of marriage are wholly void, by the policy of the law. Thus no action can be maintained on any promise or obligation not to marry; as not to marry any woman but the promisee; or by a widow not to marry again; or a promise not to marry within 6 years. There is also a class of contracts, which, from the frequency with which they appear in English law books, would seem to be not uncommon in that country, and which are called "marriage brokerage (sometimes brocage) contracts." They are, in general, contracts for the payment of money or transfer of property to some person, by way of compensation for his or her procuring a marriage for the party paying. Such a contract is declared void in England, on grounds of morality and the public good, without any reference to the expediency or propriety of the marriage itself. We are not aware that any action founded upon such a contract has ever come before the courts of this country; but we think that such an action would be defeated here as in England.

MARRIAGE SETTLEMENTS. A promise to give or advance to a woman, or settle upon her, money or an estate, on her marriage, is valid; because the marriage is regarded by the law as a fully sufficient consideration for it. But it must be made in writing and signed, under the English statute of frauds, and wherever that clause is reenacted here. A mere representation concerning the pecuniary condition of a party, if made in good faith, will not bind one to make his representations good. Letters from parents or relatives, when sufficiently specific,

are held to bind them.—Contracts in fraud of marriage settlements, and intended to defeat them, are void; as a private bargain with the husband, or the husband and wife, that he shall pay back part of her fortune; or a promise to restore money lent to give the appearance of wealth, and so procure the marriage; and a note given only to be exhibited and used for the same purpose has been held valid against the promisor. A creditor who conceals or denies his claims, so that the debtor may obtain the consent of the woman or her guardians, is bound by his denial or concealment as effectually as by a release.—As to the power of an infant, especially a female infant, to make a valid settlement of property in view of marriage, the law is not quite settled. An infant of either sex may certainly receive property in such a way; but in an important case in England (18 Vesey, 259), Lord Chancellor Eldon held that a female infant was not bound by her settlement of her estate, but, when she came of age, might annul the settlement and return into possession of all her rights and interests. We apprehend that in this country any such case would come before a court of equity, which would deal with it according to its merits. If the settlement were imprudent, oppressive, or injurious, although not dishonest, the court would find in the infancy of the maker sufficient authority to annul it; but if it were in itself unobjectionable, we do not believe that it would be interfered with.

MARROW, a peculiar soft, fatty substance, contained in a membrane of extreme delicacy, which fills the medullary canal of the long bones. The medullary membrane, or internal periosteum, is composed of minute vessels ramifying in a fine areolar tissue, whose existence may be easily seen in any well boiled bone; it sends numerous prolongations into the substance of the marrow, giving this its consistence, and supporting the fat vesicles in its cellular network. The fat vesicles, compared by Monro to clusters of pearls, do not communicate with each other; a fine artery runs to each, with an accompanying vein, and doubtless with numerous absorbents and nerves; the main vessel enters a special foramen near the middle of the shaft of the long bones. Marrow is found, not only in the medullary canal, but in the cells of the spongy ends of the long, in the areolæ of the short, and the diploë of the flat bones, and in the longitudinal pores of the compact tissue everywhere. The medullary membrane, when inflamed, may be possessed of an exquisite sensibility, but in ordinary cases it is not very sensitive; persons rarely complain, as the popular belief would lead one to suppose they would, when the marrow is lacerated by the saw during amputation of a limb, but they sometimes do when the operation is performed below the foramen where the nerve enters. There is no marrow or medullary cavity in the cartilage which precedes bone; an artery first appears, and then a membrane containing a reddish watery substance free from fat; the true marrow succeeds.

becoming more abundant and more fatty with advancing years, resuming its watery character in old age and in lingering disease. The medullary membrane supports the vessels before they enter the osseous tissue, and its extensive destruction is followed by the death of the bone. The fatty substance is not essential to the existence of the bones; it fills up a cavity destined to be free from calcareous matter, and may be absorbed into the system in case of need. Marrow is not found in young mammals, nor in adult birds; fishes, amphibians, and most reptiles have no medullary cavity, but the crocodile and some lizards have considerable cavities; mammals are like man in this respect, though the aquatic genera either have no medullary cavity, or a very small one filled with fluid oil; the marrow of herbivora is harder than that of carnivora, and is a palatable and nutritious article of food; the marrow of the ox, the bear, and other animals, forms the basis of many preparations for promoting the growth of the hair.

MARRYAT, **FREDERIC**, a British naval officer and author, born in London, July 10, 1792, died in Langham, Norfolk, Aug. 2, 1848. He entered the naval service at 14 years of age as a midshipman on board the frigate *Impérieuse*, commanded by Lord Cochrane, since earl of Dundonald, with whom he served 8 years, and participated in 50 engagements of more or less importance; in one he was so severely injured that he was left for dead, and was only roused to consciousness by the insulting conduct of a fellow midshipman with whom he was at enmity. He also distinguished himself on several occasions by leaping overboard and rescuing drowning shipmates, for which he subsequently received a medal from the humane society. In 1812-'15 he served on the North American coast, and participated in an action with gun boats on Lake Pontchartrain shortly previous to the battle of New Orleans. During the next 10 years he was employed on various naval stations, and for his gallant conduct in the Burmese war was several times thanked by the governor-general of India and the commander-in-chief of the British forces. In 1829, while commanding the *Ariadne* in the channel service, he commenced his literary career by the publication of "*Frank Mildmay, or the Naval Officer*," a novel of sea life, in which many of his early adventures are related. Among his other productions, which followed in rapid succession, may be mentioned the "*King's Own*," "*Peter Simple*," "*Jacob Faithful*," "*Japhet in Search of a Father*," "*Midshipman Easy*," "*Snarleyow*," "*The Poacher*," "*Poor Jack*," "*Masterman Ready*," &c., all of which abound in adventure, often of the most ludicrous character, and are written with a thorough knowledge of seamanship. In 1837 he published a "*Code of Signals for Vessels employed in the Merchant Service*," which has been adopted in England and other countries, and for which he received the cross of the legion of honor from Louis Philippe; and in 1839, after a tour in the United States, appear-

ed his "Diary in America," in 2 series of 8 vols. each. During the last 2 years of his life he was compelled by the rupture of several blood vessels to desist from all professional and literary labor.—SAMUEL FRANCIS, son of the preceding, born in 1826, died in London, July 12, 1855, served several years in the British navy, but resigned his commission, and in 1850 established himself in California. In 1853 he returned to England, and 2 years later published an account of his adventures under the title of "Mountains and Mole Hills" (London, 1855).

MARS, the Roman god of war, whose name in the Sabine and Oscan tongues was Mamers, and who was early identified with the Greek Ares. Before this identification he seems to have been an agricultural rather than warlike divinity. He was one of the three tutelary gods, to each of whom Numa was said to have appointed a flamen, and he enjoyed the highest honors after Jupiter. He was called Father Mars (*Marspiter*), being regarded as the parent of the Romans from having begotten the founders of Rome by Rhea Silvia, a priestess of Vesta. He was distinguished as Gradivus, Silvanus, or Quirinus, in his relations respectively to war, agriculture, and the state. The rites of his worship, as the dances of the Salii in armor, had reference to war and victory. The principal temples dedicated to him at Rome were that on the Appian way outside of the Porta Capena, and that of Mars Ultor in the forum. (See *ARES*.)

MARS, THE PLANET. See *ASTRONOMY*.

MARS, ANNE FRANÇOISE HIPPOLYTE BOUTET, a French actress, born in Paris, Feb. 9, 1778, died March 20, 1847. She was the natural offspring of Jacques Monvel, one of the first actors of the day, and a provincial actress named Mars-Boutet, and made her appearance upon the stage when quite a child. At 14 years of age she filled what the French call *rôles d'ingénues*, and when somewhat older, by the advice of Mlle. Contat, then the leading actress in comedy, attempted with success *jeunes amoureuses*. In this department she reached the first place, but made no decided impression upon the public until her personation in 1803 of a deaf and dumb girl in the *Abbé de l'Épée*. The grace and feeling which she evinced on this occasion created an enthusiasm in her favor, and thenceforward so rapid was her advance in the public favor, that soon after the retirement of her friend and instructress Mlle. Contat in 1809, she assumed the position of the first comic actress of the day. For the last 30 years of her professional life she was without a rival on the French stage in genteel comedy, every new part attempted by her being a success down to that of Mlle. de Belle-Isle in Dumas' drama of that name, produced in 1839, in which, although past 60 years of age, she showed so much grace and animation, and so skilfully concealed the ravages of time, as to appear like a young woman of 20. She took her leave of the stage on the night of March 7, 1841, in the *Misanthrope* of Molière and the *Fausse confidences* of Mari-

vaux. Although some of her greatest triumphs were achieved in the plays of Victor Hugo, Dumas, and other modern writers, she greatly preferred the dramas of the old school, especially the comedies of Molière and the *pièces d'intrigue* of Marivaux. Her personations of the fashionable lady or coquette of the old régime in these works are among the most cherished traditions of the French stage. Her figure, voice, action, and toilette were alike admirable, and in the expression of her countenance she invariably conformed to the spirit of the scene. She amassed a considerable fortune by her professional labors, and the latter years of her life were passed in a sumptuous retreat, where she daily received visits from persons eminent in literature or the arts. She left an estate valued at 800,000 francs to a son born 50 years previous to her death, and whom during the greater part of that time she had persistently refused to see.

MARSALA (anc. *Lilybæum*), a fortified seaport town at the W. extremity of Sicily, adjacent to Cape Boëo (anc. *Promontorium Lilybæum*), in the province of Trapani, 16 m. S. S. W. from the town of Trapani, in lat. 37° 48' 10" N., long. 22° 25' 10" E.; pop. about 20,000. It contains a cathedral, 16 churches, and various monastic, educational, and charitable establishments. It exports corn, cattle, oil, salt, and soda, but chiefly wine, to which it owes its importance. An English mercantile house was established there in 1789 to prepare the wine of the surrounding country (being a light white wine resembling that of Madeira) for exportation; but it did not come into much repute until 1802, when by order of Lord Nelson it was supplied to the Mediterranean fleet. There are now several English houses engaged in the wine business in Marsala, and about $\frac{1}{3}$ of the entire product, which is estimated annually at 30,000 pipes, is annually exported to Malta, England, the United States, and other foreign countries.—The ancient city of Lilybæum, of which Marsala occupies only the southern half, was founded by a colony of Carthaginians who escaped from the destruction of Motya by the elder Dionysius in 397 B. C. It prospered rapidly, and became the chief bulwark of the Carthaginian power in Sicily. In 276 B. C. Pyrrhus of Epirus made an unsuccessful attempt to capture it; and in 250 it was attacked by the Romans in the first Punic war with two consular armies and a formidable fleet. After several efforts to carry it by assault, the consuls converted the siege into a blockade, which was maintained for nearly 10 years without accomplishing its object; nor did the Romans obtain possession of it until it was surrendered by the Carthaginians at the conclusion of the war in part purchase of peace. From this period the harbor of Lilybæum became a principal station of the Roman fleet, and the city one of the great points of communication between Rome and Africa. The place continued prosperous even till the 16th century; but from the period when the emperor Charles

V. caused its harbor to be blocked up with a mound in order to protect it from the attacks of the Barbary corsairs, it ceased to hold the first rank among the maritime towns of W. Sicily, and gave place to Trapani. Few vestiges of the ancient city now remain. Numerous fragments of sculpture, however, vases, coins, &c., have been from time to time discovered, and some portions of an aqueduct are still standing. Marsala was Garibaldi's landing place in his expedition to Sicily in May, 1860, where he disembarked in presence of two Neapolitan war steamers.

MARSDEN, WILLIAM, a British orientalist, born in Dublin, Nov. 16, 1754, died near London, Oct. 6, 1836. In 1771 his father, who was a prominent merchant of Dublin, procured for him an appointment in the civil service of the East India company at Bencoolen, Sumatra. He there attained the office of principal secretary to the government, acquired a close acquaintance with the country and the Malay language, and in 1779 returned to England, where for some years he led a very retired life, occupied chiefly with historical and philological researches. In 1795 he was made under secretary to the admiralty, and afterward chief secretary, with a salary of £4,000; and on his resignation on account of ill health in 1807, the government conferred on him a pension of £1,500, which he surrendered, however, in 1831. Mr. Marsden was a member of nearly all the learned societies of the kingdom. In 1834 he bequeathed his rich collection of coins and medals to the British museum, and his valuable library of oriental books and MSS. to King's college, London. The most important of his works are: "History of Sumatra" (London, 1782); "Grammar and Dictionary of the Malay Language" (1812); a translation of the travels of Marco Polo (1817); and *Namimata Orientalia*, a treatise on eastern coins, &c. (1828-'5).

MARSEILLAISE, a national song of France, composed in 1792 by Rouget de l'Isle, an officer then stationed at Strasbourg, for a corps of volunteers who joined the army of the Rhine, and hence originally called *Chant de guerre de l'armée du Rhin*. Its success was so great that the corps immediately gained an accession of 200 men. It soon attained popularity throughout the country, and by its inspiring effect it is believed to have greatly contributed to the victories of the French revolutionary armies. In Paris it was sung for the first time by the band of men who were brought from Marseilles by Barbaroux to aid in the revolution of Aug. 10, 1792. Hence it was called *Le chant des Marseillais*, and afterward *La Marseillaise*. It has since continued to be the favorite song during all popular movements in France.

MARSEILLES (Fr. *Marseille*; anc. *Massilia*), the principal seaport of France, capital city of the department of Bouches-du-Rhône, on the N. E. shore of the gulf of Lyons, at the head of a bay the entrance to which is sheltered by a group of islets, in lat. 43° 17' 48" N., long. 5°

22' 15" E., 534 m. by railway S. S. E. from Paris; pop. of the arrondissement in 1856, 270,499; of the city, 215,196. It is connected by railway with the principal cities of France, by steamers with the chief ports of the Mediterranean, the Levant, and Algeria, and is the centre of the Indian overland mail service. On its N. side lies the old town, with filthy and tortuous streets and lanes, but containing some spacious squares, a remarkable town hall, and the remains of Roman ramparts. It is separated from the new town by a magnificent avenue, which is successively called Rue d'Aix, in its central part Rue du Grand Cours, and afterward Rue de Rome, and which extends in a straight line from the gate of Aix to that of Rome, traversing the entire length of the city from N. to S., and leading to the Prado, the most popular promenade on the seaside. The handsomest of the many fine streets of the new city is the Cannebière, which leads from the Grand Cours to the old harbor, and contains the most elegant shops, hotels, and coffee houses, including the beautiful *Café Turc*, chiefly frequented by Greeks and Levantines. The new city is built around the port. The quays are the most bustling and interesting parts of Marseilles, being constantly thronged by crowds of turbaned orientals, Greeks, Italians, English, and French, who are engaged in the business of the place. The animation of the city is only equalled by the picturesqueness of its locality. It rises over its port in the form of a gradually sloping amphitheatre; the surrounding hills are covered with olive gardens and vineyards, and with nearly 6,000 country houses or *bastides* of the citizens. Opposite the mouth of the harbor is the château d'If, in which Mirabeau was imprisoned. On summer evenings the inhabitants seek relief from the heat on the seaside, which is crowded with pleasure boats; and many fine residences and places of public entertainment are situated along the banks. All parts of the city are well supplied with water through a canal fed by the Durance, and opened in 1850, at a cost of \$10,000,000. The public buildings of Marseilles possess little architectural interest. The cathedral is said to have been built upon the site of a temple of Diana; the church of St. Victor is the most ancient church, and was formerly one of the most celebrated abbeys in Christendom. There is a French Protestant church, a place of worship for the English residents, a Greek church, and a synagogue.—Among the public institutions are an arsenal, a mint, a lyceum, a medical school, a hydrographic institution, a school for instruction in Arabic, an industrial and commercial academy, a fine observatory, a museum of pictures, antiquities, medals, and natural history, a library of nearly 200,000 volumes, a botanic garden, an academy of sciences, letters, and art, medical, agricultural, and statistical societies, and a number of newspapers, the best known of which is the *Sémaphore de Marseille*. The Grand theatre resembles the Odéon of Paris. Beside the Hô-

tel Dieu, there are a lunatic asylum, a lying-in hospital, several public institutions for the relief of the poor, a school for deaf mutes, and other public and private charitable establishments. The lazaretto, which was so large that it could hold the entire French army on its return from Egypt, was pulled down in 1850 and removed, as well as the sanitary department, to the quarantine roadstead of Frioul, which was formed by connecting the fortified islets of If, Pomègue, and Ratonneau by means of a breakwater.—The old harbor is an oblong basin 1,000 yards long by 330 broad, occupying an area of about 70 acres, has a depth of water varying from 18 to 24 feet, and can accommodate 1,200 merchant vessels. It is protected on the right by Fort St. Nicolas, and on the left by Fort St. Jean. On its N. is the new harbor, La Joliette, which was completed in 1855. It is formed by a breakwater 1,800 yards long, thrown into the sea parallel to the shore, and at a distance of 1,800 feet from it; two piers stretch toward it from the shore, at a distance of 600 yards from each other, so as to leave room for the entrance of vessels. It forms an inner basin and two outer harbors, and the former is connected with the old port by a canal, which runs behind the fort of St. Jean. The inner basin and this canal cover an area of about 70 acres. The foreign shipping comprises annually about 10,000 entrances and clearances, with about $\frac{1}{3}$ of the whole tonnage of France. Nearly as many vessels are engaged in the coasting trade. The registered shipping amounts to about 1,000 sailing vessels and over 100 steamers. The aggregate annual value of the imports and exports exceeds \$200,000,000. Marseilles is the principal grain depot of the Mediterranean. In 1857 the importation of wheat amounted to 10,007,343 bushels, maize 1,580,227, rye 511,744, barley 763,400, and oats 1,787,500; total, nearly 15,000,000 bushels. The exports to New York in 1858 employed 23 and to Boston 16 vessels, containing cargoes of olive oil, madder, garancine, soap, cream of tartar, almonds, lead, corks, and wine. Marseilles trades with all parts of the world, but chiefly with the Levant, Algeria, and other coasts of the Mediterranean. The branch of the bank of France at Marseilles discounted in 1859 bills of exchange to the extent of nearly \$100,000,000. The custom house receipts in 1858 were equal to those of Havre, namely, about \$8,000,000, or 19 per cent. of the total receipts of the empire. The annual value of the goods manufactured in the arrondissement of Marseilles is about \$25,000,000. The principal of these are soap, morocco and other leather, glass, porcelain, caps, straw hats, refined sugar, salt, liqueur, &c.—The ancient city was founded about 600 B. C. by Ionian colonists from Phocæa in Asia Minor. The prosperity and the commerce of the new settlement made rapid progress. Massilia became the rival of Carthage and the ally of Rome. Many new settlements were founded by her along the coast of the Mediterranean, and remained under her subjection,

and her navigators advanced as far as the Baltic (about 850 B. C.). Threatened by hostile tribes, the inhabitants of Massilia called the Romans to their assistance (153–125 B. C). The city was left in possession of its independence after the subjugation of Gaul, but in 48 B. C., having declared for Pompey at the outbreak of the civil war, it was seized by Cæsar and annexed to the Roman republic. Massilia became then celebrated as a seat of learning, and was called the new Athena. Christianity was introduced there in the 3d century. After various vicissitudes the city came in the 9th century under the sway of Boson, king of Arles, and in the 18th under that of the counts of Provence; and in 1481 Marseilles along with Provence was united to the crown of France. In 1524 it resisted the constable de Bourbon. The religious wars were carried on with great bitterness in Marseilles, and the city submitted to Henry IV. only in 1596. It was deprived of its franchise by Louis XIV. in 1660. In 1720 it was desolated by the plague, which destroyed 40,000 or 50,000 persons, on which occasion Bishop Belzunce distinguished himself by his zeal for the sick; a monument perpetuates his memory, and the poet Pope has celebrated his heroism. During the French revolution, the city declared itself in favor of the Girondists, but it was taken by the terrorists. Schlosser says: "Fréron erected a revolutionary tribunal without a jury in Marseilles, and selected the refuse of humanity for his judges. It almost appeared as if the commissioners of the convention would annihilate the city itself and even the harbor. Executions were of daily occurrence, and the destruction of buildings continued for months, while Fréron dated his reports to the convention, according to the savage style of his time, not from Marseilles, but from 'commune unnamed.'" It was only after the restoration of the Bourbons that Marseilles fully recovered from these calamities. The population has since doubled, and the colonization of Algeria has given a powerful impetus to its commerce.

MARSH, ANNE (CALDWELL), an English authoress, born in Staffordshire toward the close of the last century. Upon being married to Mr. Marsh, a junior member of a banking firm in London, she took up her residence in that city, and for many years devoted herself exclusively to domestic duties and the care of her children, appearing for the first time as an authoress with the publication of her "Two Old Men's Tales" in 1834. This work, which was favorably received, like the two succeeding ones, "Tales of the Woods and Fields" and "Triumphs of Time," was published anonymously. In 1843-'6 appeared her two most popular novels, "Mount Sorel" and "Emilia Wyndham," followed by "The Protestant Reformation in France," "Father Darcy," "Norman's Bridge," "Angela," "Mordaunt Hall," "Lettice Arnold," "The Wilmingtons," "Time the Avenger," and others.

MARSH, DEXTER, an explorer of the fossils of the Connecticut valley, born in 1806, died in Greenfield, Mass., in April, 1853. Without education, and by occupation a day laborer, his attention was first attracted to the subject of fossils by observing in 1835 the footprints in slabs designed for flagging stones. He was early engaged in the search for specimens, sometimes in the employ of others, but in later years chiefly on his own account, traversing the valley from the northern line of Massachusetts to Weathersfield, and visiting also the states of New Jersey and New Hampshire. The combination of much judgment in the selection of localities where footprints were likely to be found, and skill in the practical excavation of slabs, with great powers of physical endurance, made him most successful in procuring specimens; so that, at the time of his death, notwithstanding his frequent supplies to others, his cabinet contained, as the result of his own personal exertions, perhaps the choicest collection of fossil footprints and fishes then in existence. Among them were impressions, supposed to be quadrupedal, so small that a half dime would more than cover them; and others, measuring 14, 16, and in one instance over 18 inches in length, which were supposed to have been made by birds. One slab, 10 feet in length by 6 in width, contained at least 70 distinct footprints; and another, 7 feet by 4, was literally covered with perfect impressions. There were in all about 500 slabs with tracks and raindrops impressed upon them, and 200 specimens of fossil fishes, beside a large quantity of beryls obtained by Mr. Marsh at Acworth, N. H., during the last summer of his life, and many choice minerals and other objects of scientific interest. After his death the whole collection was sold by auction for about \$2,700. The best specimens were bought by Mr. Francis Alger of Boston, the Boston society of natural history, and Amherst college. For the largest single slab, which is the finest yet successfully excavated, the sum of \$375 was received.

MARSH, GEORGE PERKINS, LL.D., an American philologist, born in Woodstock, Windsor co., Vt., March 17, 1801. He was graduated at Dartmouth college in 1820, and then removed to Burlington, Vt., where he studied law and was admitted to the bar. In 1835 he was elected a member of the supreme executive council of Vermont, and in 1842 became a representative in congress, retaining his seat in that body by successive reelections until 1849, when he was commissioned by President Taylor as minister resident at Constantinople, which office he held for 4 years. In 1852 he was charged by the U. S. government with a special mission to Greece. During his residence abroad, he travelled extensively in the East and Europe, passing some time in Denmark, Sweden, and Norway, where he has long been recognized as a leading Scandinavian scholar. Since his return from Europe in 1853 he has been appointed one of the commissioners to rebuild the great house at Montpelier, which was burned in

Jan. 1857, and has served as railroad commissioner for Vermont for two years (1857-'59). In 1857 he was appointed by the governor of Vermont to make a report to the legislature in regard to the artificial propagation of fish. In 1844 he was chosen one of the corporation of the university of Vermont, of which body he is still a member. Beside numerous addresses and speeches, and contributions to periodicals, he has published a "Compendious Grammar of the Old Northern or Icelandic Language, compiled and translated from the Grammar of Rask" (Burlington, 1838); "The Camel, his Organization, Habits, and Uses, considered with reference to his Introduction into the United States" (Boston, 1856); and "Lectures on the English Language" (New York, 1860; originally delivered in 1859 in the post-graduate course of Columbia college, New York), in which he "aimed to excite a more general interest among educated men and women in the history and essential character of their native tongue, and to recommend the study of the English language in its earlier literary monuments rather than through the medium of grammars and linguistic treatises." In 1860 he received from Dartmouth college the degree of LL.D. He resides at Burlington, and is constantly occupied with literary labor and philological researches. He is a collaborator in the dictionary of the English language now in preparation under the auspices of the London philological society.—**CAROLINE (CRANE)**, wife of the preceding, born in Berkley, Bristol co., Mass., Dec. 1, 1816. She was married in 1838. Her published productions are: "The Hallig, or the Sheepfold in the Waters," translated from the German of Biermatzki, with a biographical sketch of the author (Boston, 1857); and "Wolfe of the Knoll and other Poems" (New York, 1860).

MARSH, HERBERT, D.D., an English prelate and author, born in London in 1757, died in Peterborough in 1839. He was educated at St. John's college, Cambridge. In 1788 he went to Germany, and resided for several years in Göttingen, where he published in German a series of pamphlets in defence of the war policy of Great Britain, for which Mr. Pitt rewarded him with a pension. On the French invasion of Germany he returned to England, and in 1807 was appointed Lady Margaret's professor of divinity at Cambridge. In discharging the duties of this office, he made an important departure from the practice of his predecessors, by substituting English for Latin in the delivery of his lectures. In 1816 he was raised to the see of Llandaff, and 8 years subsequently was translated to Peterborough. He was one of the first to introduce into England the biblical criticism of Germany, and was a distinguished opponent of both Calvinists and Roman Catholics. His principal works are: a translation of Michaelis's "Introduction to the New Testament" (London, 1792-1801); "The Authenticity of the Five Books of Moses considered" (4to., Cambridge, 1792); "The National Religion the

Foundation of National Education" (8vo., 1811); "Lectures on the Criticism and Interpretation of the Bible" (8vo., 1838); and "Lectures on the Authenticity and Credibility of the New Testament, and on the Authority of the Old Testament" (new edition, 1840).

MARSH, JAMES, D.D., an American scholar and philosopher, born in Hartford, Vt., July 19, 1794, died in Colchester, Vt., July 8, 1842. He was the son of an intelligent farmer, and grandson of one of the most prominent early settlers of Vermont, who was for several years lieutenant-governor of the state. The first 18 years of his life were passed in rural labors, which continued to have so strong a charm for him that even after completing his professional studies he entertained the project of retiring permanently to his father's farm. Taking the place of an elder brother, who had been destined for college but diverted from the purpose, he prepared himself at the academy in Randolph, and was admitted to Dartmouth college in 1813. He was intent upon general scholarship, but exhibited a preference for the ancient languages and literature, especially for the Greek, which he never ceased to study and admire. In 1815, during a period of unusual interest in religion shared by most of the students, occurred a change in his views and feelings which he regarded as the commencement of his regenerate life. Inclined to theology by a sense of duty and by the native bent of his mind, he entered the seminary at Andover immediately after his graduation in 1817. After remaining one year, he returned to Dartmouth as tutor, which office he filled two years, at the same time vigorously pursuing a wide range of studies. A literary club was formed, which he afterward esteemed one of his best schools of discipline. Resuming his course at Andover in 1820, he visited Cambridge by the way, hoping thereby "to learn how to defend my religious principles with more enlarged views, and on more philosophical grounds." At Andover he regularly prosecuted the study of the modern languages, explored the then almost new field of German erudition, began to make acquaintance with Kant's "Critique of Pure Reason," undertook to read through the works of Plato, making a copious analysis of each dialogue, appreciated Wordsworth and Coleridge, and aimed to systematize his various acquirements by introducing a principle of unity. During his last year at Andover he wrote an article for the "North American Review" on ancient and modern poetry, contrasting the genius of the ancients and the moderns, and with a friend began to translate from the German Bellermaun's work on the geography of the Scriptures. The intensity of his application affected his health, and a few months before completing his course he made a tour to the South, visiting New York, Princeton, and Philadelphia. Several positions as professor or editor were sought for him, while he was at home finishing the translation of Bellermaun. His habits as a student had conveyed an im-

pression that he was wholly given to books and speculative inquiries, and was not sufficiently attentive to more practical duties. His aversion to every thing merely formal and outward in religion added to this impression. He suggested that conference meetings might be made more profitable by changing them into a kind of a religious levee; and though he excelled in conversational discussion in a small and congenial circle, he was thoroughly disinclined to preaching, and regarded his mental habits and tendencies as incompatible with it. After a season of hesitation and projects, he became a professor in Hampden Sidney college, Va., giving a portion of his time to the adjacent theological school. The department of oriental languages was ultimately expected for him. He was ordained and married at Hanover in 1824, and on returning to his duties began his translation of Herder's "Spirit of Hebrew Poetry," the first parts of which appeared in the "Christian Repository" at Princeton. In 1826 he was appointed to the presidency of the university of Vermont, and important changes in the collegiate system were immediately due to his suggestion. He held that the requirements for admission were too strict, that the course of study and recitation did not allow sufficient latitude for individual inclinations and tendencies, that the modes of instruction were too formal and too much attached to text books, and that morals and character were too exclusively judged by the observance of minute regulations. He urged a freer and more parental discipline, and that the standard of scholarship should be determined and recorded, not by the routine of recitation, but after a close examination at the end of each year. During his presidency he had charge of the department of metaphysics and ethica, which became his exclusive field of labor in 1833. The practical duties of the presidency he had found irksome, and therefore, in order to devote himself entirely to his favorite studies, he exchanged the place for the professorship of moral and intellectual philosophy. In 1828 occurred the death of his wife, whose sister he subsequently married; in 1829 he contributed a series of articles on popular education to the "Vermont Chronicle," and a review of Stuart's "Commentary on Hebrews" to the "Christian Spectator," the latter containing the germ of his most characteristic writings. He was among the first in this country to revive the scholastic dogma of *Credo ut intelligas*, in opposition to that of *Intellige ut credas*, which the English and Scotch philosophy had made prevalent. About this time he received a copy of Coleridge's "Aids to Reflection," and was struck by the coincidence of the thoughts with his own, and by the adaptedness of the work to the end which he had himself proposed. Leighton also, who was the theme of the "Aids," was one of his favorite authors, and he therefore availed himself of the opportunity to introduce both Leighton and Coleridge to the American public. He wrote a prelimi-

nary essay for his edition of the work (1829), which established his reputation as a scholar and metaphysician, and which was reproduced in London as the introduction to the "Aids," and in New York prefixed to a complete edition of the writings of Coleridge (1853). To advance the cause of spiritual philosophy and promote the growth of a truly spiritual life, he published a volume of selections from the old English divines (1830), containing Howe's "Blessedness of the Righteous" and Bates's "Four Last Things," and in 1833 completed his translation of Herder's "Spirit of Hebrew Poetry," which he believed would be highly advantageous to the formation of correct biblical views. The larger works which he contemplated were but partially executed. The most important of these was a system of logic, the plan of which he drew up in 1832, and as a preparation for which he made a free translation of the German work of Fries on the same subject. He also planned a treatise on psychology, which was to embody his highest speculations. Near the close of his life he committed his papers to Prof. Torrey, of the university of Vermont, who published a volume of "Remains" with a memoir (Boston, 1843). It consists chiefly of his academical philosophical lectures and theological discourses, evincing a profound insight and discrimination, and written in an elaborate and admirable style. His correspondence and minor writings abound in felicitous passages which prove his philosophical genius and culture.

MARSHAL (Fr. *maréchal*; Germ. *Mar-schalk*; mediæval Lat. *marescallus*), a term originally applied to the person who had charge of the horses of the king or other high dignitary. In the middle ages he was the chief officer of arms, and at tournaments regulated combats in the lists; but ultimately the title was borne by both civil functionaries and military officers. In England, until 1849, the marshal of the king's household presided over the knight marshal's court created by Charles I., and which had jurisdiction of personal actions within a circuit of 12 miles around Whitehall. The marshal of the king's bench has the custody of the marshalsea or king's bench prison in Southwark. In the United States, a marshal is an officer of one of the federal judicial districts, having duties similar to those of a sheriff. (See EARL MARSHAL, and FIELD MARSHAL.)

MARSHALL, the name of counties in 8 of the United States. I. A N. W. co. of Va., lying between Ohio and Pennsylvania, and bordered on the W. by the Ohio river; area, 230 sq. m.; pop. in 1850, 10,138, of whom 49 were slaves. It has a hilly surface and fertile soil. The productions in 1850 were 74,976 bushels of wheat, 302,130 of Indian corn, and 38,144 lbs. of wool. There were 18 grist mills, 8 tanneries, 15 churches, and 700 pupils attending public schools. Value of real estate in 1856,

\$2,426,546; increase since 1850, 15 per cent. The Baltimore and Ohio railroad passes through the county. Capital, Elizabethtown. II. A N. E. co. of Ala., intersected by the Tennessee river and drained by its branches and by the head waters of the Black Warrior; area, 600 sq. m.; pop. in 1850, 8,846, of whom 868 were slaves. The surface is mountainous, being traversed by ridges of the Appalachian system, and the soil is generally fertile. The productions in 1850 were 857,201 bushels of Indian corn, 38,240 of sweet potatoes, 2,681 lbs. of rice, and 1,966 bales of cotton. There were 11 churches, and 429 pupils attending public schools. Capital, Warrenton. III. A N. co. of Miss., bordering on Tenn., drained by the Tallahatchie, Tippah, and Coldwater rivers; area, 880 sq. m.; pop. in 1850, 29,689, of whom 15,417 were slaves. It has an undulating surface and fertile soil. The productions in 1850 were 1,236,006 bushels of Indian corn, 266,640 of sweet potatoes, 82,688 lbs. of rice, and 32,775 bales of cotton. There were 15 grist mills, 11 saw mills, 4 tanneries, 88 churches, 3 colleges, and 524 pupils attending schools. The Mississippi central railroad intersects the county, passing through the capital, Holly Springs. IV. A central co. of Tenn., intersected by Duck river; area, about 350 sq. m.; pop. in 1850, 15,616, of whom 8,634 were slaves. It has a diversified surface and a generally fertile soil. The productions in 1850 were 1,291,675 bushels of Indian corn, 161,727 of oats, 42,192 of sweet potatoes, 60,757 lbs. of tobacco, 34,544 of wool, and 1,054 bales of cotton. There were 6 grist mills, 6 saw mills, 5 tanneries, 35 churches, and 2,971 pupils attending public schools. Capital, Lewisburg. V. A W. co. of Ky., bounded N. and E. by the Tennessee river and intersected by Clarke's river; area, about 350 sq. m.; pop. in 1850, 5,269, of whom 249 were slaves. It has an undulating surface and fertile soil. The productions in 1850 were 192,835 bushels of Indian corn, 27,454 of oats, 122,883 of tobacco, and 6,519 lbs. of wool. There were 2 grist mills, 2 saw mills, 2 tanneries, 16 churches, and 720 pupils attending public schools. Capital, Benton. VI. A N. co. of Ind., drained by the Yellow and Tippecanoe rivers; area, 440 sq. m.; pop. in 1850, 5,348. It has a level surface and fertile soil. Iron ore abounds. The productions in 1850 were 168,080 bushels of Indian corn, 51,435 of wheat, 28,827 of oats, and 18,586 lbs. of wool. There were 3 grist mills, 3 saw mills, 2 tanneries, 4 churches, and 360 pupils attending public schools. The Pittsburg, Fort Wayne, and Chicago, and the Cincinnati, Peru, and Chicago railroads form one line from the E. and branch to the W. from the capital, Plymouth. VII. A N. central co. of Ill., intersected by the Illinois river; area, 445 sq. m.; pop. in 1855, 9,900. It has an almost level surface and fertile soil. The productions in 1850 were 104,469 bushels of wheat, 46,990 of oats, and 392,317 of Indian corn. There were 4 grist mills, 2 saw mills, 5 churches, and 800

pupils attending public schools. Capital, Lacon. VIII. A central co. of Iowa, intersected by Iowa river; area, 576 sq. m.; pop. in 1859, 5,713. It has an undulating surface and fertile soil. The productions in 1859 were 34,515 bushels of Indian corn, 25,287 of wheat, 83,182 of oats, 22,323 of potatoes, 8,874 tons of hay, 105,513 lbs. of butter, and 9,170 galls. of sorghum molasses. Capital Marietta.

MARSHALL, the capital of Calhoun co., Mich., on the right bank of the Kalamazoo, at the mouth of Rice creek and on the Michigan central railroad, 107 m. from Detroit; pop. in 1850, 2,822; in 1860 estimated at 4,000. It contains many mills and manufacturing establishments, 10 churches (9 Protestant and 1 Roman Catholic), and a number of schools.

MARSHALL, CHARLES KIMBALL, D.D., an American clergyman, of Huguenot ancestry, born in Durham, Me., Aug. 29, 1812. He twice interrupted his school studies to work in a printing office and at other mechanical trades, and in 1829 went to New Orleans, where he engaged in business. He spent a short time at Woodward college, Ohio, and, after again applying himself to business pursuits in New Orleans, accepted an invitation to fill the pulpit of the Methodist church in Natchez, Miss., having previously been licensed to preach. He soon became one of the most prominent ministers in the state, took an active interest in its agricultural, moral, and educational development, was the author of the Mississippi temperance law, and has been conspicuous as an advocate of the policy of excluding from southern schools all text books which betray hostility to southern institutions. He now resides in Vicksburg.

MARSHALL, JOHN, an American jurist, born in Fauquier co., Va., Sept. 24, 1755, died in Philadelphia, July 6, 1835. He was the eldest of 15 children of Col. Thomas Marshall, a planter who signalized himself during the revolution, especially at the battle of Brandywine, where his regiment bore the brunt of the British assault, led by Cornwallis in person. The maiden name of his mother was Mary Keith. The region in which he was born was at that time very thinly settled; the people were primitive and simple in their modes of life; and the facilities for the education of youth were extremely limited. This fact, operating with a narrow fortune, made it impossible for Col. Marshall to give his numerous children a thorough education; but he supplied this want by devoting himself personally to their training. He seems to have been a gentleman of culture, with a strong taste for the English classics; and we have the testimony of Judge Marshall that "he was a far abler man than any of his sons." "To him," he added, "I owe the solid foundation of all my own success in life." Col. Marshall implanted in the youth a strong love of English literature, especially for poetry and history; and this fondness, thus early acquired, accompanied him throughout life. At the age of 12 he had transcribed Pope's "Essay on

Man," and other poems by the same author, and knew by heart a large portion of his writings. Milton, Shakespeare, and Dryden were also then and afterward his favorite reading; and his admiration of them led him to indulge in frequent poetical compositions, none of which, however, seem to have been published. At the age of 14 he was sent to Westmoreland, and placed at the school of the Rev. Mr. Campbell, where he was instructed in English and Latin. At this school James Monroe was one of his fellow students. Returning home at the end of a year, he resumed his studies under the direction of a Scottish clergyman, the Rev. Mr. Thompson. His hours were however still largely devoted to his favorite poets, and many proofs remain of the fact that at this time, and for many years afterward, the future chief justice was full of dreamy romance and poetical enthusiasm. He would wander deep into the woods, and indulge in solitary meditations, or rising early seek some hill from which he could see the beauties of sunrise. Field sports and athletic exercises in the open air were also habitual with him; and in these pursuits he acquired that physical strength of constitution which enabled him to endure the enormous amount of labor which his subsequent official career involved. The surroundings of the youth were eminently calculated to develop the traits of character necessary in a great republican judge. Every thing was natural, truthful, and unartificial at the plain old homestead. Col. Marshall ruled his large household with the kindness and simplicity of a patriarch; and instilled into the minds of his children principles of truth, faith, and uprightness, which shaped their characters and directed their entire careers. John Marshall was intended for the law, and commenced the study of the profession at the age of 18; but the impending struggle with Great Britain drew him away from his books before he had obtained a license to practise. The year 1775 came, and a vague presentiment of the approach of important events filled every mind. The war spirit began to agitate the youths of Virginia, and young Marshall partook of the general sentiment. He joined a military company in his neighborhood, applied himself with ardor to the drill, and when news came of the battle of Lexington, and the march of Patrick Henry upon Williamsburg, he addressed the company in eloquent terms, and urged them to prepare for every emergency. The call for their services was not long delayed. Dunmore fled from the capital, and Col. Henry sent to the upper counties for volunteers to drive the governor from the soil of Virginia. The response was prompt. Three companies quickly assembled, among whom were the Culpepper "minute men," who wore green hunting shirts, with "Liberty or Death" in white letters on the bosom. Their banner displayed a coiled rattlesnake with the motto: "Don't tread on me." In this company John Marshall was lieutenant; his father was elected major of the

regiment. It marched immediately, and took an important part in the battle of Great Bridge. "Col. Stevens of the Culpepper battalion," said the "Virginia Gazette," "was sent round to the left to flank the enemy, which was done with so much spirit and activity that a rout immediately ensued." The Culpepper battalion was Marshall's company, and he was lieutenant of the flanking party, which advanced in face of a murderous discharge from the enemy posted on the causeway, and terminated the engagement. In July, 1776, he was made lieutenant in the 11th Virginia regiment, on continental service, and marched with his company to the north. In May, 1777, he was promoted to a captaincy. From the time of his entrance into the army to the close of 1779, Marshall was in active service. He took part in the engagement at Iron Hill, and in the battles of Germantown, Brandywine, and Monmouth. He shared the hardships and sufferings of the troops at Valley Forge, and his unvarying good humor and sanguine hopefulness cheered his companions in the darkest hours of that terrible winter. "The officers of the Virginia line," we are told, "appeared almost to idolize him." He acted frequently as deputy judge advocate at this period, and secured the warm regard of Gen. Washington. In the winter of 1779 he was sent to Virginia to take command of a new corps to be raised by the legislature. While this subject was under discussion, he attended a course of law lectures delivered by Mr. Wythe at William and Mary college, and Bishop Madison's lectures on natural philosophy. In the ensuing summer he was licensed to practise law, but his military duties drew him back to the army. The project to raise additional forces in Virginia seems to have failed; and the young man set out alone and on foot to make the long journey to head-quarters. On his arrival in Philadelphia, the appearance of the future chief justice of the United States was so shabby and poverty-stricken, that the landlord of the hotel at which he stopped refused him admittance. He continued in the army until after the invasion of Virginia by Arnold in 1781, when, finding a redundancy of officers in the Virginia line, he resigned his commission. This was the end of Capt. Marshall's military career. The surrender of Cornwallis at the close of the year terminated the war; the courts, long silenced by the tumult, were reopened and thronged with advocates; and the young man prepared to enter the arena as an attorney. His success was marked from the commencement. Personally he was very popular. The benevolence, placidity, and sweetness of his temper, which at times changed to a joyous good humor, gained him a host of friends; and "that extraordinary comprehension and grasp of mind, by which difficulties were seized and overcome without difficulty or parade, commanded the attention and respect of the courts of justice." In 1782 he was a member of the house of delegates from Fauquier, and in the au-

turn of the same year was appointed one of the council of state. In Jan. 1783, he was married, at the "Cottage" in Hanover, to Miss Mary Willis Ambler, daughter of Treasurer Ambler, whom he had met at Yorktown soon after the battle of Great Bridge. It is said that after seeing the parson he possessed but a single guinea. His union with this lovely and estimable lady continued for nearly 50 years. He soon afterward resigned his seat in the executive council, but did not return to Fauquier. He fixed his residence in Richmond for the advantages of practice which the place offered, and applied himself with energy to his profession. In spite of his removal from the county, his old neighbors reelected him a member of the house, and in 1787 he sat in the same body as representative from the county of Henrico. A period had now arrived in the history of the country when strong heads and stout hearts were as necessary as in the great struggle of the revolution. The war of swords and bayonets had ended, and the land was free; but a plan of government adequate to the wants of the country had to be adopted, and the paramount question arose whether that government should be a weak or a strong one. The note of battle was sounded in the general assembly during the session when Marshall sat for Henrico, and the friends and enemies of a strong central authority ranged themselves formally under the opposing banners. The Philadelphia convention agreed upon a constitution, and it was submitted for ratification or rejection to the states. In June, 1788, the Virginia convention to act upon the subject assembled, and Marshall was a member of the body. The instrument had been for many months the topic of vehement discussion throughout the commonwealth, on the hustings and in the newspapers; and on the floor of the convention the final struggle was about to take place. Mr. Marshall took a conspicuous stand by the side of James Madison, Edmund Pendleton, and other distinguished advocates of its adoption. His defence of the constitution against its assailants was masterly. He did not speak as frequently as some other members, but on three great occasions—the debates on taxation, on the judiciary, and on the power over the militia—he gave full scope to his powerful logic, and massive faculty of reasoning. The instrument was finally adopted by a vote of 89 to 79. Marshall largely increased his reputation by the part which he had taken in the debates. He was associated with Madison in the public mind; and the two men were justly regarded as having done more for the adoption of the great federal plan of government than any other members of the body. On the adjournment of the convention, Marshall returned to his practice, with the fixed intention to take no further part in public affairs. From this resolution he was however forced to depart. The legislature having directed, in 1788, that thereafter the city of Richmond should be entitled to a representative in the house, Marshall was urgently pressed to be-

come a candidate for the place. The hostility exhibited by the state rights party to the national government, and the necessity of having in the legislature a champion of the federalists, were the grounds of this application, and Marshall reluctantly yielded. He was elected, and continued to sit in the assembly during the sessions of 1789, 1790, and 1791. Throughout this period, the opposing policies of the republicans and federalists were passionately debated in the legislature. Virginia was the head-quarters of the state rights party, whose views were represented in the national cabinet by Thomas Jefferson; and a majority of the people of the commonwealth were opposed to the measures of the administration. The great question whether the U. S. constitution should be strictly or liberally construed was the point at issue; and Marshall advocated the latter view with conspicuous ability. Every measure of the administration was discussed with no little acrimony; and heated passion was often involved in the debates. Marshall supported the federal view with the calmness and moderation of tone which characterized him, but with all the vigor which his friends had expected. When in 1792 he retired from the body, he left not an enemy behind him. He had overthrown many in debate, but never lost a friend. From 1792 to 1795 he devoted himself exclusively to his practice, which had greatly increased. In the next year he appeared prominently in public meetings on the side of the administration of Gen. Washington, and powerfully defended the proclamation of neutrality occasioned by the insolent conduct of Citizen Genet. He advocated the policy of Washington both orally and with his pen; and secured the passage, by a meeting of the citizens, of a set of resolutions approving it, which he had drafted. In 1795 he sat again in the house of delegates. He had been elected "not only without his approbation, but against his known wishes." The great topic of public discussion at the period was the treaty with Great Britain, negotiated by Mr. Jay in 1794. The senate advised its ratification, but vehement efforts were made by the state rights party throughout the country to induce the president to withhold his approval. Popular meetings were held in every part of Virginia, and in the legislature, as well as elsewhere, the most violent debates took place. The land rang with angry discussion, and the republicans denounced the treaty as the sum of all evil. A meeting in Richmond characterized it as insulting, injurious, dangerous, and unconstitutional; and the hot blood of the speakers scarcely permitted them to respect the great name of Washington. It was at this moment that Marshall appeared as the champion of the treaty and the administration. Before an assembly of the same citizens who had denounced the proposed measure, he defended the treaty with such power of reasoning, that they reversed their former action, and adopted resolutions in favor of the federal policy by a considerable majority. The

contest in the legislature followed. The opponents of the administration introduced condemnatory resolutions, and triumphantly demanded what power the executive possessed to conclude a commercial treaty. Marshall took part in the debate upon the resolutions, and delivered a speech which is represented to have been one of the greatest and noblest of his performances. "His vast powers of reasoning," says Judge Story, "were displayed with the most gratifying success. He demonstrated not only from the words of the constitution, but from the universal practice of nations, that a commercial treaty was within the scope of the constitutional powers of the executive; and that this opinion had been maintained and sanctioned by Mr. Jefferson, by the Virginia delegation in congress, and by the leading members of the convention on both sides." The result of the speech was encouraging to the friends of the administration. The constitutional ground of objection was abandoned; and the assembly confined itself simply to an expression of its disapprobation of the treaty on the ground of its inexpediency at the time. This drawn battle, as it may be styled, in the heart and centre of the enemy's country, and with all the republican force arrayed against the advocate of the administration, greatly extended and increased the honorable renown of Marshall. Washington offered him the place of attorney-general of the United States, but this he declined, as interfering with a practice at the bar which had now become very lucrative. He continued in the legislature, which did not conflict with his professional engagements, and remained a staunch advocate of the policy of Washington, which he persistently defended against the strictures of the republican members. In the same year, 1796, he was offered the appointment of minister to France, to succeed Mr. Monroe, but declined it for the same reasons which had impelled him to refuse the attorney-generalship. Gen. Pinckney was appointed in his place, but the French directory refused to receive him; and in 1797 President Adams, who had succeeded Washington, sent a new commission to Marshall, who yielded his objections, and with Pinckney and Gerry proceeded as envoy extraordinary to Paris, to negotiate with the directory in relation to the obstructions thrown in the way of the commerce of the United States. These negotiations failed; but the correspondence between Marshall and Talleyrand proved highly honorable to the powers of the former, and greatly added to his reputation in America. The envoys returned in June, 1798, and were received with unmistakable evidences of popular approval and applause. On his arrival at New York, Marshall found himself the centre of all eyes, and his entrance into the city was a species of triumph. He was honored with a military escort, and crowds of the citizens thronged his lodgings, to testify their gratitude and respect. Public addresses were offered him, and a public dinner by members of both

houses of congress, "as an evidence of affection for his person, and of their grateful approbation of the patriotic firmness with which he had sustained the dignity of his country during his important mission." Marshall had faithfully reflected the views of the administration and the federal party of the country generally, in his official acts; and he approved of the series of measures directed against France, and so violently opposed by the republicans. The alien and sedition laws do not seem, however, to have received his approval; and during his subsequent career in congress he voted for the repeal of the most obnoxious section of the latter. He returned to the law, but was soon again urged to appear in defence of his party. Washington sent for him to visit him at Mount Vernon, and he finally yielded to the solicitations of his old commander, and consented to run for congress. He did so, and was elected in 1799 by a small majority. During the canvass, Adams offered him a seat on the bench of the U. S. supreme court, but he declined it. In congress he became the main stay and reliance of the administration. It was a period of bitter political animosity, and passionate conflict between the two great parties of the country. Virginia had recorded her solemn protest, in the resolutions passed by her assembly in the winter of 1798, against the alien and sedition laws, and had established arsenals and armories to defend her rights by force if necessary. Washington, the great bulwark of the federal party, was no longer at the head of the government; and the forces of the republicans, flushed with the daily increasing revulsion against the federal administration, began to charge the dispirited squadrons of their enemies, and put them to rout. It was at this crisis of affairs that Marshall appeared in congress as the federal leader, against the growing influence of the republicans. In the debates upon great constitutional questions, "he was confessedly the first man in the house," says Mr. Binney. "When he discussed them, he exhausted them; nothing more remained to be said; and the impression of his argument effaced that of every one else." The great event of Marshall's career in congress was the speech which he made in defence of the administration, in the affair of Jonathan Robbins. This person had committed a murder on board a British frigate, and fled to the United States. On the requisition of the British minister, who alleged that Robbins was a subject of Great Britain, he was surrendered by President Adams, in compliance with the clause in relation to such cases contained in Jay's treaty. The opposition in congress seized upon this act of the president, and furiously assailed him. All the old bitterness against the treaty seemed to have merely been pent up; it now rushed forth with clamorous violence. Mr. Livingston introduced a resolution of censure on the president for the surrender of Robbins at the dictation of the British minister, and upon this resolution took place an animated debate. The speech which he made on

this occasion is the only one which Marshall ever revised, and is that by which he is best known to the world. It was unquestionably one of the best evidences which he ever exhibited of that massive strength of reasoning which he possessed perhaps in greater degree than any other personage of the epoch. A competent authority has said of the speech: "It has all the merits and nearly all the weight of a judicial sentence. It is throughout inspired by the purest reason and the most copious and accurate learning. It separates the executive from the judicial power by a line so distinct, and a discrimination so wise, that all can perceive and approve it. It demonstrated that the surrender was an act of political power which belonged to the executive; and by excluding all such power from the grant of the constitution to the judiciary, it prepared a pillow of repose for that department, where the success of the opposite argument would have planted thorns." Judge Story says of the speech that "it was *réponse sans réplique*—an answer so irresistible that it admitted of no reply. It silenced opposition, and settled then and for ever the points of national law upon which the controversy hinged." In May, 1800, Marshall was appointed secretary of war, but before his entry on the duties of the office was offered the place of secretary of state, which he accepted. In this capacity he conducted several important discussions with the British minister, and drew up the instructions to Mr. King, the American minister to London, which hold a prominent place among the great state papers of the country.—On Jan. 31, 1801, he was appointed by President Adams chief justice of the U. S. supreme court. This, like almost every public appointment which he received throughout life, came to him unasked. He had even recommended another for the place of chief justice, but Adams disregarded his advice. The senate unanimously confirmed the appointment; and thus commenced that long career of sober usefulness and unostentatious devotion to the public good which has made the name of John Marshall so widely honored and beloved. He continued to act in the capacity of chief justice from this time to the period of his death. Of the eminent talents which he brought to the performance of his judicial functions, there can be but one opinion; and in the great tribunal of ultimate resort over which he presided, his influence is known to have been paramount. Of its adjudications a distinguished jurist has said: "The decisions of the supreme court of the United States have raised the renown of the country, not less than they have confirmed the constitution. In all parts of the world its judgments are spoken of with respect. Its adjudications of prize law are a code for all future time. Upon commercial law it has brought us nearly to one system, befitting the probity and interests of a great commercial nation. Over its whole path learning and intelligence and integrity have shed their combined lustre." In 1805 Judge Marshall published in 5

vols. a "Life of Washington," largely based upon unpublished official documents, in which he defended the course of Washington's administration against the assaults which had been made upon it by the republican party, with judicial moderation and dignity, but masterly effect. The first volume was separately published in 1824, as "A History of the American Colonies;" and in 1832 the whole work was revised and compressed into 2 volumes. The "Life of Washington" remains the most dignified, imposing, and trustworthy record of the events attending the establishment of the government. In 1828 Judge Marshall was a delegate from the city of Richmond to a convention held in Charlottesville, for devising a system of internal improvements, to be recommended to the legislature, and took part in the debates of the body. In 1829 he represented Richmond in the reform convention of that year to revise the old constitution of the commonwealth. He was now long past his prime, and his voice had become very feeble; but he exerted himself in debating the provisions of the new state constitution, as he had done in the old struggle to define the powers of the constitution of the United States. The basis of representation and the structure of the judiciary were the subjects upon which he chiefly dwelt. The debates of the convention were animated, and at times stormy. The east and the west contended vehemently for their opposing systems on the basis question; and the body threatened to separate in confusion. At last a compromise was agreed to, and upon this compromise Marshall made one of his most effective speeches. He said that he "hailed that auspicious appearance with all the joy with which an inhabitant of the polar regions hails the reappearance of the sun after his long absence of six tedious months." Of this speech John Randolph said: "The argument of the chief justice is unshaken and unanswerable. It is as strong as the fortress of Gibraltar." Its reasoning, he added, had been as little affected by the assaults upon it, as Gibraltar would be injured "by battering it with a pocket pistol." Judge Marshall's influence in the convention was very great, and the peaceful solution of the exciting questions which arose between the two sections of the commonwealth, was in a great measure due to his appeals in favor of moderation and mutual conciliation. The compromise scheme was adopted, and the convention adjourned. For many years Judge Marshall had been suffering greatly from a dis-ease of the bladder. A surgical operation pro-
 hot him relief, but a hurt received in travel-
 them rought on an attack of liver complaint. It was a-
 ired to Philadelphia for medical assist-
 as the champrilisease overpowered him, and he

 reasoning, thaeatly revered and beloved. In
 tion, and adofngraceful. Mr. Wirt describes
 federal policy byagre, emaciated; his muscles

relaxed, and his joints so loosely connected as not only to disqualify him apparently for any vigorous exertion of body, but to destroy every thing like harmony in his air or movements. Indeed, in his whole appearance and demeanor—dress, attitudes, gesture, sitting, standing, or walking—he is as far removed from the idolized graces of Lord Chesterfield as any other gentleman on earth." In spite, however, of this ungainly person, no one was a greater social favorite than the chief justice. The people of Richmond regarded his eccentric figure with strong personal affection as well as respect. The black eyes, under their bushy gray brows, beamed with good nature, and the lips were habitually smiling. The courtesy of the judge was one of his most beautiful traits. It was the spontaneous exhibition of the simple and kindly emotions of his heart. Pure benevolence and philanthropy displayed itself in every word which he uttered. He gave his hand to the plain yeoman clad in homespun, as courteously and sincerely as to the greatest personage in the country. He had the same simple smile and good-humored jest for both, and seemed to recognize no difference between them. It was instructive to estimate, in the good chief justice, the basis and character of true politeness. John Randolph, one of the most fastidious and aristocratic of men, left his opinion that Marshall's manner was perfect good breeding. In dress and bearing it would be difficult to imagine any one more simple than Judge Marshall. He presented the appearance of a plain countryman rather than a chief justice of the United States. He had a farm in Fauquier co., and another near Richmond; and he would often return from the latter, to take his seat on the bench, with burrs sticking to his clothes. His great passion was the game of quoits; and he was a member of the club which met, as it still meets, at Buchanan's Spring, near the city, to play at this game. Here the governor of Virginia, the chief justice, and the most eminent lawyers of the court of appeals, were found by a French gentleman, Baron Quinet, with their coats off, gaily pitching quoits, with the ardor of a party of urchins. In these simple amusements passed the hours of leisure which Judge Marshall could steal from his exhausting judicial toil. At such times he seemed to become a boy again, and to forget the ermine. His fondness for other social enjoyments was great. He was the centre of a brilliant circle of men, who were many of them famous; and the tradition of their dinner parties, and the jests which circulated, is still preserved. The judge always provided for his dinner by proceeding to market in person; and on one of these occasions he carried home a turkey for a fashionable young gentleman, who took him for a simple countryman, and offered him a shilling for his trouble. The shilling was courteously refused by the chief justice, who calmly proceeded on his way, without revealing his name. The quality which made him the centre and chief object of attention in the

famous circle of which we have spoken, was not his wit or brilliancy in conversation. It was rather the simple and genial humor of the man, springing from the goodness of his heart, and the unassuming kindness of his disposition. To this engaging character of mind was added a pure and childlike religious faith. The hard muscular intellect had not built up its strength upon the ruins of the heart. It is related of him that he once chanced to be present at a discussion between two or three young men, upon the evidences of the Christian religion. They indulged freely in sneers, and at the end of the argument turned indifferently to the chief justice, whom they took, from his poor and plain costume, for some ignorant rustic, and asked him jocularly what he thought of the matter. "If," said the narrator of the incident, "a streak of lightning had at that moment crossed the room, their amazement could not have been greater than it was at what followed. The most eloquent and unanswerable appeal was made for nearly an hour, by the old gentleman, that he ever heard or read. So perfect was his recollection, that every argument used by the opponents of the Christian religion was met in the order in which it was advanced. Hume's sophistry on the subject of miracles was, if possible, more perfectly answered than it had been done by Campbell. And in the whole lecture there was so much simplicity and energy, pathos and sublimity, that not another word was uttered. An attempt to describe it would be an attempt to paint the sunbeams." This deep-seated religious faith never wavered. Marshall continued to repeat night and morning, in his serene old age, the prayer which he had been taught in the nursery at his mother's knee; and at a period when scepticism was fashionable among cultivated men, he never uttered a word calculated to throw doubt upon the divine origin of Christianity. A lesson of the deepest reverence for every thing holy was, on the contrary, taught by his daily life, and he died as he had lived trusting in the atonement of Jesus.—In terminating this sketch of the chief justice, we should not omit to record his affectionate and beautiful devotion to his wife. During her long and painful illness, which continued for many years, Judge Marshall seemed to think of nothing but her comfort, and the means of preventing her from suffering. There was a touch of chivalry in this dedication of every faculty to the ease of the excellent lady; and those who witnessed his devotion still speak of it as one of the most remarkable and affecting indications of his tenderness and goodness of heart.

MARSHALL, WILLIAM CALDER, a Scottish sculptor, born in Edinburgh in 1818. He studied under Chantrey and Baily, subsequently passed some years in Italy, and in 1889 took up his residence in London. His most successful ideal works are the "Dancing Girl Reposing," and "Sabrina." For the new houses of parliament he has executed statues of Clarendon,

Somerset, and Chaucer, and for the city of Manchester a colossal figure in bronze of Sir Robert Peel, beside a statue of Campbell to be erected by public subscription. His statue of Jenner was erected in Trafalgar square in 1859. He has executed comparatively few portrait busts. Since 1852 he has been a royal academician.

MARSHMAN, JOSHUA, D.D., an English missionary, born in Westbury-Leigh, Wiltshire, in 1767, died in Serampore, India, Dec. 5, 1837. In 1799 he was sent out to Serampore by the Baptist missionary society. He applied himself to the study of Bengalee, Sanscrit, and Chinese, and in 1826 visited England for the purpose of arranging certain differences between the missionaries and the missionary society; but his efforts were not successful, and he returned to India in 1829. His principal works are: a Chinese translation of the book of Genesis, the four Gospels, and the Epistles of Paul to the Romans and Corinthians; a "Dissertation on the Characters and Sounds of the Chinese Language;" "The Works of Confucius, containing the Original Text with a Translation;" "Clavis Sinica: Elements of Chinese Grammar," &c.; and "A Defence of the Deity and Atonement of Jesus Christ" (London, 1822), consisting of letters originally published in the "Friend of India," in reply to a work of the rajah Rammohun Roy, in which, while exalting the precepts, he had discredited the miracles of Christ. He assisted Dr. Carey in preparing a Sanscrit grammar and a Bengalee and English dictionary, and published an abridgment of the latter.

MARSI. I. An ancient people of Italy, of Sabellian race. They dwelt in the central Apennines, their territory surrounding Lake Fucinus (now Lago di Celano), between the land of the Sabines and Latium. Their principal town was Marruvium or Maruvium (San Benedetto), on the E. bank of the lake. Their origin is ascribed by some legends to Marsyas of Phrygia, and by others to Marsus, son of the sorceress Circe; the latter derivation may be owing to the circumstance of their having been acquainted with the medicinal qualities of some plants growing among the mountains of their territory, which were used as remedies against the bites of snakes. The Marsi enjoyed a great reputation for bravery among the Romans, against whom they fought in alliance with their neighbors, the Peligni, Marrucini, and other Sabellian tribes, in the latter part of the 4th century B. C., finally concluding a peace in 804. Having been for about 200 years the staunch allies of the republic, they became the prime movers of the great war known as the social or Marsic, waged for the right of the Roman franchise, which, though often defeated, they finally conquered by perseverance. It was proverbial among the Romans that "no triumph can be obtained over the Marsi or without them." II. An ancient people of Germany, on the banks of the Ems, probably a tribe of the Cherusci, with whom they fought under Arminius.

MARSIGLI, LUIGI FERDINANDO, count, an Italian soldier and savant, born in Bologna, July 10, 1658, died there, Nov. 1, 1730. He studied mathematics and natural history under Borelli and Malpighi, travelled in Turkey, afterward served in the imperial army, was wounded and captured by the Turks in the battle of Raab (1683), and after having been ransomed by his family was employed as boundary commissioner between Turkey and Austria. In the war of the Spanish succession, being second in command of the garrison of Brisach (1703) when that place surrendered to the French without offering any resistance, he was tried by an Austrian court martial and deprived of his rank in the army, although he gave evidence of the propriety of his conduct; the commander, Count Arco, was beheaded. Devoting himself henceforward to scientific pursuits, Marsigli published in 1726 his great work, *Danubius Pannonico-Mysicus*, of which a French translation appeared in 1744. He wrote several other works, among which is the "Military State of Turkey" in French and Italian. He presented his scientific collection to Bologna, where it served as a nucleus for an institute of sciences and arts; and his printing press, with an assortment of types for Latin, Greek, Hebrew, and Arabic, to the Dominicans of that city, on condition that they should print the works of the institute at cost.

MARSTON, JOHN, an English poet and dramatist, born about 1570, died about 1684. According to Anthony Wood, he was educated at Corpus Christi college, Oxford, after leaving which he was entered of the Middle Temple, London, where he was chosen lecturer in 1593. He was on terms of intimacy with Ben Jonson, to whom he dedicated, in 1605, his tragi-comedy, "The Malcontent." This intimacy did not however continue, and in his introduction to his tragedy of "Sophonisba," he accuses Jonson of plagiarism of classic authors in his "Catiline" and "Sejanus." Associated with Jonson and Chapman in writing "Eastward Ho!" he was with them imprisoned for a short time by James I. on account of its reflections against the Scotch. Marston had little dramatic genius, but was remarkable for the spirit and pungency of his wit as a satirist. The most important of his works, beside those above named, are: "The Scourge of Villainy," "The Metamorphosis of Pigmalion's Image," "Antonio and Mellida," "Antonio's Revenge," "The Dutch Courtesan," and "Parasitaster." Of these, the first two are satirical poems, the 3d and 4th tragedies, and the rest comedies. Marston's works were first collected and edited with a memoir by J. O. Halliwell (8 vols., London, 1856).

MARSTON, WESTLAND, an English author, born in Boston, Lincolnshire, Jan. 30, 1819. He is the son of a dissenting minister, and received a legal education in the office of his uncle, a solicitor in London. Subsequently he relinquished the law for literature, and entered upon a successful career as a dramatic author. Among his best plays are the tragedies of "The Patri-

cian's Daughter," "The Heart and the World," "Strathmore," and "Philip of France," several of which possess poetic merits of a high order. He has also produced some comic dramas, and a volume entitled "Gerald, a Dramatic Poem, and other Pieces," beside occasional lyrics contributed to the periodicals. His latest publication is a novel entitled "A Lady in her Own Right" (8vo., London, 1860).

MARSTON MOOR, a large open plain about 8 m. distant from the city of York, England, where a decisive victory was gained by the parliamentary forces and the Scots, under Lord Fairfax and the earl of Leven, over the royalists commanded by Prince Rupert, July 2, 1644. The advance of the royalists toward York, which was invested by Fairfax, having compelled the latter to raise the siege, he retired to Marston Moor, where Rupert encountered him on the afternoon of July 2 with 25,000 men. The parliamentary army was of equal strength. The battle commenced with an ineffectual cannonade on both sides, after which a pause of two hours ensued, each army watching the other across a brook which separated them. At 7 o'clock in the evening the signal for close combat was given, and Rupert, who commanded the right wing of the royalists, falling with characteristic impetuosity upon the parliamentary left wing, routed it, and pursued the fugitives to the distance of several miles from the field. The parliamentary centre was in like manner driven back by the royalist infantry with great loss, and the fortune of the day seemed so desperate that the three parliamentary generals, Lord Fairfax and the earls of Manchester and Leven, fled in different directions. The imprudence of Rupert, however, on this as on subsequent occasions, ruined the cause in which he was embarked. That part of the parliamentary left consisting of Cromwell's brigade of ironsides and David Leslie's Scottish regiments, with some fugitives rallied by Sir Thomas Fairfax, taking advantage of the disordered condition of the cavaliers, who were scattered in pursuit or engaged in plundering the baggage of their enemies, charged them in a compact body with such vigor that in a few minutes the fortune of the day was changed. After a few brief shocks the royal army was driven from the field, and their artillery, consisting of 25 pieces, with upward of 100 colors and 1,500 prisoners, captured. The royalist loss in killed and wounded exceeded 2,000, and that of the parliamentary army was nearly as great. A few days afterward York surrendered to Fairfax, and the power of the parliament was permanently established in the north of England.

MARSUPIALS, an order of implacental mammals, all, with the exception of the American opossums, now confined to Australia and its archipelago. The name is derived from the presence of a more or less complete *marsupium* or abdominal pouch in the females for the protection of their immature young, supported by two supplementary bones attached to the an-

terior margin of the pelvis. The cerebral characters have been described under MAMMALIA, and the peculiarities of the marsupial lactation under KANGAROO. They have been divided into two sections, according to the character of their food, the phytophagous or plant-eating and the rapacious or carnivorous and insectivorous groups. The former are characterized by the small size or absence of canine teeth, the large incisors (never more than 2 in the lower jaw), and broad tubercular molars; they include the 3 families of *phascologydæ* or wombats, *macropodidæ* or kangaroos, and *phalangistidæ* or phalangers and koala. The 2d group have small and numerous incisors, 8 to 10 in the upper and 6 to 8 in the lower jaw, canines large and in both jaws, and pointed molars; they include the 4 families of *peramelidæ* or bandicoots, *didelphidæ* or opossums, *myrmecobiidæ* or Australian ant-eaters, and *dasyuridæ* or dasyures, the last the most carnivorous of all in habits and form. This order presents animals showing types of many of the placental orders; for instance, the phalangers call to mind the *quadrumana*, the dasyures the *carnivora*, the phascogales the *insectivora*, and the kangaroos the *edentata*. Australia is the great head-quarters of the marsupials, though they are found in its vicinity, and in America from the middle United States to Buenos Ayres, as well as on the W. coast of South America; those species in Australia nearly allied and with similar habits do not appear to be associated together in the same limited district. The connection between Australia and these animals seems to be in the dry nature of the country; a mother under ordinary circumstances could not leave her young to go in quest of water for 100 miles or more, without danger of finding them starved or destroyed on her return; the marsupial obviates the difficulty by taking her young along with her in the pouch.—The skull in marsupials presents the reptilian character of permanent separation of the bones, even in old animals; the palate is very imperfect, and the angle of the jaw bent inward; the number of teeth is greater than in placental mammals, and that of the incisors is never the same in each jaw; clavicles are present in most of the species; the marsupial bones, existing in both sexes, are considered by Owen as trochlear or sesamoid bones, developed in the tendon of the external oblique muscle of the abdomen as the knee-pan is in the tendon of the *rectus* of the thigh, the cremaster muscle winding around them in the male and the compressors of the mammary gland in the female; in many genera, like the *opossums*, the tibia and fibula are so loosely connected with each other and with the tarsus that the foot has a movement of rotation upon the leg, the inner toe acting as an opposable thumb. The brain is, relatively to the body, smaller in marsupials than in any other mammals, varying between 1 to 520 and 1 to 800; its structure is more simple, and its surface without convolutions or *corpus callosum*, and the intelli-

gence corresponds to this inferiority of cerebral development. The organs of smell, hearing, and other senses are well developed; the eyes are generally large and prominent, as most of them are nocturnal in their habits. There are 8 modifications of the stomach, it being simple as in the opossums and phalangers, with a glandular apparatus as in the koala and wombat, or sacculated as in the kangaroos (in the latter resembling in structure the human colon); these modifications do not appear to be related to the character of the food; in the genera with a simple stomach the cæcum is much developed, being sometimes 3 or 4 times as long as the animal, while it is very small in those with sacculated complex stomachs, showing the vicarious functions of these two portions of the alimentary canal; in the flesh-eating marsupials the intestine is suspended on a simple and continuous mesentery, as in carnivorous reptiles. The liver is divided into many lobes, and is always provided with a gall bladder; the pancreas and spleen are triangular or T-shaped; in the heart there is not the usual trace of the foetal communication between the auricles, on account of the early period at which the incompletely developed young begin to respire air. The lungs are constructed on the usual mammalian type, the only tendency to the oviparous structure being the entireness of the rings of the trachea in some of the phalangers; the kidneys present nothing unusual; the membranous portion of the urethra is longer and wider than in other mammals; the *vesicula seminales* are absent, and the glans sometimes double, with a corresponding duplication in the female organs; in these ovo-viviparous or implantal mammals the vascular layer of the allantois is not developed so as to organize the villi of the chorion or to form cotyledons or a placenta. For details on the anatomy, mode of development, and natural history of marsupials, the reader is referred to the article "Marsupialia," by Owen, in vol. iii. of the "Cyclopædia of Anatomy and Physiology," and to vol. i. of the "Natural History of Mammalia," by G. R. Waterhouse (London, 1846). Prof. Owen regards the koala as the most typical of the marsupials, having the greatest number of the modifications peculiar to the order, and the smallest number of those common to other groups of mammals. His classification of the order is into: 1, *sarcophaga* (flesh eaters), like *dasyurus*; 2, *entomophaga* (insect eaters), like the opossums; 3, *carpophaga* (fruit eaters), like the phalangers; 4, *poëphaga* (plant eaters), like the kangaroos; and 5, *rhizophaga* (root eaters), like the wombat.—The first traces of mammals on the globe are the fossil remains of marsupials in the Stonesfield oolite and the gypsum (eocene) of Paris, so that at those epochs Europe was inhabited by animals of a type now confined to Australia and America; similar fossils have been found in the caverns of Welling-ton valley, New South Wales, and in the calcareous caverns of Brazil by Dr. Lund, very nearly allied to species now living in those coun-

tries. The present occurrence of marsupials only in N. and S. America and in far distant New Holland, in connection with their fossil remains in both regions, has been used as an argument in favor of distinct local foci of creation, and against any unique centre of origin of existing mammals; the force of the argument, however, is weakened by the fact of the existence of marsupials in Europe (and perhaps in other countries) in former geological epochs.

MARSYAS, in Greek mythology, according to different traditions, a satyr or a peasant of Phrygia, son of Hyagnis, Cæagnus, or Olympus. A flute, which Minerva had thrown away in disgust at seeing the distortion of her features, as she played it, reflected in the water, was picked up by Marsyas. The breath of the goddess, having once filled it, caused it still to emit the most beautiful strains whenever he blew through it. He therefore ventured to challenge Apollo to a musical contest, and played the flute as Apollo played the lyre. The latter triumphed only by adding his voice to the music of his instrument. The condition was that the victor should do what he pleased with the vanquished, and Marsyas was bound to a tree and flayed alive. His blood was the source of the river in Phrygia, an affluent of the Mæander, which bore his name; and his flute, being borne down this river, was thrown on shore near Sicyon, and was there dedicated to Apollo in his temple. The legend is supposed to have reference to the contest between the citharædic and aulædic styles of music.

MARTEL, CHARLES. See CHARLES MARTEL.

MARTEN, a carnivorous animal of the weasel family, and genus *mustela* (Linn.), which includes also the fisher and the sable of Europe. The pine marten or American sable (*M. Americana*, Turton) is smaller than the fisher, being about 17 inches from the tip of the nose to the base of the tail, the latter being 10 inches to the end of the hairs; it is also less common and considerably more valuable. The general color is a rusty yellow, with a lighter head, almost whitish throat, and dark tints on the back, varying according to season, latitude, and locality; the tail is cylindrical, bushy, and comparatively short; the inner fur is ash-colored at the base, yellowish brown near the end, and in the best specimens tipped with dark brown or black; it is coarse and light-colored in the summer season and in low latitudes, but in the Hudson's bay and Lake Superior districts the winter fur is fine, long, lustrous, and darker, the tail generally the darkest. It is a shy, cunning, and very active animal, rarely approaching the haunts of man, preferring the dense pine woods of northern latitudes; it is carnivorous, pursuing its prey into trees. It is generally taken in winter in dead-falls, set about $\frac{1}{2}$ of a mile apart, and baited with a piece of meat or fish; the winter traveller in the mining region of Lake Superior, in following the Indian trails and even the mail routes, sees many of these traps containing the dead and frozen victims, and is not

unfrequently surprised at finding the mail carrier stop to clear and reset his traps, regardless of the additional day required for the transmission of the important mail matter. This marten is properly called the American sable, though the mink, an animal of inferior value (of the genus *putorius*, Cuv.), is by furriers erroneously called by this name; it is worth from \$2 to \$4 a skin, according to quality and color; it is sometimes dyed and sold as Russian sable, when of very fine quality. It has been questioned whether the pine marten of Europe (*M. martes*, Linn.) is the same as the American; it is probably a distinct species, and is so regarded by Prof. Baird. The northern limit in America, according to Richardson, is 65° N., where trees cease; the absence of trees, and consequently of the marten, according to Pennant, for 25 degrees of longitude on the Asiatic side of Behring's straits, is in favor of the non-identity of the two species; the same facts would add to the improbability of the true sable (*M. sibirica*, Linn.) being found in this country; the southern limit, according to Audubon and Bachman, is about 40°, and its range extends from the Atlantic to the Pacific. The European pine marten is grayish brown, with a yellow spot under the neck. The beech marten (*M. foina*, Linn.) has a white spot on the throat, the body more reddish and yellowish brown, the tail brownish black, and the downy fur of all parts of a lighter hue. The sable will be described under its proper title. The martens have one more carnivorous tooth than the polecats, and are less sanguinary in their habits, eating when pressed more vegetable food; they are generally wild, inhabitants of woods, climbing trees in pursuit of birds, squirrels, and other small animals; they are all more or less nocturnal, preferring cold and uninhabited regions; all are more or less valuable for their fur, that of the sable being most prized, next that of the pine marten of America, then of the common and beech martens of Europe, and last and least of the American fisher.

MARTENS, GEORG FRIEDRICH VON, a German diplomatist and publicist, born in Hamburg, Feb. 22, 1756, died in Frankfort-on-the-Main, Feb. 21, 1821. He became in 1784 professor of jurisprudence at Göttingen; was ennobled in 1789, and was employed in various public capacities, serving during the 5 years previous to his death as Hanoverian ambassador at the German diet. His reputation rests on his *Précis du droit des gens moderne de l'Europe*, and his *Recueil de traités*, the latter of which, with continuations by other writers, includes treaties of 93 years, from 1761 to 1854. He also wrote *Cours diplomatique, ou tableau des relations extérieures des puissances de l'Europe*, and several other kindred works.—His nephew, KARL VON MARTENS, has published *Causes célèbres du droit des gens*; *Nouvelles causes célèbres*; *Recueil manuel et pratique de traités*, &c.

MARTHA'S VINEYARD, an island lying

off the S. coast of Massachusetts, and forming the principal portion of Dukes co.; pop. 4,401. The Vineyard sound separates it from the mainland. It contains 3 towns, Edgartown, Chilmark, and Tisbury. Edgartown is 14 m. S. E. from Wood's Hole on Cape Cod, 25 m. W. S. W. from Nantucket, 30 m. S. E. by E. from New Bedford, and 85 m. S. S. E. from Boston. The island is 21 m. long and 6 m. in average breadth. It has considerable woodland. The surface is generally level, though there are elevations rising to the height of 150 feet above the sea. There are some manufactures, but the fisheries and shipping furnish to the people their chief employment. Martha's Vineyard was discovered by Bartholomew Gosnold in 1602, though he gave the name, not to the island which now bears it, but to a neighboring islet which is now called No Man's Land. In 1642 Martha's Vineyard was settled by Thomas Mayhew, who had been a merchant at Southampton, England. In 1644 it was placed under the jurisdiction of Massachusetts, and in 1664 it was transferred to New York, but was restored to Massachusetts in 1692. It suffered much during the revolutionary war from the British, who plundered it of 2,000 head of cattle.

MARTIAL (MARCUS VALERIUS MARTIALIS), a Latin epigrammatic poet, born in Bilbilis, Spain, March 1, A. D. 48, died near the same place in or after 104. Little is known of his history except from his works, the younger Pliny being the only contemporary author who mentions him. He went to Rome in 66, resided there 35 years, and then returned to Bilbilis, where he lived at least 8 years. While in Rome the fame of his epigrams caused them to be sought not only in the capital, but also in Gaul, Germany, and Britain; he enjoyed the patronage and favor of the emperors Titus and Domitian; was raised to the rank of tribune and of knight; and possessed a mansion in the city, and a villa near Nomentum. His extant works consist of more than 1,500 short poems, in 14 books, bearing the general title of *Epigrammata*. The last two books, consisting of 350 disticha, are named respectively *Xenia* and *Apophoreta*. Still another book, containing 88 epigrams on the public shows, and bearing only in late MSS. the title of *De Spectaculis*, is attributed to him. The term epigram had previously been applied to any brief metrical effusion of whatever character, on whatever subject, and thus to the whole mass of the Greek anthology. Martial was the first to limit its meaning to a short poem, abounding in ingenious and pointed thoughts, all of which converge to a pithy and striking conclusion. He displays a singularly fertile fancy, a pungent wit, and refinement and delicacy of diction. No author has furnished a more full and minute delineation of Roman customs and social habits during the first century of the empire. But the adulation which he lavishes upon Domitian, and the obscenity in which he delights, prevent his character from commanding respect. The best editions are

those of Lemaire (8 vols., Paris, 1825) and Schneidewin (Grimma, 1842). Selections from his epigrams have been translated by various English poets. The only complete version is that by various authors in Bohn's "Classical Library" (London, 1860). Ramler translated Martial into German.

MARTIAL LAW is often confounded with military law; but these terms are by no means convertible. Military law, beside some customary law, consists chiefly of the articles of war; that is to say, of the code enacted by the supreme legislative authority, as in England by parliament and in the United States by congress, for the government of the army and navy. It embraces, also, the body of rules and regulations which are prescribed from time to time by competent military authority, for the preservation of the general discipline and order. Military law does not supersede the general municipal law. It is rather a branch of it, more limited, indeed, in the range of its application than the admiralty or the chancery law, for example, yet having a like authority with them. In this country, unlike some of the states of continental Europe, the application of military law to the soldier is not exclusive of, but coördinate with, the general civil law. Every soldier, as a citizen, is subject to the common law of the land; but as a soldier he is amenable to the military law. The special tribunals which administer this law are named courts martial, and hence, perhaps, has arisen in part the confusion of the military law with the law martial. (See COURT MARTIAL.) Martial law is, says Blackstone, in fact no law at all. Yet Stephen, an eminent commentator, defines the law as that, whatever it may be, which is imposed by the military power; and says that, if it exist at all now in the institutions of England, it is identical with the articles of war. So in his "Law Dictionary" Bouvier says martial law is a code established for the government of the army and navy. Its principal rules are to be found in the articles of war. Its object is to subject the whole military body to certain rules of discipline, essential to energetic and effective action, and violations of it are to be tried by courts martial. These authorities define very well military, and in a certain sense, but not well, martial law. A clearer idea is that furnished by an old writer, Smith, who in his "English Republic" says: "Martial law is the law of war, that depends on the just but arbitrary power and pleasure of the king. For, though he doth not make any laws but by common consent in parliament, yet in time of war, by reason of the necessity of it, to guard against dangers that often arise, he useth absolute power; so that his word is a law." However opposed to other authorities, this expresses what is distinctively meant both in England and in this country by martial law. When in time of extreme peril to the state, either from without or from within, the general safety cannot be trusted to the ordinary administration, or the

public welfare demands the adoption and execution of extraordinary measures, it may become necessary to declare the existence of martial law. This is, indeed, no law at all in its ordinary sense; it is in fact the abrogation of it. That which is done under martial law has not an immediate constitutional or legislative sanction, as the military or the statute law, for example, has. It proceeds directly from the military power, which has now become supreme. Yet remotely and indirectly martial law expresses the will of the people. The supreme court of the United States has held that a state legislature may proclaim its existence whenever the public safety demands it; and the constitution, by implication at least, also permits its proclamation by that clause which provides that the privileges of the writ of *habeas corpus* shall not be suspended, unless when, in cases of rebellion or invasion, it is essential to the general welfare. The right to judge whether the exigency has arisen belongs, it seems, exclusively to congress. So in England martial law and its incident, the suspension of the writ of *habeas corpus*, require the authority of parliamentary acts to give them a constitutional existence.

MARTIN, an American bird, the largest of the swallow family, belonging to the genus *progne* (Boie). The bill is strong and short, with a very wide gape and curved culmen; the wings lengthened, the 1st quill the longest; the tail moderate, but considerably forked; tarsi shorter than the middle toe and robust; the toes long and strong, the lateral ones equal, with curved claws. The best known is the purple martin (*P. purpurea*, Boie), generally distributed over North America; the length is $7\frac{1}{2}$ inches, the extent of wings 16, and the bill along the gape 1 inch; the general color is glossy steel blue, with purple and violet reflections; the female and young are less brilliant, and pale brownish below with darker and bluish blotches; the bill brownish black; the closed wings are rather longer than the tail, and the tarsi and toes are naked. Martins appear in Louisiana early in February in large flocks, in the middle states from the middle of March to the 10th of April, in New England about the 25th of April, and further north at a later period, departing for the south again about the 20th of August in immense flocks and all at once at the dawn of some calm morning. The flight is graceful, easy, and swift; they are expert in catching their insect prey, in bathing and drinking while on the wing, and in performing aerial evolutions to the annoyance of their bird enemies; they are very bold, and hesitate not to attack crows and hawks, which from their superior powers of flight they drive away; even the fierce little king bird (sometimes called field martin), with similar fighting propensities, has to yield to the strong and swift martin; they perch easily upon trees, and, notwithstanding the shortness of their legs, walk well upon the ground. From their attacking cats, dogs, and all flying marauders of the farm yard, they

are great favorites, and are provided with elevated boxes for rearing their young in most towns of the United States; these harbingers of spring are much attached to their breeding places, and return to the same year after year; in the absence of a box, they build in any crevice or hole in a tree; the mischievous boy, the industrious farmer, the Indian, and the slave, all respect the martin, and delight in his merry twitter. The nest is made of leaves, twigs, grasses, feathers, and other soft materials, and generally contains 4 to 6 pure white eggs; many pairs breed in the same box in perfect harmony; two broods are generally reared in a season; the males assist in incubation. The food consists of wasps, bees, beetles, and other insects, though they seldom seize the honey bee. In England some of the swallows are called martins; these, as the house martin (*cotyle vrbica*, Boie), and the sand or bank martin (*C. riparia*, Boie), will be noticed under SWALLOW.

MARTIN. I. An E. co. of N. C., bounded N. by the Roanoke river; area, 420 sq. m.; pop. in 1850, 8,807, of whom 8,867 were slaves. The surface is level and the soil generally sandy. The productions in 1850 were 267,477 bushels of Indian corn, 2,860 of wheat, and 89 bales of cotton. There were 12 grist mills, 2 saw mills, 11 shingle mills, 10 churches, and 900 pupils attending public schools. Capital, Williamston. II. A S. W. co. of Ind., drained by the E. fork of White river and by Lick creek; area, 340 sq. m.; pop. in 1850, 5,941. The surface is hilly and the soil moderately fertile. The productions in 1850 were 8,423 bushels of wheat, 251,700 of Indian corn, 82,650 of oats, and 14,569 lbs. of wool. There were 6 churches, and 820 pupils attending public schools. The Ohio and Mississippi railroad intersects the county. Capital, Dover Hill.

MARTIN, ALEXANDER, an American soldier and statesman, born in New Jersey about 1740, died in Danbury, Rockingham co., N. C., in Nov. 1807. He was educated at the college of New Jersey, and after settling temporarily in Virginia, removed in 1772 to Guilford co., N. C. He soon after became a member of the colonial assembly, participated in the assemblies of the people which met in 1774-'5 to vindicate their rights, and in 1776 was appointed colonel of a regiment of the continental line, with which he fought at Brandywine and Germantown. At the conclusion of the war he reentered the general assembly of North Carolina, of which he became speaker. In 1782 he was elected governor of the state, and again in 1789, having in the interval been a member of the convention which framed the federal constitution; and from 1798 to 1799 he filled the office of U. S. senator from North Carolina. The degree of LL.D. was conferred upon him by the college of New Jersey, and at the time of his death he was a trustee of the university of North Carolina.

MARTIN, BENJAMIN, an English optician and author, born in Worpleston, Surrey, in 1702,

died in London, Feb. 9, 1782. He commenced life as a ploughboy, and by a rigid course of self-education acquired a considerable knowledge of mathematics and of various branches of physical science. In 1735 he settled at Chichester as a schoolmaster, and lectured on mathematics, and subsequently removed to London, where for many years he carried on an extensive trade as an optician and maker of globes. In the latter part of his life he became involved in pecuniary difficulties through the misconduct of his son, and in a fit of mental alienation attempted to destroy himself. The wound inflicted on this occasion, though not immediately mortal, hastened his death. Among his numerous publications are a "Philosophical Grammar," "Description and Use of both the Globes, the Armillary Sphere, and Orrery," "Elements of Geometry," "Panegyric of the Newtonian Philosophy," "New Elements of Optics," "Mathematical Institutions," "Natural History of England," "The Philosophical Magazine," which was continued to the 14th volume, &c.

MARTIN, BON LOUIS HENRI, a French historian, born in St. Quentin, Feb. 20, 1810. He was educated at the college of St. Quentin, and in 1830 commenced his literary career by the publication of *Wolfthurn*, a romance, written in conjunction with his friend Félix Davin. It was followed by a series of historical novels illustrating the period of the Fronde, and in 1833 Martin undertook, in conjunction with several coadjutors, a "History of France by Leading Historians," a work intended to embrace within its scope extracts, chronologically arranged, from the principal chroniclers and historians. One by one the contributors dropped off, until Martin was left to conduct the publication alone. Tiring of this occupation, he determined to substitute for the work an original history, of which the first edition, under the title of *Histoire de France*, appeared in 1838-'6 (15 vols. 8vo.). The subject thenceforth became the engrossing labor of his life. Scarcely was the last volume of this edition issued from the press when he commenced a revision of the whole work on a more comprehensive plan, which occupied him 17 years, during which a 2d edition of the original work was also published. Of the 19 volumes of the second work, which appeared at irregular intervals, several have been honored with peculiar distinctions, the 10th and 11th, devoted to "Religious Wars," having received the first Gobert prize of the academy of inscriptions, and the 14th, 15th, and 16th, relating to the reign of Louis XIV., the second Gobert prize from the French academy, and after the death of Thierry, the first. Since the completion of the second revision Martin has published a third and more elaborate one, embracing the most recent discoveries in Celtic antiquities, and in ancient and mediæval history, religion, language, and literature (16 vols., 1855-'61). For a short period in 1848 M. Martin occupied the chair of modern history at the Sorbonne, and at various times he has contributed

historical and political articles to the leading periodicals of Paris.

MARTIN, DAVID, a French Protestant divine, born in Revel in 1639, died in Utrecht, Holland, in 1721. He was admitted to the ministry in 1683, emigrated to Holland after the revocation of the edict of Nantes, and about 1686 became pastor and professor of theology and philosophy in Utrecht, where he passed the remainder of his life. He was an eminent biblical scholar, and published a celebrated "History of the Old and New Testament" (2 vols. fol., Amsterdam, 1707), embellished with 420 fine engravings, and known as "Mortier's Bible," editions of the Bible with notes, a treatise on revealed religion, and many minor works.

MARTIN, FRANÇOIS XAVIER, an American jurist and author, born in Marseilles, France, March, 17, 1764, died in New Orleans, La., Dec. 11, 1846. At the age of 18 he emigrated to Martinique, where he engaged in business. Various mishaps attended his efforts, and about 1786 he found himself in Newbern, N. C., whither he had gone to look after a cargo of molasses, friendless and penniless. Unwilling to return to France under these circumstances, he took up his residence in Newbern, and supported himself by teaching French. He also learned printing and established a newspaper, the copies of which he peddled through the adjoining counties; and subsequently he published school books, almanacs, translations of French works, &c. A year or two after his arrival in North Carolina he commenced the study of the law, and about 1789 was admitted to the bar, of which he soon became a leading member. At the same time he pursued his avocation of printer, and in the intervals of his practice prepared and published brief treatises on the duties of sheriffs, of justices of the peace, and of executors and administrators. At a later period, at the suggestion of the legislature, he prepared a compilation of the British statutes in force in North Carolina at the period of the revolution, together with a digest of the statute laws of the state, and a translation of "Pothier on Obligations," which, published in 1802, was rendered directly from the French into English type in the composing stick. His researches into the statute law also suggested to him the idea of collecting materials for a history of North Carolina, which was published, chiefly in the form of annals, in 1829 (2 vols. 8vo., New Orleans). He also prepared a series of reports of the decisions of the higher courts of the state, now the oldest volumes of that character received as authority in the courts of North Carolina. After 20 years' practice in North Carolina, he was appointed by President Madison, soon after his accession to office, one of the judges of the territory of Mississippi, which position he filled for a year, when he was transferred to the bench of the territory of Orleans. The unsettled state of the law in the territory at that time, owing to the defective character of the civil code adopted in 1808, and to the

confusion resulting from engrafting certain principles of the common law upon the system of civil law then in vogue, rendered the office of judge one of peculiar difficulty. Judge Martin, however, by his incessant and well-directed labors in reconciling these discordant elements of law, acquired the title of the father of the jurisprudence of Louisiana. In Feb. 1818, soon after the formation of the territory of Orleans into the state of Louisiana, he was appointed its attorney-general; and in Jan. 1815, he was advanced to the bench of the supreme court, of which he remained a justice until near the close of his life, a period of 32 years. During nearly his whole judicial career he was troubled with defective eyesight, and for the last 10 years of his life was almost entirely blind. He nevertheless discharged his duties with perfect regularity and to the public satisfaction. He continued his occupation of reporter after his elevation to the bench, and published reports of the superior court of Orleans from 1809 to 1818 (2 vols.), and reports of the supreme court of Louisiana from 1818 to 1830 (18 vols.), beside a digest of the territorial and state laws in French and English (2 vols.), prepared under a resolution of the legislature. He also published a history of Louisiana, from its settlement to the treaty of Ghent in 1814 (2 vols. 8vo., 1827), which is of a character similar to his history of North Carolina. His will, written by himself on a half sheet of paper, and devising his large property to his brother, was unsuccessfully contested by the state on the ground that such an instrument could not be written by a blind man. As a jurist his reputation is widely extended in the United States, and he received the degree of LL.D. from Harvard college and Nashville university. In private life he was upright, amiable, and frugal.

MARTIN, JOHN, an English painter and engraver, born near Hexham, Northumberland, July 19, 1789, died in Douglas, Isle of Man, Feb. 9, 1854. Manifesting a taste for painting, he was apprenticed to a coach maker to learn herald painting, and subsequently to an Italian artist named Musso, with whom he removed in 1806 to London. He gave great attention to perspective and drawing, and for several years after his marriage, which took place in 1808, supported himself by painting on china and glass, and teaching. Resolving to bring himself into notice by some large work, he produced in 1812, after a month's labor, "Sadak in Search of the Waters of Oblivion," which found a place in the exhibition of the royal academy and a purchaser at 50 guineas. It was followed by the "Expulsion from Paradise" and by "Clitie" and "Joshua." The last two being hung in an ante-room at the academy exhibition, the artist was so displeased that he withdrew his name from the list of candidates for membership. His "Joshua" was soon after placed in a prominent position at the British institution, and received the prize of the year. During the next 10 years he appeared before the public in a series of works conceived in a peculiar style,

and among the most popular art productions of the day. Prominent among these were the "Fall of Babylon" (1819); "Macbeth" (1820); "Belshazzar's Feast" (1821), which obtained the premium of £200 from the British institution; the "Destruction of Herculaneum" (1822); the "Seventh Plague" (1823); the "Creation" (1824); the "Deluge" (1826); and the "Fall of Nineveh" (1828). Mezzotint engravings of them, executed by the artist and disseminated by many thousands, added to their reputation, and have still a considerable degree of popularity. Martin subsequently relinquished painting for a number of years, devoting himself in the interval to designing and engraving a set of illustrations for Milton, for which he received 2,000 guineas, and to projects for improving the city of London, a subject on which he labored much during the last 20 years of his life. About 1838 he resumed his pencil, and worked industriously until a few weeks before his death. His last productions, 8 large pictures, intended to be his masterpieces, and entitled "The Last Judgment," "The Day of Wrath," and "The Plains of Heaven," were, though left unfinished, exhibited in the United States in 1856.

MARTIN, LOUIS AIMÉ. See AIMÉ-MARTIN.

MARTIN, MARGARET (MAXWELL), an American authoress, born in Dumfries, Scotland, in 1807. She came to America in 1815 with her parents, who settled in Fayetteville, N. C., but soon removed to Columbia, S. C., where she has since most of the time resided. For more than 17 years she taught a large female seminary in Columbia. In 1836 she married the Rev. William Martin, of the Methodist Episcopal church, and shared with him the life of an itinerant missionary. During her travels she employed herself in exploring and recording local traditions, and thus gathered materials for a large number of interesting and instructive papers which she communicated to the press. She has also written several volumes in prose and verse, chiefly of a devotional character. Among her publications are: "Day-Spring;" "Methodism, or Christianity in Earnest;" the "Sabbath-School Offering," a collection of poems and true stories; and two volumes of poetry, "Religious Poems" and "Flowers and Fruits." The Rev. Mr. Martin is now the president of the female college in Columbia, and she shares with him the labors of instruction.

MARTIN, SARAH, an English philanthropist, born at Caistor, near Yarmouth, in 1791, died in Yarmouth, Oct. 15, 1848. Her opportunities of early education were meagre, and at the age of 14 she learned the trade of dressmaking, which she followed for many years. She had taken an interest in the miserable condition of the inmates of the county gaol, and in 1819 this interest was quickened into active effort by the imprisonment of a woman for cruelty to her own child. An interview with the culprit demonstrated to her the necessity of prison visiting; and she repeated her visits, reading the Scriptures and good books to the prisoners, and

conversing with them kindly and familiarly. After a while she spent each Sunday morning with them, conducting a religious service there, as no one else would do so, and presently added an afternoon service also. She gave up, soon after, one day in the week to the prisoners, though she could ill afford it; and by the aid of friends procured for them more comfortable clothing, books for instruction and for a library, and materials for work. In 1826, on the death of a relative, she came into possession of an annual income of from \$50 to \$60, and thenceforth devoted herself entirely to her missionary work. She provided employment for prisoners after their discharge, where they could be under her supervision; instructed those still in prison in elementary studies for an hour or two each day; organized a large school in the work-house, which she managed with great skill and success; devoted two evenings in the week to a school for factory girls which she originated, and on the other evenings visited the sick and the poor. Without entering into, or perhaps understanding fully, the theories of prison reform, she had put in practice every one of those measures which the most eminent authorities now agree in considering desirable; and this without counsel from others, without superior education, and with limited means. Though plain in appearance, she possessed a power of controlling the most turbulent and vicious; and she records the fact in her journal, that she never found a prisoner obstinate in his opposition to her plans, or long indifferent to her wishes.

MARTIN, WILLIAM D., an American lawyer and politician, born in Martintown, Edgeworth district, S. C., Oct. 20, 1789, died in Charleston, Nov. 16, 1833. He completed his legal studies at Litchfield, Conn., where he accumulated 8 folio volumes of original notes upon the lectures. He practised his profession in Edgefield, Coosawhatchie, and several other courts, and in 1816 was elected a representative in the legislature of South Carolina. In 1818 he was made chairman of the judiciary committee and clerk of the state senate, and in 1826 was elected a representative in congress. Reputed one of the ablest jurists and advocates of South Carolina, he became in 1830 a judge of the circuit court; and his judicial decisions added to his reputation for learning and ability. As a statesman he belonged to the ultra states' rights school, and was prominent in maintaining the principle of nullification. He was found dead in his bed at Jones's hotel, Charleston.

MARTINEAU, HARRIET, an English authoress, born in Norwich, June 12, 1802. She is descended from French ancestors, who left their country on the revocation of the edict of Nantes and established themselves at Norwich, where her father was a manufacturer of bombazines. In spite of rather straitened circumstances, Mr. Martineau gave his children a sound and liberal education; and at an early age Harriet, who had been afflicted from childhood with a constantly increasing deafness and a total lack of

the sense of smell, found her chief recreation in literary composition. Pecuniary disasters soon taught her to rely upon her pen for support. In 1823 she published "Devotional Exercises for the Use of the Young," and in 1824 a tale entitled "Christmas Day," a sequel to which, "The Friend," appeared in 1825. Encouraged by the success of these works, she produced in the following year "Principle and Practice," "The Rioters," and "Original Hymns;" and in 1827-'8 "The Turn-Out," "Mary Campbell," "My Servant Rachel," a "Sequel to Principle and Practice," and a series of "Tracts" on questions relating to the working classes, in whose welfare several of her previous writings had betrayed a strong interest. In 1831 she published, under the title of "Traditions of Palestine," a series of sketches of the Holy Land during the period of Christ's ministry. In the same year she obtained prizes from the British and foreign Unitarian society for 3 tracts on "The Faith as Unfolded by many Prophets," "Providence as Manifested through Israel," and "The Essential Faith of the Christian Church." About this time she conceived the plan of issuing a series of monthly stories illustrating the leading principles of political economy, an idea which she had borrowed from Mrs. Marcet's "Conversations" on the same subject. The society for the diffusion of useful knowledge, to which she at first applied, refused to enter into the project, and it was only after many rebuffs and disappointments that she succeeded in finding a publisher. The immediate and remarkable success, however, with which the first tale was received, repaid the authoress for her perseverance. The series extended to 24 stories, which were many times reprinted and translated into French and German, and which fixed her reputation as an earnest thinker and a writer of fiction of no common abilities. The "Illustrations of Taxation" and "Poor Laws and Paupers," which next appeared, were written with the same plan, and also published serially. In Aug. 1834, Miss Martineau sailed for America, and travelled extensively in the United States, where she was the object of many attentions. She visited nearly all portions of the country, and on her return in the summer of 1836 recorded her impressions of American life and institutions in a work entitled "Society in America" (1837), which provoked some unfavorable comment in the United States, but was generally praised for its honesty and candor. Having been solicited to communicate more of her personal narrative and incidents of travel than it suited her purpose to give in this work, she published in 1838 her "Retrospect of Western Travel." In the following year appeared "Deerbrook," her first and most popular novel; and about the same time she wrote "The Hour and the Man" (a work of fiction founded on the career of Toussaint l'Ouverture), and a series of tales for children entitled "The Playfellow," among which were "The Settlers at Home,"

"Feats on the Fiord," and "The Crofton Boys." Her health, which had been delicate from childhood, now became so seriously affected that from 1839 until 1843 she was obliged to desist from all literary occupation. In the latter year she published "Life in the Sick Room." In 1844, having lost all hope of a restoration to health by the ordinary methods, she resolved to try the agency of animal magnetism; and the result, as described by herself in the "Athenæum" literary journal, was a speedy restoration to perfect physical and mental health. The circumstance attracted much notice on both sides of the Atlantic, and Miss Martineau's narrative was reprinted in pamphlet form in New York. She at once resumed her literary activity, and published her "Forest and Game Law Tales," and "The Billow and the Rock." In 1846, in company with her friends Mr. and Mrs. Richard V. Yates, she undertook an oriental tour, of which an account appeared in 1848 in her "Eastern Life, Past and Present." Her next important publication was a continuation of the "History of England during the 80 Years' Peace, 1816-1846," begun by Mr. Charles Knight, but of which only the first book had appeared. The work was issued in 2 vols. 4to. in 1849 and 1850; and in 1851 Miss Martineau added to it an "Introduction" in 1 vol. In the same year she gave to the world her correspondence with Mr. H. G. Atkinson on "The Laws of Man's Nature and Development," which abounds in curious revelations of her own psychological experiences, and manifests a decided leaning toward the principles of Comte. Her philosophical views were still more plainly set forth in 1853 by a condensed version of Comte's "Positive Philosophy." Among Miss Martineau's other writings are: "Five Years of Youth;" "How to Observe," a work for travellers, published in "Knight's Series;" "The Maid-of-all-work;" "The Housemaid;" "The Lady's Maid;" "The Dressmaker;" "Household Education," originally contributed to "The People's Journal;" a "Complete Guide to the Lakes" (1854); "The Factory Controversy" (1855); and "Local Dues on Shipping" (1856). Her last work is "England and her Soldiers" (1859). She is a frequent contributor to some of the leading magazines, "Once a Week," and other periodicals, and to the editorial columns of the London "Daily News." She takes a deep interest in all questions of reform, and has written much on slavery, toward which her works on America evince a strong hostility. Miss Martineau now resides in a cottage built by herself near Ambleside. She has twice refused on conscientious grounds the offer of a pension from government.

MARTINEAU, JAMES, brother of the preceding, an English Unitarian clergyman, born in Norwich about 1805. He studied at the Unitarian college in York, and was settled successively over chapels in Dublin and in Liverpool. In 1858 he was called to the chair of moral and metaphysical philosophy in Man-

chester New college, Gordon square, London, and in 1858 to the joint pastorate with the Rev. John James Tayler of the principal Unitarian chapel in Little Portland street. The British "Quarterly Review" speaks of him as the foremost representative at once of Unitarianism within the pale of the Unitarian church, and of several analogous modes of belief outside the pale of that body. A writer in the "Scotsman" says: "Every sermon he delivers is a carefully written and well digested essay, which it requires the closest attention thoroughly to appreciate and understand. Calm, grave, and ascetic-looking, past middle life, of a gray, bloodless complexion, his black hair is still profuse and unsilvered. . . . In one of his epigrammatic sentences, we heard him, in describing man as distinguished from the lower animals, say that man reasons about reason, and thinks about thought; a sentiment true of all, and *par eminence* of himself, than whom there are few more acute thinkers in England." Mr. Martineau, in conjunction with two clergymen of Liverpool, the Rev. Messrs. Thom and Henry Giles, was engaged in a discussion by alternate public lectures with 18 clergymen of the church of England, on the Trinity, total depravity, atonement, and kindred doctrines. These lectures were afterward collected and published in 2 volumes, entitled "Unitarianism Confuted," and "Unitarianism Defended." Mr. Martineau was the author of 5 lectures in the latter volume. His other works are: "The Rationale of Religious Inquiry" (12mo., London, 1839); "Endeavors after the Christian Life" (2 vols. 8vo., London, 1848); "Miscellanies," edited by the Rev. Thomas Starr King (Boston, 1852); "Studies of Christianity," edited by the Rev. William R. Alger, and published by the American Unitarian association (Boston, 1858); and many articles in the "Westminster," "National," and other English reviews and journals.

MARTINEZ DE LA ROSA, FRANCISCO, a Spanish statesman and poet, born in Granada, March 10, 1789. He took an active part in his country's war of independence, familiarized himself while in England with the working of constitutional forms of government, and was elected member of the cortes in 1812. After the return of Ferdinand in 1814 he was imprisoned, on account of his liberal opinions, in the fortress of Penon on the coast of Morocco, until 1820, when the revolution of that year restored him to liberty. He was appointed secretary of state, but the moderation of his views failed to give satisfaction to any of the extreme parties; and after the subversion of the constitution by French interference, he left Madrid and spent a number of years in Paris, engaged in literary pursuits. After the revolution of July, 1830, he was permitted to return to Spain; and being appointed prime minister by Maria Christina in March, 1834, he promulgated the famous *estatuto real*, or the new constitution, which virtually abrogated that of 1812. The revolt of the Basque provinces led him to with-

draw from the administration; the old constitution was restored, and in 1840 Maria Christina's government was overthrown, and Espartero came into power. Martinez de la Rosa retired to Paris, where he was for some time ambassador; and afterward (1842-'8) he resided in the same capacity in Rome. After the fall of Espartero he joined Narvaez's cabinet, and remained in office with him until 1846. From 1847 to 1851 he was again ambassador to Paris and Rome. Subsequently he returned to Madrid, where he was chosen to the presidency of the senate, which he still holds. In Oct. 1857, he joined the Armero-Mon administration; and by royal decree of July 14, 1858, he was appointed president of the council of state, which office he still retains. He officiates at the same time as president of the board of education, and as secretary of the academy. He is the author of several novels and lyrical poems, which latter are highly esteemed. The most popular of his many dramas is the "Conspiracy of Venice." He has written also a review of the era of the French revolution (*Espíritu del siglo*, 10 vols., Madrid, 1835-'41), which is modelled after the revolutionary history of M. Thiers. The best edition of his miscellaneous works is contained in Baudry's *Bibliothèque Espagnole* (6 vols., Paris, 1844-'6).

MARTINI, GIAMBATTISTA, an Italian composer and author, born in Bologna in 1706, died Aug. 3, 1784. He early entered the order of Franciscans, visited Asia, and on his return devoted himself to music, being appointed chapel-master to a Franciscan convent in Bologna, which situation he filled during the remainder of his life. He was an industrious composer of church music, and published two musical treatises, an "Essay on Counterpoint," and a "History of Music" (3 vols. 4to., 1757-'81). He collected a remarkable library of musical works, numbering 17,000 volumes.

MARTINIQUE, or MARTINICO, one of the French West India islands, belonging to the Windward group, lying between lat. 14° 28' 43" and 14° 52' 47" N., and long. 60° 50' and 61° 19' W., 30 m. S. E. from Dominica and 20 m. N. from St. Lucia; length 45 m., breadth from 10 to 15 m.; area, 380 sq. m.; pop. in 1851, 123,701; in 1858, 126,460. The island is irregular in form, high, rocky, and volcanic, containing 5 or 6 extinct craters, one of which is of enormous dimensions. In the interior are 8 mountains, the highest of which, Mont Pelée, in the N., 4,438 feet above the sea, after a long period of inaction, burst forth in a violent volcanic eruption in Aug. 1851. From these mountains several ranges of low volcanic hills extend to the sea, and between them lie broad, fertile valleys. The rivers are numerous, but all small; most of them in the rainy season become fierce torrents. The coasts are indented by many bays, which are difficult of access. The E. side of the island, called Oubé-Terre, is more broken and sterile than the W., called Basse-Terre. About one third of the surface is under cultivation, the principal productions being sugar,

coffee, cotton, cassia, manioc, bananas, indigo, maize, cacao, and ginger. The climate is humid, and the average annual fall of rain is 84 inches. The year is divided into two seasons, one commencing about Oct. 15 and lasting 9 months, and the other comprising the rest of the year. During the latter season the rains are abundant, and yellow fever and similar diseases prevail. The mean annual temperature of the plains is 81° F. The annual value of the agricultural produce is about \$2,500,000, and the number of cattle is 150,000. The manufactures of Martinique possess considerable importance; there are several establishments for the preparation of indigo, about 100 for the various processes in the preparation of sugar, coffee, cocoa, and cotton, 6 potteries, 65 lime kilns, and 55 steam mills. There is an active commerce, chiefly with France. The principal exports in 1857 were 57,383,880 lbs. of sugar, 125,435 of coffee, 299,902 of cocoa, 180,695 of cassia, 186,807 of logwood, 4,594 of cotton, and 1,120,870 galls. of rum. The value of exports in 1855 amounted to \$4,126,792, and that of imports to \$3,981,715; revenue, \$364,434; expenditure, \$363,434. In 1858 the aggregate value of the import and export trade of France with Martinique was \$8,000,000. The average in the 5 preceding years was \$7,000,000.—The government is exercised by a governor, a privy council of 7 members, and a colonial council of 80 members elected for 5 years. The judiciary consists of a supreme court, and 2 assize and 2 inferior courts. The capital is Fort Royal, but St. Pierre is the largest town and the chief seat of commerce.—Martinique, called by the Indians Madiana, was discovered by Columbus in 1493. The French colonized it in 1635, and during the war of American independence made it a great naval station. The British wrested it from them in 1794, and restored it in 1802; took it again in 1809, and surrendered it in 1815. In 1819 it was ceded to Sweden, but the transfer was never actually effected. Slavery was abolished in Martinique in 1848.

MARTIUS, KARL FRIEDRICH PHILIPP VON, a German naturalist and traveller, born in Erlangen in 1794. He was graduated as a physician at the university of his native town, and from 1817 to 1820 accompanied Spix to Brazil, as botanist of the expedition which had been despatched under the auspices of the Austrian and Bavarian governments for the scientific exploration of that country. The result of his observations is embodied in his *Reise nach Brasilien* (3 vols., Munich, 1824-'31), a work which, both on account of its literary merits and of its fulness of information on the ethnology, geography, statistics, and general natural history of Brazil, belongs to the first class of scientific works of travel. Spix furnished some materials for the preparation of the 1st volume. A series of his subsequent works is devoted exclusively to the botany of Brazil, the herbarium which he brought back to Germany including over 7,000 species of plants. He has

devoted 27 years to the study and collection of palms, and his *Genera et Species Palmarum* (3 vols., Munich, 1823-'45, with 219 illustrations) contains a comprehensive description of the whole family of palms, and is considered the most magnificent contribution to botanical literature of modern times. His *Flora Brasiliensis* has appeared in Stuttgart since 1829, and is continued under his direction, with the co-operation of several eminent botanists. Martius has officiated for several years past as professor and director of the botanic garden at Munich, and both as a writer and teacher he has contributed powerfully in promoting the knowledge of natural history, especially of that of South America.

MARTOS, IVAN PETROVITCH, a Russian sculptor, born in Ichnia about 1755, died April 17, 1885. He studied his art in Rome, where he was maintained at the expense of the empress Maria Fedorovna, and ultimately became director of the academy of fine arts in St. Petersburg, and the most eminent Russian sculptor of his time. Among his chief works are the colossal bronze statues of the patriots Minin and Pozharsky at Moscow, the monument to the emperor Alexander at Taganrog, and that of Potemkin at Cherson.

MARTYN, HENRY, an English missionary, born in Truro, Cornwall, in 1781, died in Tokat, Asia Minor, Oct. 16, 1812. He was educated at St. John's college, Cambridge, where he obtained a fellowship in 1802. About this period the sudden death of his father turned his thoughts to religion. He resolved to become a missionary, and in 1805 set sail for India under the auspices of the African and eastern missionary society. He travelled for several years in India and Persia, preaching the gospel, and studying the native languages with such success that he was chosen to superintend the translations of the New Testament undertaken by direction of the missionary society into Hindostanee and Persian; and he had made some progress in an Arabic version when his failing health compelled him to suspend his labors. He was on his way home when he was overtaken by his last sickness. There is a memoir of his life by the Rev. John Sargent (1819).

MARTYR (Gr. *μαρτυρ*, a witness), a term applied to all who endure punishments for the sake of religion, and in a more limited sense to those who suffer death to bear testimony to the truth of the gospel. During the persecutions of the Christians in the early centuries an immense number of martyrs suffered for the faith, though Gibbon endeavors to prove that there were not more than 2,000 throughout the Roman empire. Their "acts," that is, the narratives of their trials, sufferings, and death, were piously collected by the faithful, and in Rome there were even deacons appointed especially for this purpose. A great number of these acts are still extant, many of which are of undoubted authenticity. The modes of punishment often displayed the most ingenious cruelty.

Some of the victims were beheaded, others burned to death, others scalded, others flayed alive, others thrown to wild beasts, others scourged, others crucified. It is said that Nero used to cause Christians to be smeared with some combustible substance and placed blazing in the public streets to light the road. The following instances of individual martyrdom are also recorded. St. Sebastian was shot with arrows, and left for dead, but recovering from his wounds was beaten to death with clubs. St. Lawrence was broiled on a huge gridiron. Flavia Domitilla and her two female companions were shut up in a room which was then set on fire. St. Symphorosa, after having been hanged by the hair in the temple of Hercules and severely scourged, was thrown into the river; and her 7 sons, who had to witness her sufferings, were then tied to stakes and martyred in each other's sight. During a terrible persecution at Lyons under Marcus Aurelius, Sts. Maturus and Sanctus were roasted in a red-hot iron chair. St. Blandina at the same period was scourged, torn by beasts, partly roasted on the iron chair, put into a net and tossed by a wild bull, and finally despatched with the sword. St. Felicitas, a noble Roman lady, after witnessing the torture and death of her 7 sons, was beheaded. The remains of vast multitudes of the martyrs were deposited in the catacombs of Rome, which thus came to be regarded as a great storehouse of relics from which the Roman Catholic churches have ever since been chiefly supplied. The festivals of the martyrs are celebrated on the anniversaries of their death.—For the conditions requisite, according to Catholic theologians, to entitle one to the name of martyr, see Cardinal Lambertini (afterward Pope Benedict XIV.), *De Servorum Dei Beatificatione et Beatorum Canonisatione*. MARVELL, ANDREW, an English author and legislator, born at Winestead, in Holderness, Yorkshire, March 2, 1621, died in London, Aug. 17, 1678. He was the son of the Rev. Andrew Marvell, master of the grammar school and lecturer of Trinity church in Hull, and at the age of 15 was sent to Trinity college, Cambridge. In the early part of his academical career he was induced by some Jesuit priests to leave his college and go to London, where he was discovered by his father, who caused him to resume his studies at Cambridge. He is said to have taken his degree of B.A. in 1638, and subsequent to 1641 he passed 4 years on the continent, remaining a considerable time in Italy, where he probably contracted his intimacy with Milton, which was interrupted only by the death of the latter. Subsequently he acted as private tutor to various persons, and in 1657 was asso-

ciated with Milton in the Latin secretaryship. In 1660, or according to some accounts in 1658, he was returned to parliament as one of the members from Hull, a position which he filled by successive elections until the close of his life. He is said to have been the last member of parliament who received "wages" from his constituents. Between 1661 and 1668, for some unknown cause, he was absent in Holland, and from July in the latter year to 1665 he acted as secretary to Lord Carlisle, the ambassador extraordinary to Russia, Sweden, and Denmark. With the exception of these intervals of absence, he was the watchful and incorruptible guardian of the interests of his constituents, with whom he maintained a close correspondence, sending them during the greater part of his legislative career a daily account of the proceedings in parliament. These letters, first published in 1777, are written in a laconic, business-like style, and afford a curious illustration of the ability and fidelity with which Marvell performed his public duties. He appears never to have spoken in parliament, but his strong views of the corrupt practices of the time, his biting satires in prose and verse on influential placemen, and the conviction among his opponents that he was not to be silenced by bribes or flattery, made him a formidable enemy to the court. It is even said that on more than one occasion he was threatened with assassination. He however retained the regard of some influential men of the opposite party, among others of Prince Rupert; and a familiar anecdote is told of his having so greatly pleased Charles II. at a private interview by his wit and agreeable conversation, that the latter despatched the lord treasurer Danby to offer him £1,000, with a promise of a lucrative place at court, which Marvell refused, notwithstanding he was immediately afterward compelled to borrow a guinea of a friend. The story rests wholly on tradition, but serves to illustrate the popular opinion of Marvell's probity and honor, which, "amid corruption perfectly unparalleled," were so conspicuous as to have earned for him the name of the "British Aristides." He died suddenly, supposed by some to have been poisoned, for which there seems to be no reasonable ground, and was buried in the church of St. Giles-in-the-fields at the expense of his constituents, who also voted a monument to his memory, which the rector refused to have erected. His chief work in prose is the "Rehearsal Transposed," written in reply to an acrimonious attack by Dr. Samuel Parker, afterward bishop of Oxford, upon the non-conformists, and in which he exhibited his adversary in so ridiculous a light that even his own party could not help laughing at him. A rejoinder, supposed to be by Parker, elicited the second part of the "Rehearsal," one of the most remarkable passages of which is the author's generous defence of Milton from the aspersions of his enemies. The whole work, though dealing in humorous satire with a broadness and coarseness unknown to controversial writings

of the present day, contains, amid all its levities, "a vehemence of solemn reproof, and an eloquence of invective," says Disraeli, "that awes one with the spirit of a modern Junius." His last work, "An Account of the Growth of Popery and Arbitrary Government in England" (1678), was so distasteful to the court, that a reward was offered for the discovery of the printer, and Marvell was compelled frequently to conceal himself from fear of assassination. His poems comprise a number of political satires, written in a coarser strain than his prose works, and which Hallam characterizes as "gross and stupid," and some minor pieces of great tenderness and beauty, including the well known commendatory lines on Milton's "Paradise Lost." A complete edition of his works was published in 1777 (8 vols. 4to.) by Capt. Thompson, a native of Hull; and an American edition of his poems, edited by James Russell Lowell, appeared in 1857 (12mo., Boston).

MARX, ADOLPH BERNHARD, a German composer and writer on music, born in Halle, Nov. 27, 1799. He was instructed in jurisprudence and held a judicial office at Nuremberg, but subsequently devoted himself exclusively to the study of music. In 1828 he became editor of the *Berliner Allgemeine Musik-Zeitung*, and the successful manner in which he conducted it for 7 years procured him in 1880 the appointment of professor of music in the university of Berlin, a position which he still holds. His labors have extended over every part of the science of composition and the history and philosophy of music. His principal works are: "The Theory of Musical Composition" (Leipzig, 1837; 8d ed. 1852; English translation by Saroni, New York, 1852), and "General Theory of Music" (Leipzig, 1839; 4th ed. 1850); and he has also written treatises on the "Art of Singing" (1826), "Painting in Music" (1828), &c., beside many articles in Schilling's "Universal Lexicon of Music." He is known as a composer by several musical dramas, symphonies, &c., and by his oratorio "St. John the Baptist."

MARY, the mother of Jesus. But little is recorded of the history of Mary in the Scriptures. Luke gives her genealogy, in order to prove the truth of the predictions which had foretold the descent of the Messiah from Adam through Abraham and David. The next mention of her is as a young maiden at Nazareth, where she was betrothed to a carpenter named Joseph. A heavenly messenger announced to her that through the overshadowing of the Holy Spirit she should conceive a son, who should be called the Son of God, and who would be the Messiah expected by the Jews. Almost immediately on receiving this announcement Mary hastened from Nazareth to visit her cousin Elizabeth, who was residing in the hilly district in "a city of Judah." When there, she uttered the *Magnificat*, a hymn which the Christian church has delighted from the earliest times to use as an expression of thanksgiving. After a sojourn of three months, she returned to Naz-

neri, *Il Diceto di Maria*, frequently republished in Italy; Ventura, Faber, Muzzarelli, &c.; St. Liguori, "The Glories of Mary," translated into English and frequently reprinted; "Life of the Blessed Virgin Mary," translated from the French of the abbé Orsini by Mrs. J. Sadlier (8vo., New York); "Life of the Blessed Virgin Mary," translated from the Italian of Gentilucci (8vo., New York); the Rev. T. Joslin, "Life of the Blessed Virgin" (New York, 1859); the Rev. T. S. Preston, "The Ark of the Covenant" (New York, 1860).

MARY I., first queen regnant of England and Ireland, fourth sovereign of the Tudor line, and daughter of Henry VIII. and of Catharine of Aragon, born at Greenwich palace, Feb. 18, 1515-'16, died at St. James's palace, Nov. 17, 1558. She was severely educated, according to a code of instructions drawn up by Ludovicus Vives. She was the object of various matrimonial negotiations in her infancy; it was proposed that she should marry the dauphin, son of Francis I. of France, and she was betrothed to the emperor Charles V. when in her 7th year. He desired that she should be sent to Spain for education, but her parents would not consent to part with her, though they gave her a Spanish education. Her father was at that time passionately attached to her, declaring her heir to the crown, and, according to one authority, creating her princess of Wales. She had a magnificent court at Ludlow castle, her chamberlain being that Dudley who in after days sought to prevent her from ascending the throne, and whom she sent to the scaffold. The countess of Salisbury, the last of the Plantagenet family, was at the head of her establishment. The emperor broke his contract with her on the ground that her father, by seeking a divorce from her mother, was seeking also his daughter's degradation. Henry then sought to marry her to Francis I., but that prince took for his 2d wife the emperor's sister Eleanor. Catharine wished her daughter to marry a son of Lady Salisbury, whose brother, Warwick, had been murdered by Henry VII. on the demand of Ferdinand of Aragon, before he would consent that his daughter should marry a prince of the house of Tudor. This son was the famous Reginald Pole, who was attached to Mary. Her hand was asked for the duke of Orleans, second son of Francis I., but vainly. After the birth of Elizabeth, Mary was degraded from the position she held; and when James V. of Scotland asked her in marriage, his suit was refused, from the fear that issue from such union would interfere with the title of Anne Boleyn's children to the crown. As she resisted as far as she could, it was reported that her father was indignant, and that her life was in danger. The treatment she received justified the fears that were entertained, and the emperor interfered in her behalf. After Anne Boleyn's death Mary was better treated; but her father's object, which was a renunciation of her right to the succe-

sion, was not obtained until some time after this change, when she signed articles acknowledging that her mother's marriage was incestuous and illegal, her own birth illegitimate, and the king's supremacy over the church absolute. She was then restored to some favor. Her hand was again asked for the duke of Orleans, and she stood sponsor to the young prince who was afterward Edward VI. Negotiations for her marriage with various princes were fruitlessly made, among them being the prince of Portugal, the duke of Cleves, and the duke of Bavaria. As she was regarded as the head of the Catholic party, she was an object of suspicion to her father and to the Protestants, and her situation was made painful by the legal slaughter of most of her friends, including the countess of Salisbury; but in 1544 she was restored to her place in the line of succession by act of parliament. She lived on the best terms with her last stepmother, Catharine Parr, and at her instance translated Erasmus's Latin paraphrase of St. John. During the reign of Edward VI. she took no part in politics, though she was denied the free enjoyment of her religion. Suitors for her hand continued to present themselves—the duke of Brunswick, the margrave of Brandenburg, and the infante of Portugal. The emperor threatened war if she were not exempted from the penalties prepared for non-conformists, and she was suspected of intending to take refuge at his court. On the death of Edward VI. Mary succeeded to the throne, after a brief but unimportant struggle with the partisans of the Dudleys and Greys, who had set up Lady Jane Grey as queen. She was merciful to the fallen, only 8 persons being executed for treason; and she refused to bring the lady Jane to trial, saying that she was merely a tool of Northumberland. A reaction in the government took place, for which the queen was less blamable than her councillors, the principal of whom was Bishop Gardiner, lord chancellor. Mary interfered to prevent the perpetration of cruelty by the privy council, and the early part of her reign was of a mild character. Her coronation took place Oct. 1, 1553. Her first parliament met 4 days later, and restored the laws relating to life and property to the state they were in at the 25th of Edward III., and annulled all the acts that cast a stain on the queen's legitimacy. The religious laws of Edward VI. were repealed, and the church of his father was restored, making Mary its head, much against her will; but while she held the post, the Protestants were not persecuted. Lady Jane Grey was attainted, but it was known that the queen intended to spare her life. Mary's resolution to marry Philip of Spain caused great alarm to her subjects. Formidable insurrections broke out, which were not quelled without much exertion, and in the course of the brief rebellion the queen showed both courage and capacity. The effect of this struggle was to give entire ascendancy to the reactionary party in the royal councils. The death

warrants of Lady Jane Grey and her husband, and of other persons, were signed; and the queen was urged to put to death her sister Elizabeth and the earl of Devonshire, who, however, were only sent to the tower. When her ministers would have punished the rebels with that sweeping slaughter which characterized most of the Tudor reigns, she interfered, and saved their lives. The marriage of Mary and Philip took place July 25, 1554. It proved fatal to Mary's peace, and most injurious to her character and reputation. England and Rome were reconciled, and those persecutions were commenced which have made of Mary's reign a by-word and a reproach; but according to many historians they were due to the influence of Gardiner and Bonner, the queen being ill most of the time. Ranke, however, gives credit to Gardiner's assertion, that the queen herself, and not he, insisted on the revival of the old laws against the Lollards; and though he admits that many of the horrors of their execution may have been kept from her, he adds that no apology will free her memory from the dark stain that clings to it: "for whatever is done in the name of a prince, with his will and by his authority, decides his reputation in history." Mary was neglected by her husband, to whom she was warmly attached. For his sake she involved her country in a war with France, against its interests, and English forces took part in the battles of St. Quentin and Gravelines. The French captured Calais, which the English had held for more than two centuries. War with France brought on war with Scotland. The loss of Calais was so mortifying to the English, that they insisted that Philip should make no peace with France without providing for its restoration; and it was with reference to the trouble which this caused her, that Mary said "she should die, and if her breast was opened, Calais would be found written on her heart." Her health had never been good, and she was indisposed during the greater part of her reign, of which circumstance her council took advantage. She suffered from dropsy and nervous debility, and her disappointment from not having children aggravated her illness. She recognized Elizabeth as her successor. In the summer of 1558 she was attacked by intermittent fever, by which thousands of her subjects had died, the consequence of the wet seasons that prevailed throughout her reign. When it was evident that her last hour was at hand, her court was deserted, most of its members hastening to Hatfield, the residence of Elizabeth. She was buried, on Dec. 14, in Henry VII.'s chapel.

MARY II., first queen regnant of Great Britain and Ireland, daughter of James II. and wife of William III., born at St. James's, April 30, 1662, died at Kensington palace, Dec. 28, 1694. Her father, at the time of her birth, was heir presumptive to the throne and duke of York, and her mother was Anne Hyde, daughter of the earl of Clarendon. She was educated at

Richmond palace, with her sister Anne, her preceptor being Henry Compton, bishop of London, who, though he could not have imparted to her much knowledge, was so fortunate as to acquire a strong influence over her mind, which had serious effects in later life. The persons employed under him were successful in their labors, as the princess was a very well educated woman for those times. She was married to her cousin, William, prince of Orange, Nov. 4, 1677, an alliance which was very popular throughout Great Britain. It was not, however, for some years, productive of happiness to the parties to it. Mary's father, as heir presumptive to the British crown, was an object of jealousy to all Protestants except the high churchmen, and even they saw with pleasure that his heir, the princess of Orange, was strongly attached to the church of England. William was jealous of his wife's position, as should she succeed to the throne, she would be his superior in rank and power; and should she die before him, and childless, the throne would pass to her sister Anne. William stood next in the order of succession to Anne, and all hope of Charles II. having legitimate offspring had long been abandoned. The prince was not an affectionate or a faithful husband, but the personal difficulties between him and his wife were removed before those of a political character were known to her, for she was ignorant of the superior position she was likely to hold with reference to her husband. Burnet, afterward bishop of Salisbury, effected a complete reconciliation between the prince and princess, the latter pledging herself to surrender all power to her husband, should circumstances ever place her on the British throne, a promise she would have found it difficult to keep had affairs taken the regular course. When William found himself compelled to take the leadership of that comprehensive opposition party which was formed in England against James II., in 1687-'8, he was strenuously supported by Mary against her father. Even had not the obligation to her husband been superior to that to her father, there was much in the conduct of the latter to excuse her course. He had never, since her marriage, treated her well, had used some of her friends harshly and illegally, and had conspired to take from her the crown of Ireland; and she shared in the common belief that the prince of Wales, born in 1688, was a supposititious child, who had been introduced into the royal family to prevent her from ever enjoying her inheritance. She acquiesced in the plan for the invasion of England in 1688; and when the earl of Danby sought to obtain the throne for her on the ground that there had been a demise of the crown, and that she was the next heir, she wrote him an earnest remonstrance, declaring that she was the prince's wife, that she had no other wish than to be his subject, that the most cruel injury that could be done to her would be to set her up as his competitor, and that she never could regard any per-

son who took such a course as her true friend. Could William have had his way, he would have reigned alone, and Mary would have been only queen consort; but the opposition to this plan was so great, that it was never pressed. The convention parliament declared William and Mary king and queen of England. Mary arrived in England on Feb. 12, and on the 13th she and her husband accepted the crown. The levity of her conduct on reaching Whitehall shocked persons of all parties; but it was adopted in order to please William, who had written to her to adopt an air of cheerfulness, as her friends had stated that she thought she was wronged, and the report would be confirmed if she wore a gloomy countenance; and she overacted the unnatural part she had assumed. She was called Goneril and Tullia by the Jacobites, and became the object of innumerable lampoons. The coronation took place April 11, 1689, when Mary was inaugurated like a king. During the absence of her husband, when in Ireland or on the continent, Mary was placed at the head of the government, and in that position showed tact and firmness under very trying circumstances. In 1692, after the naval victory of La Hogue, she declared that Greenwich palace, then in course of construction, should be converted into a retreat for those seamen who should be disabled in their country's service; and the vow thus made was kept. Toward the end of 1694 she was attacked by small pox, of which she soon died, to the great grief of her husband, to whom her decease was a political as well as personal loss, as her participation in his government gave to it a certain show of hereditary right. The attacks of the Jacobites on her unfilial conduct continued even after her death. She was buried with great pomp in Henry VII.'s chapel in Westminster abbey.

MARY OF MEDICI. See MARIA DE' MEDICI.

MARY MAGDALEN, probably so called from Magdala, a town of Galilee. She is commonly supposed to be the "woman, who was a sinner," of whom St. Luke (ch. vii. 37, 38) relates that as Jesus sat at meat in the house of Simon the Pharisee she washed his feet with tears and wiped them with the hairs of her head, and anointed them; but there is no evidence that this is the same person whom St. Luke mentions in the next chapter among the women who "ministered unto him of their substance" as "Mary called Magdalene, out of whom went seven devils." The supposition has also been entertained that she is identical with Mary the sister of Martha and Lazarus; but beyond the similarity of name, the affectionate devotion to Jesus Christ which distinguished both, the fact that the sister of Martha also anointed the feet of Jesus, and the opinion of some of the early fathers, among whom are Clement of Alexandria and St. Gregory the Great, no foundation for it has been assigned. Mary Magdalen stood by Jesus on the cross, and was present when Joseph of Arimathea laid him in the sepulchre. On the first day of the week she came early to the

tomb, and finding it open ran and told Peter and John that they had "taken away the Lord out of the sepulchre." Returning to the place with these apostles, she saw "two angels in white sitting, the one at the head, and the other at the feet, where the body of Jesus had lain." Immediately afterward Christ himself appeared to her, and announced his approaching ascension. Of her subsequent life nothing is known, but it is the theme of numerous legends. One of these, representing her as the sister of Martha and Lazarus, tells how she went with those two disciples into what is now Provence; and the story was deemed worthy of a long discussion by the authors of the *Acta Sanctorum*, in which finally nothing was decided. The tradition that she passed the latter part of her life in penitential exercises in the desert has been a favorite subject in the arts, and was treated by Guido, Correggio, Canova, and many other great masters.

MARY STUART, queen of Scots, born in the palace of Linlithgow in Dec. 1542, beheaded at Fotheringhay castle, Northamptonshire, England, Feb. 8, 1587. The precise date of her birth is unknown, for though it is commonly stated Dec. 8, documents recently discovered afford ground for the belief that the event must have occurred on the 11th or 12th of that month; and it was probably antedated on account of the 8th being one of the four great festivals of the Catholic church in honor of the Virgin, whose name was given to the child. She was the daughter of James V., 7th king of the Stuart line, and of Mary of Lorraine, daughter of Claude, duke of Guise, the founder of that family which had so conspicuous a part in the politics of France in the 16th century. Her birth took place at one of the dreariest periods of Scottish history, her father dying when she was but a few days old (Dec. 18), of mortification consequent on the defeats which the Scotch had voluntarily met with from the English at Fala and Solway Moss, the nobles being opposed to his policy. The earl of Arran, head of the house of Hamilton, and heir presumptive to the throne, was made regent by the parliament. Mary was crowned Sept. 9, 1548, at Stirling. Henry VIII. of England demanded her hand for his son, the prince of Wales, afterward Edward VI., he being anxious to accomplish the politic purpose of his father, which was to effect a union of the two crowns by marriage. At first he was successful, and a treaty was made, July 1, 1548, providing that Mary should be sent to England when she should have attained the age of 10 years, and that she should marry Edward as soon thereafter as possible. In 5 months this treaty was broken, the French and Catholic party triumphing over the English and Protestant party. An alliance was made with France, Dec. 15, and Henry declared war against Scotland, which his troops invaded. After his death, the protector Somerset continued his policy, and defeated the Scotch in the battle of Pinkie, Sept. 10, 1547.

Meantime the queen had lived at Stirling castle, with her governors, Lords Erskine and Livingston; but after the battle of Pinkie she was taken to the monastery of Inchmahome, on an island in Lake Menteith. Her mother and the regent Arran betrothed her to the dauphin of France, son of Henry II., and she sailed to that country from Dumbarton, Aug. 7, 1548, and arrived at Brest on the 18th. She was accompanied by four young ladies, Mary Livingston, Mary Fleming, Mary Beaton, and Mary Seaton, who were called "the four Marys." She was warmly received by Henry II., who treated her as a daughter. The French court was brilliant, learned, and licentious, love and letters commanding the attention of those who composed it. Mary profited in an eminent degree by the advantages it afforded for the acquisition of knowledge. Her Latin master was George Buchanan, one of the first scholars of the 16th century; and Ronsard taught her poetry. At 18 she pronounced a Latin oration which was much applauded. In 1551 her hand was formally demanded of Henry II. for Edward VI., but she herself refused to listen to the demand. The wide-spread dominion and power of the Spanish branch of the house of Austria having increased the fear of the house of Valois, Henry II. determined to complete his alliance with Scotland, and the dauphin Francis and Mary were married, April 24, 1558. The open conditions of the marriage were honorable to Scotland; but there were two secret acts, which were of grave moment. By the first, Mary gave Scotland to the sovereigns of France, in reward for the services Henry II. and his predecessors had rendered that country against the English; and by the second, she provided against the non-execution of the first. She also conveyed to Henry any claims that might accrue to her upon England and Ireland. Henry was to have the usufruct of Scotland until he should have repaid himself for what he had expended in her defence. These debts had never been accepted by Scotland. Mary had secretly protested in advance against the engagements she had entered into with her own subjects, and declared her wish to annex Scotland to France. The Scotch bestowed the crown matrimonial on Francis, and it was provided that all acts should be published in the name of Francis and Mary, king and queen of Scotland, dauphin and dauphiness of Vienne. When Mary I. of England died, Nov. 1558, Henry II. caused the dauphin to quarter the arms of England with those of Scotland, as he believed, or affected to believe, that Mary Stuart was legitimate heir to the English crown, as descended from Margaret Tudor, eldest daughter of Henry VII., Elizabeth, daughter of Henry VIII. by Anne Boleyn, having been declared a bastard. This act was the cause of most of the trouble that afterward befell the Scottish queen. Henry II. dying July 10, 1559, Mary became queen of France, a position she held not quite 17 months, her husband, Francis II., dying Dec. 5, 1560.

During his short reign, the Guises, who led the Catholic party, were masters of the kingdom, ruling the king through their influence over his wife, their kinswoman. Suitors for her hand 'soon appeared—the kings of Sweden and Denmark, and Philip II. of Spain, who wished her to wed his son and heir Don Carlos. She was coldly treated in France, where Catherine de' Medici, who was never her friend, had control of the government; and she resolved to return to Scotland. In that country, the French Catholic party had been overthrown, and the English Protestant party had triumphed, aided by Elizabeth's forces. By the treaty of Edinburgh, July 5 and 6, 1560, it was provided, among other things, that the French should leave Scotland, and that the Scotch sovereigns should cease to bear the arms and title of the sovereigns of England. Mary had eluded the ratification of this treaty. When she resolved to return to Scotland, she applied to Elizabeth for a safe-conduct through England, but it was refused, unless she would ratify the treaty of Edinburgh. Mary then embarked at Calais, Aug. 14, 1561, and arrived at Leith on the 19th, escaping the English cruisers. She left France with bitter regrets, and was herself much regretted there. Poets expressed the common feeling, and her own *chanson* bidding adieu to the country is universally known. On her arrival in Scotland, she found power in the hands of the Protestants, and submitted to what it was impossible to resist. Her chief ministers were her natural brother, the lord James Stuart, and Maitland of Lethington, who were among the ablest statesmen of the century. She expressed herself favorable to toleration, and asked it for herself, but obtained it with difficulty. Her position was one of great embarrassment. Sincerely Catholic, she was the sovereign of a people who had accepted the reformation, and who had displayed the utmost enmity to the old faith. The intolerance of the majority made the minority all the more devoted to their opinions. John Knox, the ablest of all the reformers after Luther and Calvin, used strong language to the queen, denouncing the mass, and insisting on the right of subjects to resist sovereigns. Her joyous modes of life were regarded with abhorrence by most of her subjects, and prepared them to believe the worst that could be alleged against her. Still her reign for some time was prosperous. Her brother, who was at that time attached to her, counselled her wisely, and acted vigorously. The rebellious Gordons were conquered. A good understanding with Elizabeth was effected, and preparations for a meeting of the two queens were partially made. Circumstances made it advisable that Mary should marry. Elizabeth wished her to marry the earl of Arran, but to this Mary would not consent. She desired to become the wife of Don Carlos of Spain, and refused the dukes of Nemours and Ferrara; but the Spanish marriage met with so much opposition, both at home and abroad, that she had to abandon all idea of it.

She was urged to accept the hand of the archduke Charles, 8d son of the emperor of Germany, Ferdinand I., but the proposition found no favor with her. Elizabeth then suggested Lord Robert Dudley, better known as the earl of Leicester, which Mary regarded as an insult; nor is it probable that Elizabeth was sincere in the proposition, and her object was, it may be supposed, to keep Mary in the same state of singleness to which she had doomed herself. Mary finally solved the difficulty by determining to marry the lord Henry Darnley, son of the earl of Lennox. Darnley was nearly related to both queens, as his mother, the countess of Lennox, was the lady Margaret Douglas, daughter of the earl of Angus and of Margaret Tudor, widow of James IV. of Scotland. He was handsome and accomplished, but he was of a fickle mind, and his talents were small. The Catholics favored the match, and the Protestants opposed it; and so powerful were the latter that, headed by the queen's brother, who had been created earl of Murray, and Lethington, they would have triumphed, and Mary would have married Leicester, could Elizabeth have been prevailed upon to recognize her as her heir. The Scotch statesmen, who were supported by some of the English statesmen, exerted themselves to have this recognition made; but Elizabeth desired that Mary should first accept Leicester. This caused Mary to persevere in her design, which, however, met with much opposition from Murray and others. Murray retired from the court, nor could Mary induce him to return to her service, or to consent to her marriage with Darnley. He resorted to deeds of violence in keeping with those of the Scotch aristocracy generally, and from that time must be dated his separation from his sister. Elizabeth continued her opposition to the marriage, and sent to propose to Mary to choose either Leicester, or the duke of Norfolk, or the earl of Arundel. But neither her opposition, nor the extreme measures of the church of Scotland, nor the lawless proceedings of Murray and others, could now avail to stop the marriage. Darnley had been created lord of Ardmanach and earl of Ross, and on July 20, 1565, he was made duke of Albany; and 9 days later the marriage took place. On the previous day Mary had conferred on him the title of king. The alliance must have been popular in Scotland, or Mary could not have triumphed in opposition to so many powerful influences; but it caused dismay in England. Murray headed a rebellion, relying on English assistance; but Mary's energetic proceedings led to his prompt defeat, and the assertion of the royal authority. Unfortunately, her success led Mary to entertain the idea of overthrowing Protestantism, whereas she had succeeded only because her subjects had believed her to be upholding the existing system against the designs of a few ambitious and selfish nobles. She put herself in communication with the courts of France and Spain, and with the pope. From Spain and Rome she received some money, but Philip II. could afford

her no military assistance, though he intimated that he might furnish it at a future period. Mary now assumed a high tone toward Elizabeth; and as she was supported by the French and Spanish ambassadors, the English queen had to abate her pretensions. She even denounced Murray to his face for his rebellion, though she had aided and abetted him in it. Murray was desirous of pardon, and appears to have been sincerely anxious to return to his allegiance. But Mary was resolved on his destruction, and on that of most of his associates. She was now much under the influence of David Rizzio, one of those clever Italian adventurers who then swarmed over Europe, and who filled every kind of employment in all countries, from that of the statesman to that of the spy. The queen's love for Darnley was of brief endurance, his worthlessness having soon become apparent. They quarrelled, and Darnley affected to believe he had been dishonored by Rizzio. Darnley wished for the crown matrimonial, meaning an equal share in the royal authority, which Mary had promised him in the days of their attachment. This promise she now refused to keep, and Darnley attributed her decision to Rizzio. He conspired to effect his destruction, the chief conspirators under him being Lord Ruthven, head of an ancient family, the earl of Morton, chancellor of Scotland, the earl of Lennox, Darnley's father, Lethington, Lord Lindsay, and John Knox. The plans of the conspirators were very comprehensive, the murder of Rizzio being but an item in them, for the gratification of Darnley, and because the Italian was known to be a strong enemy of the reformation, then struggling for existence, Mary herself having formally given her adhesion to the party of reaction by joining the league of the Catholic sovereigns of the continent to exterminate Protestantism. The English party was to be restored to power; Murray was to be recalled and placed at the head of the government; Darnley was to be made nominal king; Mary was to be imprisoned, the exiles were to be restored, and Rizzio was to be murdered. These details show that Darnley was not the real framer of the conspiracy, and they were the work of Morton, a man as skilful as he was unscrupulous, and who was not only strongly attached to the reformation, but feared to lose the church lands it had been the means of his acquiring, and also his office. The conspiracy was known to Elizabeth and her ministers. On the evening of March 9, 1566, several of the conspirators entered the room where Mary was supping, with Rizzio and others, in Holyrood palace, and dragged the Italian to the entrance of the presence chamber, on the stairs of which he was slain, receiving 56 wounds. Darnley was one of the most active of those who entered the queen's cabinet, and it was by him that Rizzio was torn from the hold he had on the queen's garments, and he held her while his associates despatched the Italian. Mary was for a time the prisoner of the conspirators,

but by deceiving Darnley she effected her escape. Murray returned, and while she was reconciled to him and his immediate friends, she pursued the murderers of Rizzio with implacable resentment. Seventy of them, headed by Morton, fled to England; Lennox was banished from the court, and Lethington deprived of his office. She no longer disguised her hatred of Darnley. On June 19 she gave birth to her only child, afterward James VI. of Scotland, and James I. of England. At this time her connection with the earl of Bothwell commenced. He was a powerful nobleman, bold, unscrupulous, and accomplished, and it was natural that Mary should wish to secure his services; but her enemies charge that she entertained a criminal passion for him. Be that as it may, she showed him high favor, while she treated her husband more contemptuously than ever. A plan for the destruction of Darnley was formed by Lethington, who wished to gratify the queen by ridding her of her husband, either by divorce or by murder, and to effect the restoration of Morton and his associates. Bothwell joined the conspiracy, as did other great nobles. Murray did not oppose it. It is charged that it was communicated to the queen, and that she offered no serious opposition to it. A bond to cut off the king, and to protect each other, was drawn up and signed by the conspirators. Morton, on his return, was ready to join them if he could have the queen's written warrant, which Bothwell sought to obtain, but unsuccessfully. Darnley was now ill of the small pox at Glasgow. There he was visited by Mary, and a reconciliation was apparently effected. On his recovering sufficiently to travel he was removed to the provost's house at Kirk of Field, near Edinburgh, where Mary attended him with much apparent kindness, passing several nights under his roof. This house was blown up on the night of Feb. 9, 1567, while the queen was attending a masquerade at Holyrood palace. Of Bothwell's guilt of this murder there is no doubt whatever, but Mary's part in it is not so clear; and the main point in that "Marian controversy" which has continued to the present time turns upon the question of her participation in Bothwell's conspiracy. The impression at Edinburgh was unfavorable to her, and did not lack expression; and her indifference, and her refraining from any exertion to punish those who were loudly accused by the general voice, deepened the belief in her guilt. Instead of complying with Lennox's demand for the arrest of Bothwell, she heaped favors upon the murderer. Public opinion, as pronounced both at home and abroad, compelled her to order that Bothwell should be tried; but his trial was a mockery, the government acting scandalously in his behalf, and he was acquitted. New and signal marks of favor were bestowed upon him, and the whole power of the government was in his hands. He sought to marry the queen, and was divorced from his wife, his object being the crown. At a tavern supper, to

which he invited many of the nobles and others, he procured, partly by intimidation and partly by falsehood, their signatures to a bond declaring him innocent, and recommending the queen to marry him. On April 24, while returning from Stirling to Edinburgh, she was seized by Bothwell, and conducted to his castle of Dunbar. She was allowed to return to Edinburgh on May 3, when Bothwell's divorce was completed. Her intention to marry him was then announced. He was made duke of Orkney, and on May 15 they were married. This marriage created universal disgust. A conspiracy which had been formed against Bothwell, composed of the chief nobles, now assumed a serious magnitude, and hostilities broke out early in June. The confederates seized Edinburgh, and when the two armies met on Carberry hill, June 15, Mary was deserted by most of her troops, and was compelled to surrender. Bothwell fled, and never returned. The queen was committed to Lochleven castle, where, on July 25, she signed an act of abdication in favor of her son, and other acts arranging the government, of which Murray was to be the head, as regent. These acts were extorted from her, and depended for their validity entirely upon the power of the confederates to maintain their position. Elizabeth denounced them and their conduct, but this did not prevent them from making the infant prince king. On Murray's return from France, he visited Mary, and by working on her fears he had the art to make her request him to accept the regency. Parliament passed an act virtually dethroning the queen, and charging her with being privy to Darnley's murder. On May 9, 1568, she made her escape from Lochleven, and succeeded in rallying a powerful force to her support, which was defeated at Langside, May 13, by Murray. Mary fled to England, which she entered May 16. There was no occasion for this course, which was the most unwise she could have adopted; and she might have gone to France, or have remained in Scotland. At first she was treated with some consideration by Elizabeth, but the latter assumed the part of judge between Mary and her opponents, and affected to decide on her guilt or innocence of the charges preferred against her. The examinations were unfairly conducted, and injured Mary's reputation. During the early years of her residence in England she was variously treated, and it was not until 1573, when her party in Scotland was finally overthrown, that she lost all hope of deliverance from that quarter. She was concerned in various attempts that were made against Elizabeth's government, and sought to marry the duke of Norfolk. She intrigued with the king of Spain, and with other foreigners of eminence, for the purpose of effecting her liberation; but for this she cannot be censured, as she was unjustly detained in England, and all the difficulties her presence caused there were owing to the conduct of Elizabeth and her ministers. The northern rebellion, headed by Northumberland

and Westmoreland, which was the last open effort made by the Catholics to restore the old faith, she discouraged. At one time, in 1571, Elizabeth was on the point of restoring her; but in 1572 she engaged in a treaty with the Scotch government for the surrender of Mary, who was to have been tried, condemned, and put to death. This plan failed through the death of the regent Mar, as it had previously failed through the deaths of the regents Murray and Lennox. Beside the duke of Norfolk, her hand was sought by Leicester, and Sir George Carey, a near relative of Elizabeth. Don John of Austria was also one of her suitors. She was confined in various places, her chief gaoler being the earl of Shrewsbury. In most cases her treatment was outrageous, and shows the extent of Elizabeth's personal hatred of the woman she had wronged, and that she desired to effect her destruction. Mary was the object of both the fear and the hatred of the reformers, and her death was demanded by them, through the ministers of Elizabeth and through parliament. She was believed to be the principal person in all the numerous conspiracies that were formed against Elizabeth, though with most of them she could have had no connection. An "association" was formed, directed not only against those who should do violence to Elizabeth, but also against those for whose benefit the crime should be committed. Parliament sanctioned this "association" in 1585. Babington's conspiracy was formed in 1586, one of the objects of which was to liberate Mary, who had some correspondence with Babington, in which no encouragement, however, was given to his designs against Elizabeth. This conspiracy early became known to Elizabeth's ministers, who nursed it, until even the queen became alarmed, and compelled the arrest of the assassins. It was then resolved to proceed against Mary, who had been removed to Fotheringay castle, Sept. 25, 1586. A commission, composed of 46 persons, was appointed to try her. At its head was the chancellor, Bromley, and the treasurer, Burleigh, was one of its members. The other members were all persons of eminence, either state officers, or peers, or lawyers. This commission, of which 11 members refused to act, met at Fotheringay castle on Oct. 11, 1586, and after overcoming Mary's original determination not to acknowledge its jurisdiction, proceeded with the trial on the 14th. She defended herself with skill and success against the great array of talent on the other side, and the commissioners durst not come to a decision in her presence. They adjourned to Westminster, after sitting two days, and on Oct. 25 they unanimously declared her guilty. It was not until Nov. 19 that Mary was informed of their decision, and she heard it with calmness. Efforts to save her life were made by the governments of France and Scotland, but fruitlessly. The publication of the sentence of death, Dec. 4, in London, was received with extravagant demonstrations of joy. Parliament urged execution.

Elizabeth, however, was reluctant to proceed to extremities, and for 6 weeks the warrant for her execution remained unsigned in the hands of Davison; nor is it certain that she ever signed it. A warrant purporting to bear her signature was given by Burleigh and his associates to Beale, Feb. 8, 1587, but there is evidence that it may have borne that signature in consequence of a forgery effected by one Harrison, a clerk in the service of Secretary Walsingham, the most implacable and dishonest of Mary's enemies. An attempt to induce her gaolers to poison her, in which Walsingham and Davison were the principal instruments, had failed. On Feb. 7 the earls of Kent and Shrewsbury proceeded to Fotheringay castle, and informed Mary that she must prepare to die the next morning, at 8 o'clock. She was taken by surprise, but bore herself with characteristic firmness. She made all her preparations for death with deliberation, and at the appointed time proceeded to the scaffold, which had been erected in the banqueting hall. She was denied the presence of her almoner, and was rudely importuned to change her faith by the bigoted dean of Peterborough, and by the brutal earl of Kent, whose efforts she quietly but firmly repulsed. She died with heroic bravery; and even when the executioner at first struck her on the skull, inflicting a horrible wound, she did not shrink or groan. Two more blows were necessary to despatch her. After being contemptuously neglected for 6 months, her remains were buried in Peterborough cathedral, Elizabeth acting as chief mourner through Lady Bedford; and 25 years afterward they were removed to Henry VII.'s chapel, in Westminster abbey, by order of her son James I. When Elizabeth was informed of Mary's death, she expressed great indignation, forbade Burleigh and Walsingham her presence as the sole authors of the crime, and sent their principal tool, Secretary Davison, to the tower, and had him fined £10,000, equal to £70,000 at the present value of money. Davison's word is all the evidence that exists of Elizabeth having signed the warrant, and he was not only a witness in his own cause, but had been concerned in an attempt to induce Mary's gaolers secretly to poison her.—The question of Mary's guilt or innocence of the crimes charged against her has been vehemently debated for almost three centuries, and hundreds of works have been written on it, while she has been a favorite character with poets and novelists. The question seems no nearer to a solution now than it was in the early days of her residence in England, when it was debated by George Buchanan on the one side, and by Lesley, bishop of Ross, her champion, on the other. Among the numerous works in relation to Mary, we cite those of Lesley, "Defence of the Honor of Marie, Quene of Scotland and Dowager of France" (London, 1569); George Buchanan, *De Maria Scotorum Regina*, &c. MARYLAND, one of the original states of the American Union, situated between lat. 37° 48' and 39° 44' N., and long. 75° 04' and 79° 33' W., having an extreme length E. and W. of 196 m., and a breadth varying from about 10 m. to 120 m.; area (not including Chesapeake bay), 11,124 sq. m., or 7,119,860 acres, being 0.38 per cent. of the total land area of the United States. It is bounded N. by Pennsylvania, from which it is divided by a parallel known as "Mason and Dixon's line;" E. by Delaware and the Atlantic ocean, on which it has a shore line of 88 m.; S. and S. W. by Virginia, from which it is divided in the Accomac peninsula by a line E. from the mouth of the Pocomoke to the Atlantic, and on the mainland by the Potomac to the head of its N. branch; and W. by Virginia, the dividing line being the meridian of the head of that branch of the river. The state is divided into 21 counties, viz.: on the "eastern shore," Caroline, Cecil, Dorchester, Kent, Queen Anne, Somerset, Talbot, and Worcester; on the "western shore," Anne Arundel, Baltimore, Calvert, Charles, Harford, Howard, Montgomery, Prince George, and St. Mary's; and in

the "north-west," Alleghany, Carroll, Frederic, and Washington. The chief cities and towns are Annapolis, the seat of government, Baltimore, the chief commercial and manufacturing city, Ellicott's Mills, Port Tobacco, Havre de Grace, Port Deposit, Elkton, Chesapeake City, Chestertown, Easton, Cambridge, Frederic City, Boonsborough, Westminster, Hagerstown; and in western Maryland, Cumberland, the central depot of the Alleghany mining districts.—The population of Maryland, according to the federal census returns, has been as follows:

Census years.	White persons.	Free colored.	Slaves.	Total population.

Of those over 80 years old, 1,451 were white, 628 free colored, and 556 slaves; over 100, 17 white, 59 free colored, and 55 slaves. Of the total free population (492,666), 438,916 were born in the United States, 53,288 in foreign countries, and 462 in unascertained parts; and of those born in the United States, 400,594 were natives of Maryland, 16,076 of Pennsylvania, 7,080 of Virginia, 4,373 of Delaware, 2,646 of New York, 1,940 of the district of Columbia, 1,421 of Massachusetts, and 1,321 of New Jersey. Of the foreign population there were from Germany, 27,140; England, 3,467, Scotland 1,093, Wales 260, and Ireland 19,557—total from the United Kingdom, 24,377; France, 500; West Indies, 279; British America, 215; Holland, 106. Of 124,876 free male persons over 15 years of age returned by the census of 1850 as engaged in industrial pursuits, 47,616 were employed in commerce, trade, manufactures, mechanic arts, and mining; 28,588 in agriculture; 32,102 in

labor not agricultural; 67 in the army; 9,740 in sea and river navigation; 2,059 in law, medicine, and divinity; 2,442 in other pursuits requiring education; 963 in government civil service; 1,021 in domestic service; and 278 in pursuits the nature of which is not specified. The number of persons employed in manufacturing establishments, &c., in 1820, was 18,640; in 1840, 21,325; and in 1850, 30,124. The number of slaveholders in the state in 1850 was 16,040; viz.: holders of 1 slave, 4,825; of 1 and under 5, 5,831; of 5 and under 10, 3,327; of 10 and under 20, 1,822; of 20 and under 50, 655; of 50 and under 100, 72; of 100 and under 200, 7; and one of between 300 and 500 slaves. The number of persons (white and free colored) born in the census year and living June 1, 1850, was 14,036, or 2.87 per cent. of the classes referred to; married in the same year, 3,703 couples, or 0.75 per cent.; died, 8,109, or 1.65 per cent. The total deaths, including slaves, amounted to 9,621, or 1.65 per cent. The federal representative population (all the free and $\frac{3}{4}$ of the slave) was 546,887, and entitled the state to 6 members of congress.—The sea coast, as before observed, has a length of only 83 m.; but including the whole tide water region of Chesapeake bay, the shore line is estimated at 411 m., and if the shores of islands be included, at 509 m. The principal rivers belonging wholly or in part to Maryland are the Potomac, Patuxent, Severn, Patapsco, Susquehanna, Elk, Choptank, Nanticoke, and Pocomoke. The rivers of the eastern shore, with the exception of the Choptank and Nanticoke, are rather inlets into which flow numerous small creeks than rivers, and are navigable only near their mouths. On the western shore, however, are the Potomac, navigable about 800 m.; the Patuxent, 50 m.; the Patapsco, 22 m.; and the Susquehanna, navigable beyond the Maryland boundary. Chesapeake bay, which almost bisects the state, extending northward within 14 m. of the frontier of Pennsylvania, receives nearly all the rivers of Maryland. At its mouth, between Cape Charles and Cape Henry, it is 15 m. wide, its opening facing E.; but on penetrating the land it almost immediately changes its direction, its length lying almost due N. and S. A little below the mouth of the Potomac it is about 30 m. wide, after which it again contracts, and at its head branches off into several small estuaries, just above the mouth of the Susquehanna. It is nearly 200 m. long, and navigable throughout. It contains many small islands, and its shores are indented with innumerable bays and inlets. The Atlantic coast of Maryland has no harbors, and is bordered throughout by a sandy beach from a few yards to more than $\frac{1}{2}$ m. in breadth, enclosing a shallow lagoon, which now, however, owing to the blocking up of several passages by which it formerly communicated with the sea, may almost be termed a fresh water bay or *lac*.—The surface of the eastern shore of Maryland, which forms part of the peninsula

lying between Chesapeake and Delaware bays, is low and level except in the N. part, where it is somewhat broken and rocky. The soil of this region is generally sandy. That part of the western division of the state which forms the peninsula between Chesapeake bay and the estuary of the Potomac presents the same natural features. The north-west is rugged and mountainous. The Blue Ridge, and other main ranges of the Alleghanies, cross it from Virginia into Pennsylvania. None of these chains attains a great elevation. In the variety of its geological formations and mineral productions, Maryland is one of the most remarkable states in the Union. Along the seaboard and the shores of the Chesapeake bay occur alluvial deposits of the present epoch. Next older are the beds of the pleistocene recognized in St. Mary's co., whence the formation extends southward along the coast of Virginia and North Carolina. The eastern shore is overspread almost exclusively with the clays, sands, and calcareous marls of the miocene; and the same formation is found on the W. side of the bay, reaching back to the E. edge of the metamorphic rocks, the line of which is commonly marked by the lowest falls of the rivers, as they descend from this platform of ancient rocks. The miocene formation is exposed in the banks of the creeks and rivers, and its beds of shell marl are there largely excavated for the valuable fertilizing materials they afford. Deposits of bog ore are found in this formation, as well as in more recent ones; and at a locality of the latter at Snowhill, in Worcester co., on the eastern shore, this ore has been profitably smelted for many years. (See BOG ORE.) Among the tertiary ferruginous sands and clays spread over the western shore, from the vicinity of Washington to the head of the bay, are numerous deposits of argillaceous carbonate of iron in flat bands and balls, which are largely worked for the supply of many blast furnaces. (See IRON.) The cretaceous formation enters the N. E. corner of the state from New Jersey and Delaware; but it is lost S. of the Susquehanna river. Immediately back of Baltimore are hills of metamorphic rocks, talcose and mica slates, and limestones, which extend N. E. and S. W. across the state. Among them are serpentine rocks, which constitute barren hills known as the "Bare Hills." In these, beds of chrome iron have been extensively worked, and their products have been converted into chrome pigments, and also exported to Europe. The same formations have yielded large quantities of the silicates and hydrates of magnesia. Mines of copper ore have also been worked in the metamorphic rocks, and others of hematite support numerous blast furnaces; in the same group of rocks are also extensive quarries of limestone and marble. At Sykesville on the Patapsco specular iron ore is found, and worked in connection with pyritous copper ores. Passing westward across the metamorphic belt, one meets included in it the narrow strip of the "middle secondary red sandstone," which

is traced from New Jersey through Pennsylvania and Maryland into Virginia. It passes through Carroll and the eastern part of Frederick co., crossing the Potomac just W. of Montgomery co. In this region was obtained from this formation the brecciated marble of which the pillars in the old hall of representatives in the capitol at Washington were made. In Frederick co., along the range of this belt, have been worked a number of copper mines. The portion of the metamorphic group lying W. of this trough of the middle secondary is but a few miles wide; and in the Oatocin and South mountains on the W. line of Frederick co. are found the silurian rocks, the Potsdam sandstones, and the Trenton and associated limestones, the lower members of the Appalachian system of rocks. The calcareous strata over-spread the E. portion of Washington co., extending N. in a broad belt into Pennsylvania and S. into Virginia. The finest valleys of the middle states lie on their range, and wherever met with these rocks give fertility to the soil and beauty to the scenery. Newer members of the Appalachian series of rocks succeed toward the W. to these lower formations, and are repeated with them in successive parallel ridges, which are the eastern members of the Appalachian chain. At Cumberland in Alleghany co. commences the ascent of the main ridges. Up their slope the middle silurian rocks soon give place to the red shales and sandstones of the devonian, and these are succeeded by the carboniferous formation, which caps the summits of Dan's and Savage mountains, and over-spreads the intervening valley of George's creek, as the strata dip in each direction into the trough-shaped basin. At Frostburg, Lonaconing, Westernport, and other points in the valley, is obtained the semi-bituminous coal known in the eastern markets as Cumberland coal, Cumberland being the point to which it was formerly brought by railroad or otherwise, to be shipped by the canal. This being now extended to Westernport, the coals of the basin are shipped direct by it, or taken by the Baltimore and Ohio railroad, which passes by Westernport, while the products of the mines near Frostburg are carried by railroad to Cumberland. Extensive iron works have been in operation at Mt. Savage, and also at Lonaconing, converting the iron ores of the coal formation into pig iron, and this into rails and other forms of wrought iron. The supply of ores, however, has proved uncertain, and, like most other attempts to found large operations upon these ores, the enterprises have not prospered. From this point to the W. boundary of the state the country continues mountainous, consisting of parallel ridges and valleys, the former capped by the coal formation or the underlying conglomerate and red and gray sandstones, and the valleys occupied by the coal measures.—The soil of the eastern shore is not naturally rich, but by the aid of manure it may be made to yield abundant crops. The beds of marl which are found in the

state furnish an excellent fertilizer. On the other side of the bay a tract closely resembling this lies along the shore. It has been much improved of late years by the use of marl, bone dust, and guano, and forms the chief tobacco-growing region of the state. Some of the valleys of the interior and northern counties are extremely fertile. The climate is temperate, and in most places salubrious, although the lowlands bordering on the bay are subject to miasmata which produce bilious fevers and fevers and agues. The commonest forest trees are the oak, hickory, chestnut, pine, locust, walnut, cedar, gum, and beech. Cotton, raised in the S. part of the eastern shore, tobacco, and especially wheat and Indian corn, are the staple cultivated crops. Maryland is the third tobacco-growing state in the Union as far as absolute quantity is concerned, while in proportion to its population it is the second. Oats, rye, buckwheat, barley, peas, beans, Irish and sweet potatoes, hops, flax, hemp, hay, dairy produce, wine, beeswax, honey, maple sugar, molasses, wool, and silk are also produced. In 1850 there were in the state 21,860 farms and plantations, covering 4,634,356 acres, of which 2,797,905 acres were improved and 1,836,445 unimproved lands, valued at \$87,178,545; and the value of implements and machinery thereon was \$2,468,443. The crops of 1849-'50 consisted of wheat 4,494,680, rye 226,014, oats 2,242,151, Indian corn 10,749,858, barley 745, buckwheat 103,671, Irish potatoes 764,989, sweet potatoes 208,998, and peas and beans 12,816 bushels; hay 157,956 tons; hops 1,870 lbs.; clover seed 15,217, and other grass seed 2,561 bushels; beeswax and honey 74,802 lbs.; flax seed 2,446 bushels; flax 85,686 lbs.; dew-rotted hemp 63 tons; maple sugar 47,740 lbs.; molasses 1,480 galls.; tobacco 21,407,497 lbs.; silk cocoons 89 lbs.; and wine 1,431 galls. The value of market garden products was \$200,869, and of orchard products \$164,051. The live stock owned in the state, June 1, 1850, consisted of 75,684 horses, 5,644 asses and mules, 86,856 milch cows, 84,135 working oxen, 98,595 other cattle, 177,902 sheep, and 352,911 swine; total value, \$7,997,684; value of animals slaughtered in the year preceding, \$1,954,800. The products of animals were: butter 3,806,160 lbs., cheese 8,975, and wool 477,438. The value of home-made manufactures was \$111,828. The total value of agricultural products was \$16,296,199. The average yield of the several staples to the acre in Maryland in 1849-'50 was: wheat 18 bushels, rye 18, Indian corn 23, oats 21, tobacco 650 lbs., Irish potatoes 75 bushels, and hay 1 ton; and the proportion of certain crops to the total of like crops in the United States was as follows: wheat 4.47 per cent., Indian corn 1.52, tobacco 10.72, wool 0.91, and hemp 0.18. The number of tobacco plantations on which 3,000 lbs. or upward of the leaf was grown was 1,726.—In 1810, the manufactures of Maryland were valued at \$8,879,861; in 1840 at \$13,509,686. In 1850, the number of manufacturing establishments was 5,708; total capital, \$14,753,143; hands,

32,194, viz.: 32,641 males and 7,453 females; value of raw material consumed, \$17,326,784; cost of labor (wages), \$7,874,672; value of manufactured products, \$32,477,702. The statistics of the principal manufactures are shown in the following table:

In foreign commerce Maryland occupies the sixth place in the Union, and is on an equality with Pennsylvania. The states having a larger amount of imports and exports are New York, Louisiana, Massachusetts, California, and Alabama. The value of exports for the year ending June 30, 1850, was \$6,967,858, of which \$6,589,481 was of domestic produce; that of imports was \$6,124,901. For the year ending June 30, 1850, the exports amounted to \$9,236,399, of which \$9,074,511 was domestic produce, and the imports to \$9,718,921. The shipping employed in this trade was as follows: entered in 1849-'50, 99,388 tons, viz.: American 70,427, and foreign 29,161; cleared, 126,819 tons, viz.: American 89,296, and foreign 37,523; entered in 1858-'9, 109,993 tons, viz.: American 134,820, and foreign 55,172; cleared, 171,446 tons, viz.: American 115,891, and foreign 55,555. The total shipping owned in the state in 1850 amounted to 193,087 tons, of which 90,869 was registered and 12,457 steam; and in 1859 to 251,001, of which 115,228 was registered and 135,778 enrolled and licensed. The shipping built in the state amounted in 1850 to 15,964 tons, and in 1859 to 7,186. The following table exhibits the progress of the commerce, navigation, &c., of the state for the 10 years ending June 30, 1859:

The domestic trade, internal and coastwise, is extensive, and constantly increasing. Baltimore is now connected by railroad with Wheeling (379 m.) and Parkersburg (388 m.), both on the Ohio; with Philadelphia (98 m.), New York (135 m.), Harrisburg (84 m.), Williamsport (178 m.), and the ports of the lakes; and with Washington (39 m.), and all the principal places of the South and South-West.—The following is a list of the railroads of this state, with their cost to 1859:

Railroads.	Length, miles.	Cost.
Annapolis and Elbridge.....	20.5	\$402,000
Baltimore and Ohio.....	379.6	24,300,000
Branches.....	7.3

Coal railroads.....	100.0	2,000,000

A large portion of these roads traverses the neighboring states; the actual length in Maryland is not more than 500 m., or about a mile of railroad to every 25 sq. m. of territory. The coal roads consist of the Cumberland (Eckhart), the Cumberland and Pennsylvania, George's Creek, and a number of others in the same neighborhood. The Chesapeake and Ohio canal follows the valley of the Potomac from Cumberland, the centre of the mining region, to Georgetown, D. C., and Alexandria, Va., and has a length of 198 m. A part of the Susquehanna and tidewater canal is within this state, and also a part of the Chesapeake and Delaware ship canal. The coasting trade employs a vast amount of tonnage, and regular steam communication is maintained with all the great Atlantic cities. Baltimore, the chief port of the state, is indeed one of the great depots of the domestic and foreign commerce of the Union. The total length of post route in the state in 1858 was 2,835 m., of which 748 m. was railroad, 429 m. coach road, and 1,658 m. other road. The number of banks in the state in Jan. 1851, was 25, and in Jan. 1860, 32. The liabilities of these institutions at the latter date was as follows: capital, \$12,560,635; circulation, \$3,218,749; deposits, \$9,486,273; profits on hand, \$930,796. Resources: notes, bills of exchange, &c., \$22,416,957; specie, \$3,394,671; real estate, \$484,825; total, \$26,196,453.—The government of Maryland is based on the constitution of July 4, 1851. Every free white male citizen of the United States, 21 years of age, who has resided in the state 1 year and in the district 6 months, is qualified to vote for all elective officers. The general election is held on the first Wednesday of November biennially. The legislature is composed of a senate of 22 members, chosen for 4 years, one half every 2d year, and a house of delegates of 74 members, renewed biennially. Members of both houses must have resided in the state 3 years, and in the district for which elected for the last year thereof; and senators must be 34, and delegates 21 years of age. The legislature meets on the first Wednesday in January every 2d year. The president of the senate and speaker of the house have each \$5 a day during the sessions. The governor of the state is chosen by a plurality of votes, and his term, commencing on the 2d Wednesday of January (even years), continues for 4 years; salary, \$3,600 per annum. He must be 30 years of age, a citizen of the United States, and have resided in the state 5, and in the district from which elected 3 years. The state is divided into 3 gubernatorial districts—

east, middle, and north; and the governor is elected from each in rotation. There is no lieutenant-governor, but in case of the governor's death or disability, the president of the senate, or failing him, the speaker of the house, succeeds to the executive, and holds office until a governor is elected by the people. The chief executive officers are appointed by the governor; these are the secretary of state, salary \$1,000; the treasurer, \$2,500; the controller, \$2,500, &c. The judiciary consists of a court of appeals with 4 judges (one of whom the governor names as chief justice), elected by the people for 10 years, or until 70 years of age; and of 8 circuit courts, each presided over by a judge who is elected for 10 years, except in the city of Baltimore, where the circuit is divided into a criminal court, a court of common pleas, and a superior court, each having one judge elected for 10 years. Beside these, there are several local courts. Each county and the city of Baltimore elect 8 persons as judges of the orphan court, to hold office for 4 years; a register of wills for 6 years; justices of the peace, 2 sheriffs, and constables, for 2 years. Attorneys of the commonwealth are chosen in each county by the people for 4 years. The revenue of the state is derived chiefly from taxation, licenses, tobacco inspections, lotteries, interest and dividends from investments, &c. The greatest portion of the income is paid out on account of the state debt and liabilities. The receipts into the treasury for the fiscal year ending Sept. 30, 1859 (exclusive of balance from previous year) were \$1,200,552.77, and the disbursements were \$1,129,869.69, including amounts paid for redemption of the state debt. The balance in the treasury, Sept. 30, 1859, was \$518,291.16. The nominal public debt at the close of the fiscal year 1859 amounted to \$14,821,478; at the close of 1855 it was \$15,132,909. The sinking fund amounted in 1859 to \$4,582,975, which consists entirely of state bonds; and the state has also property in railroads, banks, and other dividend-paying institutions, amounting to \$9,500,000. The unproductive property of the state amounts nominally to about \$14,000,000, the greater part of which will never be realized. In 1858 the assessed valuation of taxable property was \$255,447,588; on this the state direct tax is 10 cents on the \$100. The school fund amounted in 1859 to \$327,268. The principal institutions supported in part or wholly by the state are the Maryland asylum for the insane, and the state penitentiary, both at Baltimore.—The number of children returned by the census of 1850 as attending school was 62,063, or one to every 7.94 of the free population; and the state contained in that year 898 primary and public schools, with 986 teachers, 83,111 scholars, and \$218,886 annual income; 228 academies and private schools, with 503 teachers, 10,787 scholars, and \$232,841 income; and 13 universities and colleges, with 98 teachers, 1,127 students, and \$113,714 income; total, 1,184 schools, 1,587 teachers, and 45,025 schol-

ars, supported by an aggregate income of \$564,891. The number of free persons over 20 years of age who could not read and write was 41,877, of whom 20,815 were white, and 21,062 free colored persons. The principal collegiate and professional schools in the state in 1859 were Washington college at Chestertown; St. John's college at Annapolis; St. Mary's college at Baltimore; St. Charles's college at Ellicott's Mills; Mount St. Mary's college at Emmittsburg; college of St. James in Washington co.; St. John's college at Frederic City; St. Mary's theological seminary at Baltimore; Mt. St. Mary's theological seminary at Emmittsburg; novitiate of the society of Jesus at Frederic City; St. Charles seminary at Ellicott's Mills; medical department of the university of Maryland at Baltimore; Washington medical college at Baltimore; and the college of dental surgery at Baltimore. The number of churches of all denominations in 1850 was 909, with accommodations for 370,465 persons, and valued as property at \$3,947,884. Of these, 45 were Baptist, 133 Episcopal, 6 Free, 26 Friends', 22 German Reformed, 40 Lutheran, 479 Methodist, 56 Presbyterian, 65 Roman Catholic, and 37 other denominations. The Methodist churches had accommodation for 181,715, the Episcopal for 60,105, the Roman Catholic for 31,100, the Lutheran for 24,700, the Presbyterian for 22,635, the Baptist for 15,950, the German Reformed for 14,800, and the Friends' for 7,760. The number of newspapers and periodicals published in 1850 was 68, circulating annually 19,612,724 copies; of these, 6 (15,806,500 copies) were daily, 4 (499,700 copies) tri-weekly, 54 (8,166,124 copies) weekly, 1 (48,000 copies) semi-monthly, and 3 (92,400 copies) monthly; and 20 (14,654,000 copies) were literary and miscellaneous, 1 (8,400 copies) neutral and independent, 39 (4,196,924 copies) political, 6 (669,400 copies) religious, and 2 (84,000 copies) scientific. The libraries other than private numbered 124, with an aggregate of 125,042 volumes, of which 17 (54,750 vols.) were public, 8 (6,335 vols.) school, 64 (28,315 vols.) Sunday school, 10 (33,792 vols.) college, and 5 (1,850 vols.) church libraries. The whole number of paupers supported in whole or in part within the census year was 4,494, and the number receiving aid on June 1, 1850, was 2,001; cost of support for the year, \$71,668. Criminals convicted within the year, 207; in prison, June 1, 1850, 397.—The first settlement in Maryland was made by Capt. William Clayborne with a party of men from Virginia on Kent island, Chesapeake bay, in 1631. But the charter under which the colony was permanently established was granted to Cecilius Calvert, 2d Lord Baltimore, by Charles I., and was dated June 20, 1632. The province covered by this grant had been partially explored by Sir George Calvert, father of the grantee, 4 years before. It was named in the charter *Terra Maria*, "Mary's Land," in honor of Queen Henrietta Maria. The expedition designed to commence the settlement sailed from

the isle of Wight Nov. 22, 1633, in two vessels named the Ark and the Dove. The emigrants formed a body of 200 persons, and were nearly all Roman Catholics and gentlemen of fortune and respectability. They landed on St. Clement's island, March 25, 1634, and two days afterward commenced a settlement at St. Mary's on the mainland, whence they bear in our annals the title of "pilgrims of St. Mary's." Leonard Calvert, brother of the lord proprietary, who had conducted the colony from England, became its first governor. A year or two after landing he turned his attention toward Olayborne's settlement; but Clayborne refused to acknowledge himself subject to the new government, and was at length expelled along with his most active adherents. Beyond this and a few slight disturbances with the Indians, nothing occurred for some years to check the prosperity of the settlement. The first legislature met in 1639. In 1642 a company of Puritans, who had been expelled from Virginia for non-conformity, settled in Maryland, and soon began to manifest a spirit of resistance to the authority of the proprietary. Olayborne also had returned from his exile and regained possession of Kent island. The efforts of the governor to dispossess him not only failed, but Olayborne and his partisans, with the Puritan party, made themselves complete masters of the province, and compelled the governor in his turn to fly into Virginia. This event occurred in 1644. In 1646, however, the governor returned at the head of a military force and recovered possession. In 1649 the assembly passed that noble act which conferred on the colony the title of "land of the sanctuary." By this act Christians of all sects were secured in the public profession of their faith, and allowed to worship God according to the dictates of their own consciences. The Puritans, whose arrival in the colony has already been noticed, settled at Providence, which at a later period received the name of Annapolis, and became the seat of government. They still proved turbulent, and as a means of conciliating them their settlement was erected in 1650 into a separate county under the name of Anne Arundel; and still additional members of this denomination arriving from England, Charles county was organized for them a short time afterward. From this time they began to exercise a controlling influence in public affairs. On the overthrow of the royal government and the establishment of the commonwealth in England, their party insisted upon an immediate recognition of the new order of things. The authorities, however, proceeded to proclaim Charles II. But in the next assembly it was found that the Puritans had a majority; and in 1652 commissioners from England visited Maryland, with whom were associated Clayborne, the old opponent of the proprietary government, and Bennett, the leader of the Puritans of Anne Arundel county. They removed Gov. Stone, and completely established the authority of the commonwealth. Kent island was once more delivered up to Clay-

borne, and he acquired also Palmer island at the mouth of the Susquehanna. In 1654 Lord Baltimore made a determined effort to regain possession of the province, and having succeeded reinstated Gov. Stone; but Bennett and Olayborne, the former of whom was now governor of Virginia, again interfered, and reversed all that Lord Baltimore had accomplished. They established a commission for the government of the colony, and placed Capt. Fuller at its head. Hereupon a civil contest ensued, and hostilities were carried on by land and water. Providence was attacked by the proprietary party, but the Puritans were victorious, and killed or captured the whole invading force. Many of the captives, among whom was Gov. Stone, were condemned to death, and at least 4 of them were executed. This decisive action was fought March 25, 1655. Three years after, however, the power of the proprietary was restored, and his brother Philip Calvert appointed governor. In 1660, 26 years from the foundation of the colony, the population was 12,000; and in 1671 it had increased to 20,000. There were yet no considerable towns. St. Mary's contained only 50 or 60 houses, and Providence was still smaller. In 1662 the Hon. Charles Calvert, son of the lord proprietary, was appointed governor, and so continued until 1665, when on the death of his father he succeeded to his rights, and appointed Thomas Notely his representative. After the revolution of 1688 the government was assumed by King William, and in 1691 Sir Lionel Copley was sent out as governor. Among the first acts of importance under the new government was the removal of the capital to Providence, which was thenceforth known as Annapolis. In 1695 the first post route was established, and extended from the Potomac through Annapolis to Philadelphia. The mail carrier was required to traverse it 8 times a year, and for his services to receive £50 per annum. In 1714 Benedict Charles Calvert succeeded on the death of his father to his hereditary rights, and having been educated a Protestant, the principal obstacle to the recognition of the claim of this family was removed; and the next year the authority of the proprietary was restored throughout the colony after a suspension of 24 years. Hart, the last of the royal governors, was continued in office. In 1729 Baltimore was laid out. In 1745 the "Maryland Gazette," the first newspaper printed in Maryland, was established at Annapolis, and continued to be issued by the descendants of Thomas Green, its founder, until 1839. Frederic City was founded in 1745, and was so named after the son and successor of the then proprietary. Georgetown, now in the district of Columbia, was laid out in 1751, and, being at the head of the navigation of the Potomac, grew rapidly in population and trade. The population of the province in 1748 was estimated at 180,000, of whom 86,000 were blacks. Eight years later the computation was 154,188. The policy of the English government was to repress all efforts to establish

manufactures; but in 1742 there were copper works in operation, and in 1749 8 furnaces and 9 forges; and wine was produced to a considerable extent. The great staple export, however, was tobacco, of which 80,000 hogsheads were exported annually, and for many purposes tobacco was the currency of the province. In 1782 it was made a legal tender at one penny a pound. Almost from the date of the foundation of the colony disputes with the neighboring provinces regarding boundaries had been a serious cause of disquiet. These were at length decided by the appointment of Mason and Dixon in 1750 to survey the line between Pennsylvania and Maryland. (See MASON AND DIXON'S LINE.) In the long and bloody contest which annihilated the French dominion in America, Maryland bore an active part. Braddock's expedition against Fort Duquesne was organized in this province in 1754; and from this time to 1758, when the fort was finally taken, the western parts of Maryland were kept in constant terror, and large numbers sought refuge in Baltimore and other coast towns. The stamp act and the tea duty act were alike opposed by the people of Maryland, and the proprietary government was superseded by committees of public safety and conventions of the whole people. In Aug. 1776, a convention assembled, and in September presented a bill of rights and a constitution, which were adopted in November. The first elected legislature assembled at Annapolis, Feb. 5, 1777, and on the 13th Thomas Johnson was chosen the first republican governor. Throughout the war the Maryland troops were remarkably efficient, and under the title of the "Maryland line" took a high position in the continental army. They took part in the battles of Long island, Harlem heights, White Plains, Trenton, Princeton, &c.; and indeed, with the exception of the actions in the campaign against Burgoyne, there was no prominent battle of the war, from that of Brooklyn heights to Yorktown, in which the troops of Maryland did not take an honorable part. On Dec. 23, 1783, Washington resigned his commission to the congress assembled at Annapolis. Attention was now turned to the development of the resources of the state and western settlements; and at a meeting of commissioners of Virginia and Maryland appointed for this purpose in 1784, it was proposed that the two states should unite their efforts to render the Potomac navigable by means of locks and dams, and that to connect its head waters with the Ohio a road 40 m. long should be constructed. The "Potomac company" was chartered, and Gen. Washington became its first president; but though something was done toward carrying these designs into effect, their complete accomplishment was reserved for a later date. The federal constitution was adopted in the Maryland convention by a vote of 63 to 11. During the war of 1812, Admiral Cockburn, the British naval officer, committed a series of depredations on the shores of the Chesapeake bay, and plundered

and burned Frenchtown, Havre de Grace, Fredericktown, and Georgetown. The Maryland militia opposed the march of the British to Washington in 1814, but without effect. In the same year was fought the battle of North Point, in which the British general Ross was killed, and the Americans gained a slight advantage; and on the next day (Sept. 14) the invaders began an attack upon Baltimore by the bombardment of Fort McHenry. The defence was bravely conducted, and on the 16th the British fleet weighed anchor and made sail down the bay. On the return of peace the citizens once more turned their attention to the riches of the West. Experience had proved the impracticability of rendering the Potomac navigable as proposed by the company formed in 1784; and it necessarily gave place to a much greater and more expensive work. The Chesapeake and Ohio canal was suggested, and the design approved of by Maryland, Pennsylvania, and Virginia. The work was undertaken by a company formed in 1828. In the year previous measures had been taken to secure the building of a railroad from Baltimore to Cumberland. The state favored this project, and subscribed largely to its stock. Many other improvements were now projected. Railroads were undertaken from Baltimore to York, Penn.; from Baltimore to Washington, with a lateral branch to Annapolis, &c. Some of these were commenced with the aid of means furnished from the treasury, and during their construction large sums of the public money were advanced; such are the bases of the present public debt. All these are now completed, and paying the interest on the bonds issued in their behalf. By these the coal of Cumberland is brought to the cities of the district and to Baltimore, and distributed to the towns along the lines; the whole interior is opened to the Baltimore market; and the vast physical disabilities under which the commercial metropolis originally labored have been removed. The progress of commerce since the completion of these works is shown in a table heretofore given. In 1851 the constitution of the state was remodelled.

MARYSVILLE, the capital of Yuba co., Cal on the N. bank of the Yuba river, 1 m. above its junction with Feather river, 100 m. N. N. W. from Benicia, and 50 m. N. from Sacramento. pop. in 1858 estimated at 8,000. In the rainy season the population is greatly increased by the influx of miners. It contains seven churches, Baptist, Episcopal, Methodist, Presbyterian, and Roman Catholic. It has regular steamboat communication with San Francisco.

MASACCIO, or more properly TOMMASO GUIDI, a Florentine painter, born at San Giovanni, between Florence and Arezzo, in the early part of the 15th century, died in 1444. He is said to have been a pupil of Masolino and Panicali, and from the outset of his career he neglected of all the external relations of life, in his exclusive devotion to art, procured him the name of Tommasaccio or Masaccio, which

means literally "slovenly Thomas." While a young man he appears to have visited Rome, and to have painted there in the chapel of Sta. Caterina in the church of S. Clemente a series of frescoes from the life of St. Catharine, and other subjects, which are the earliest works ascribed to him with any certainty. Time and the efforts of restorers have left few traces of Masaccio's hand in these, except the composition; but from the engravings which exist some idea can be formed of their original simplicity and beauty. The frescoes illustrating the life of St. Peter, which he painted in the Brancacci chapel of the Carmelite church in Florence, are much more important, having been the means of introducing a marked improvement in painting, and of promoting the splendid culmination of art which marked the close of the 15th century and the commencement of the 16th. The frescoes in this chapel are comprised in 12 compartments, 2 of which were painted by Masolino and 6 by Masaccio, while the remaining 4 were completed many years afterward by Filippino Lippi. Masaccio's subjects were the "Expulsion of Adam and Eve from Paradise," the "Tribute Money," "Peter raising a Youth to Life," "Peter and John healing the Cripple," "Peter and John distributing Alms," and "Peter baptizing Converts." No painter had previously infused so much individual character into his works, or so carefully studied the bodily conformation of man. Neither the representation of the event, nor the manifestation of his own feelings through the medium of forms and expressions, seems to have been the exclusive aim of the artist; but he has attempted to depict the human figure as it looks and moves, wholly regardless of any conventional type adopted by his predecessors. An illustration of this is afforded in the fresco of St. Peter baptizing the converts, in which a young man who has thrown off his garment seems to be shivering with sudden cold. The naturalness of the attitude awakened the admiration of contemporaneous artists to such a degree, that Lanzi says: "The figure formed an epoch in art." The animation and variety of character in the heads, the roundness and relief of the limbs and bodies, the draperies seemingly dependent only on the form beneath, and yet falling in grand and simple folds, and above all perhaps the powerful feeling for truth and individuality which the composition evinced, gave additional interest to these works; and for half a century after the death of Masaccio the Brancacci chapel was visited by painters as the repository of the most precious models for study. Among those who were accustomed to resort there, Vasari enumerates Leonardo da Vinci, Michel Angelo, Andrea del Sarto, Perugino, and Raphael, all of whom derived the germ of their several styles from the contemplation of Masaccio's frescoes. The superiority of Masaccio over all previous painters is attributed chiefly to his early studies in modelling, as also in chiaroscuro and perspective. He was the first who successfully fore-

shortened the extremities of his figures, and his drawing and coloring of the naked figure were only surpassed by Raphael, Titian, and a few of their contemporaries. Little is known of his easel pictures, although some fine heads are attributed to him. Several of these are in Florence; and two pictures in the Liverpool institution have been attributed to him, though Wagler denies it. Of the artist who achieved this revolution in art little else is known, save that he died suddenly and in a suspicious manner, and is buried in the Brancacci chapel. Much perplexity exists as to the date of his birth, which has been variously stated at 1401, 1402, and 1417, the first from various circumstances probably being nearest the truth, though the paucity of his works would lead one to suppose that he died young.

MASAYA, a town of Nicaragua, 12 m. N. W. from the city of Granada; pop. 15,000, chiefly Indians. It is in the centre of a very fertile district, and is distinguished for the general industry and thrift of its inhabitants, who are largely engaged in the manufacture of hats, saddles, hammocks, cordage, &c. The town sustained great damage from an attack by Gen. Walker in 1856, from which however it is rapidly recovering. In the vicinity is a lake of the same name, on the N. W. border of which rises the volcano of Masaya. The latter is a broad, low mountain, not more than 8,500 feet in height, with one large and several minor craters. It was in active eruption at the time of the conquest in 1527, when it was known as one of the wonders of the new world, under the designation of *El Infierno de Masaya*, or the Hell of Masaya. Vast lava beds, some of very ancient and others of comparatively later date, cover the country around it for many miles in every direction, and attest its fearful activity in times past. Its last eruption was in 1670, when it sent out a vast flood of lava, which flowed down in the direction of Lake Managua for a distance of more than 20 miles. This great lava field resembles an ocean of ink suddenly congealed in a storm. During the past 8 years the volcano, after a long period of repose, has exhibited signs of renewed activity, and now (1860) sends out great volumes of smoke, which at night are illuminated from below with a lurid glare like that of a furnace. Serious fears are entertained of an eruption.

MASCAGNI, PAOLO, an Italian anatomist, born at Castelleto, near Sienna, in 1752, died in Florence, Oct. 19, 1815. He became professor of anatomy at the university of Sienna in 1774, and in 1784 obtained a prize from the French academy of sciences for his *Prodrome d'un ouvrage sur le système des caisses lymphatiques*. In 1787 appeared his most important work, *Vasorum Lymphaticorum Corporis Humani Historia et Iconographia*. After officiating for a short time at the university of Pisa, he was attached from 1801 till his death to the hospital of Santa Maria at Florence as

professor of anatomy, physiology, and chemistry. His posthumous works are: *Anatomia per uso degli studiosi di scultura e pittura* (Florence, 1816), and *Anatomia universa*, with illustrations (Pisa, 1828-'31).

MASÈRES, FRANÇOIS, commonly called Baron Masères, an English mathematician, born in London, Dec. 15, 1781, died at Reigate, May 19, 1824. His grandfather, exiled from France by the revocation of the edict of Nantes, went to England with William of Orange. He was educated at Cambridge, attained the first place both in the classics and mathematics, studied law, and after a few years' practice was appointed attorney-general for Canada, and resided in Quebec till 1778. After his return to England he recommended conciliatory measures with the American colonies, and was appointed to the sinecure office of cursitor baron of the exchequer, which he held during the remainder of his life. He matured a plan for securing small pensions from government to such of the poorer classes as should make certain contributions while having health and vigor. It was embodied in a bill, which passed the commons, but was lost in the house of lords through the influence of the bishops. Baron Masères made valuable contributions to science, not only by his own writings but by his munificence in publishing the works of others. When a young man (1758) he wrote a treatise against the abuse of the negative sign in algebra, which he regarded as the principal cause of the incorrect and vague language then prevalent among algebraists. He also wrote on the "Elements of Plane Trigonometry" (1750), a learned treatise on "Life Annuities" (1783), and numerous papers in the "Philosophical Transactions," all of which are extremely prolix on account of his rejection of algebraic formulas. He published a collection of the principal writings on logarithms, under the title of *Scriptores Logarithmici* (6 vols., 1791-1807), in which he interspersed many original tracts; and a similar collection of works on optics, entitled *Scriptores Optici* (1828).

MASHAM, ABIGAIL, lady, an Englishwoman of much political influence in the reign of Queen Anne, born about the year 1670, died Dec. 6, 1734. The place of her birth is not known, but probably it was London, where her father, Francis Hill, was a Turkey merchant. Mr. Hill is said by the duchess of Marlborough to have been a connection of Robert Harley, afterward earl of Oxford. He married a sister of the duchess, a Miss Jennings, and was of good station until he ruined himself by becoming a "projector," or speculator. Abigail, his eldest daughter, then became a waiting woman to the wife of Sir John Rivers, a Kentish baronet. When Lady Marlborough came to a knowledge of the poverty of her relatives, the Hills, she afforded them great assistance. Money was given to Mrs. Hill; her daughter Mary was made laundress to the duke of Gloucester, son of the princess Anne; one of her sons was

placed in the customs, and another made a page to the prince of Denmark; and Abigail was appointed bedchamber woman to the princess. Many other favors were conferred upon the Hills by the Churchills; but the arrogance of Lady Marlborough was so great that she probably offended all the recipients of her bounty, and prepared the way for an apparent act of signal ingratitude, which potently affected the history of Europe. Availing herself of her confidential position in the service of Anne, who had become queen, Abigail Hill was steadily undermining the duchess of Marlborough at court, an undertaking which she found all the more easy because of the queen's hatred of the duchess. Samuel Masham, a gentleman of the bedchamber to the prince of Denmark, became attached to Abigail, and the queen was the confidant of their courtship, of which the Marlboroughs knew nothing. Harley was another confidant. Anne was present at their marriage, which took place in 1707. The Marlboroughs were astonished. After a long and bitter struggle, the Marlborough influence was overthrown, the whig ministry was dismissed, and the tories came into power, made the treaty of Utrecht with Louis XIV., and put an end to that brilliant war which had reduced France to the lowest point of distress, and which, had it been continued, must have brought the Bourbon rule of the Spanish empire to a rapid end. All this was the work of Mrs. Masham, without whose influence over the queen's mind the war party could not have been broken down. At the close of 1711 Mr. Masham was made Baron Masham of Otes, being one of the 12 peers created to enable the tory ministers to force their measures through the house of lords. He was of higher family than his wife, being a younger son of Sir Francis Masham, descended from George, duke of Clarence, brother of Edward IV., and a distant relative of the Cromwell family. He was a general, and held several offices at the court and sinecure appointments. In the quarrel that took place between Oxford and Bolingbroke, Lady Masham sided with the latter, and was as bitter an enemy of that relative as of the Marlboroughs. On the death of Queen Anne in 1714, her court favor came to an end, as the whigs came into power on the accession of George I., and she and her husband retired to their seat at Otes. Lady Masham's character has been drawn by partisans only, and it is difficult to arrive at a correct conclusion respecting it; but it is not possible that a dull illiterate woman, as she has been represented to be, could have played the important part that fell to her lot, and which was very successful against powerful factions, interests, and individuals.

MASINISSA, or MASSINISSA, a king of Numidia, born about 240, died in 148 B. C. He was the son of Gala, king of the Massylians, the most powerful tribe in E. Numidia, and received a superior education at Carthage, which when he reached the age of manhood commen-

ced its second great struggle against Rome, under the lead of Hannibal. The diplomacy of Hasdrubal, the son of Gisco, who promised the hand of his beautiful daughter Sophonisba to the young prince, prevailed on the king of the Massylians to conclude an alliance with Carthage, and to declare war against Syphax, king of the Massesylians, a rival Numidian tribe, who had espoused the cause of the Romans. Masinissa commanded his father's army, routed Syphax (218), and subsequently crossed over to Spain, where he gallantly fought with the Carthaginian generals, the Numidian horse greatly contributing to the final defeat of the brothers Cneius and Publius Scipio, until the arrival of the son of Publius, afterward known as Scipio Africanus the elder, suddenly turned the scale of fortune. Scipio was no less able as a diplomatist than as a general, and his timely return of Massiva, the captive nephew of the Numidian, to his uncle with presents and a courteous message, paved the way for a secret understanding with the latter, which proved disastrous to Carthage when Scipio finally carried the war into Africa. Another and perhaps more powerful reason for Masinissa's defection was the circumstance that Hasdrubal, in order to gain over Syphax, broke his promise and married Sophonisba to the latter. Returning to Africa, where his father and elder brother had in the mean while died, Masinissa reconquered his kingdom from a usurper, but was soon attacked by the betrayed Carthaginians and their new ally, was repeatedly routed, and saved his life by flight. At this juncture Scipio landed in Africa (204), and Masinissa was enabled not only to regain his possessions, but while assisting his victorious allies, jointly with Lælius, one of their commanders, took Oirta, the capital of his rival Syphax. Sophonisba became his captive, and soon his wife. But afraid of the influence of Hasdrubal's daughter, whose patriotism equalled her charms, over her new consort, Scipio severely reprimanded Masinissa, and asked the surrender of the Carthaginian woman as a captive of Rome. Unable or unwilling, at the risk of his power, to defend the freedom of his wife, Masinissa saved her from the ignominy of Roman captivity by sending her a cup of poison, which she drank without hesitation. Syphax was sent to Italy, where he shortly after died. In spite of his tragic loss, Masinissa from ambition persisted in his fidelity to Rome, and his aid contributed not a little to the issue of the terrible battle of Zama (202), in which he commanded the cavalry on the right wing of Scipio's army, and which terminated with the rout of Hannibal. Peace was concluded soon after (201), and Masinissa was rewarded by the victors with a part of the territories of Syphax. He now reigned in peace for 50 years, developing the resources of his kingdom by the promotion of agriculture, and extending its limits by annexations from the possessions of Carthage, which were approved of by the partial senate of Rome, and in consequence of which a few

years before his death he entered once more the field of battle. Scipio Africanus the younger from a hill witnessed the last victory of the Numidian, who, though above 90 years of age, not only possessed all his pristine energy, but also mounted his horse with the agility of a youth. His defeat of the Carthaginians made it easier for the Romans subsequently to conquer them; and the last Punic war commenced soon after, in the second year of which Masinissa died, leaving his possessions to be divided by his friend Scipio among his 3 legitimate sons Micipsa, Gulussa, and Mastanabal, with rich donations to their very numerous illegitimate brothers.

MASKELYNE, NEVIL, an English astronomer, born in London, Oct. 6, 1732, died in Greenwich, Feb. 9, 1811. He was graduated at Cambridge in 1754, was admitted to orders, officiated for some time as curate, and obtained a fellowship in 1756. In 1758 he became a fellow of the royal society and a contributor to its "Philosophical Transactions" on astronomical subjects. He was sent by that body to St. Helena in 1761, to observe the transit of Venus. Soon after returning he was placed as chaplain on board the Princess Louisa, in order that he might proceed to Barbados, and test the merits of Harrison's new chronometers and Irvine's marine chair. In 1765 he succeeded Mr. Bliss as astronomer royal at Greenwich. He superintended the "Nautical Almanac," established at his suggestion, from 1767 till his death. He was the first to publish what is termed "a standard catalogue of stars," and Delambre dates the commencement of accurate astronomical observation from his installation at Greenwich.

MASON. I. A W. co. of Va., bounded N. and W. by the Ohio river, and drained by the Great Kanawha and its tributaries; area, 300 sq. m.; pop. in 1850, 7,539, of whom 647 were slaves. It has a diversified surface and fertile soil, and contains iron ore, coal, and valuable salt springs. The productions in 1850 were 20,545 bushels of wheat, 899,080 of Indian corn, 11,100 lbs. of tobacco, and 23,607 of wool. There were 7 grist mills, 4 saw mills, 4 tanneries, 12 churches, and 1,150 pupils attending public schools. Value of real estate in 1856, \$2,758,827; increase since 1850, 51 per cent. Capital, Point Pleasant. II. A N. E. co. of Ky., bordering on the Ohio river, intersected by the N. fork of Licking river, and drained by Limestone and Lee's creeks; area, 236 sq. m.; pop. in 1850, 18,344, of whom 4,284 were slaves. The surface is diversified, hilly toward the N., and the soil fertile. The productions in 1850 were 978,470 bushels of Indian corn, 50,236 of oats, 2,492,622 lbs. of tobacco, 47,140 of wool, and 1,853 tons of hemp. There were 37 grist mills, 11 saw mills, 2 woollen factories, 7 tanneries, 35 churches, and 542 pupils attending public schools. Capital, Washington. III. A W. co. of Mich. (formerly Notipeskago), bordering

on Lake Michigan, and drained by the Notipeskago, Marquette, and Great and Little Sable; area, 460 sq. m.; pop. in 1850, 98. Its surface is generally level and the soil fertile. IV. A central co. of Ill., bounded N. W. by the Illinois and S. by the Sangamon; area, 580 sq. m.; pop. in 1855, 7,775. The surface is low, and the soil, which is mostly prairie, very fertile. The productions in 1850 were 142,474 bushels of wheat, 555,610 of Indian corn, 70,400 of oats, and 10,284 lbs. of wool. Capital, Havana.

MASON, the name of a distinguished family in Virginia. The first of the family who came to North America was Col. GEORGE MASON, a member of the English parliament in the reign of Charles I. Though he opposed with great eloquence the arbitrary policy of the king, he also resisted the extreme measures resorted to against him, and subsequently became an officer in the army of Charles II. When the royalist army was defeated at Worcester by Cromwell in 1651, he made his escape disguised as a peasant, and embarking for America landed at Norfolk, Va. He lost all his possessions in England. His great-grandson, of the same name, married, about 1726, Anne Thomson, a favorite niece of Sir William Temple, and had by her two sons and a daughter. I. GEORGE, eldest son of George and Anne Thomson, born at Doeg's Neck, then in Stafford, now in Fairfax co., Va., in 1726, died in the autumn of 1792. He married Ann Eilbeck of Charles co., Md., and after his marriage built Gunston hall, on the banks of the Potomac, in which he resided till his death. In 1769 he drew up the non-importation resolutions which were presented by Washington in the assembly of Virginia, and unanimously adopted. These resolutions included one not to import or purchase any imported slaves after the first day of November. Mr. Mason was not at that time a member of the house. In 1775 the convention of Virginia desired to elect him a delegate to congress. The acceptance of the office was urged upon him in the warmest manner by Jefferson, Patrick Henry, and other leading members, and by the president of the convention, Peyton Randolph, who wept while Mason was making his speech of declination. The cause of his refusal to serve was the recent death of his wife, leaving a large family of children. He nominated in place of himself Col. Francis Lightfoot Lee, who was elected. The convention then made him a member of the committee of safety charged with the executive government of the colony, and this post he reluctantly accepted. In 1776 he drafted the declaration of rights and the constitution of Virginia, which were adopted by a unanimous vote. He was at this time 50 years of age, and is described as of commanding presence and lofty bearing, his stature nearly 6 feet, his frame athletic and robust, his complexion swarthy, his black hair sprinkled with gray, and his face grave, with radiant dark eyes. Mr. Madison pronounced him the ablest man in debate that he had ever seen. His talents for

discussion, as well as his liberal spirit, were eminently displayed in the warm debates which sprung up in the first legislature under the new constitution, about a measure which he brought forward and carried through in conjunction with Jefferson, for the repeal of all the old disabling acts, and for legalizing all modes of worship, releasing dissenters from parish rates, and suspending their collection until the next session, a suspension made perpetual 8 years later. The assembly appointed him, with Jefferson, Pendleton, Wythe, and F. L. Lee, a committee to revise the laws; but he declined to accept the appointment. In 1777 he was elected a member of the continental congress. Ten years later he was a member of the federal convention to frame the constitution of the United States. He took a leading part in the debates of this distinguished body, and always on the liberal and democratic side. In the discussion on the question whether the house of representatives should be chosen directly by the people, he maintained that no republican government could stand without popular confidence, and that confidence could only be secured by giving to the people the election of one branch of the legislature. He favored the election of the president directly by the people and for a term of 7 years, with ineligibility afterward. The attempt to secure for the national legislature a veto upon all state laws was opposed by him, and also the propositions to make slaves equal to freemen as a basis for representation, and to require a property qualification from voters. He spoke with great energy against the clause in the constitution which prohibited the abolition of the slave trade till 1808, declaring that slavery was a source of national weakness and demoralization, and it was therefore essential that the general government should have power to prevent its increase. In some of his attempts to render the constitution more democratic Mr. Mason was defeated in the convention; and when the instrument was completed he declined to sign it, declaring his apprehensions that it would result in a monarchy or a tyrannical aristocracy. He was especially dissatisfied with the extended and indefinite powers conferred on congress and the executive. Returning to Virginia, he was chosen a member of the convention called to ratify or reject the federal constitution, and in conjunction with Patrick Henry he led the opposition to the constitution in that body, insisting at least on its ratification subject to certain amendments; and in this form only could the ratification be carried. The amendments proposed by him were a bill of rights and some 20 alterations in the body of the constitution, several of which were afterward adopted by congress and the states. Mr. Mason was elected the first U. S. senator from Virginia under the constitution, but he declined to accept the office. He lived for 8 years longer in retirement at Gunston hall, devoting his leisure to study and amusing himself with hunting and fishing, of which he was extremely fond.

He held at his death the first rank among the great men of Virginia. Jefferson says of him : "He was a man of the first order of wisdom, of expansive mind, profound judgment, cogent in argument, learned in the lore of our former constitution, and earnest for the republican change on democratic principles." His statue stands with those of Jefferson, Henry, and other illustrious Virginians, at the base of Crawford's colossal statue of Washington in front of the capitol at Richmond. II. THOMSON, younger brother of the preceding, born in 1780, died in 1785. He studied law in the Temple at London, and became one of the most eminent jurists of his day. He was no less ardent in his patriotism and love of republican institutions than his brother. He took strong ground against the aggressions of the British government, and as early as 1774 published a series of masterly papers in which he maintained the duty of open resistance to the mother country. The first numbers of these papers appeared under the signature of a "British American," but in the concluding one he made known his real name with a degree of courage and beauty of style not surpassed by the declaration of independence itself. In 1778 he was appointed a member of the first supreme court of Virginia, but did not long act as such. He with his brother was nominated by the senate one of the revisers of the laws of Virginia. In 1779 he was elected a member of the house of delegates for Elizabeth City county; but having after his election changed his residence to another county, he sent in his resignation. The house, however, would not accept it. He was again a member in 1783, and served as chairman of the committee on courts of justice. III. STEVENS THOMSON, eldest son of the preceding, born in Stafford, Va., in 1761, died in Philadelphia in 1808. At the age of 30 he reached the rank of colonel in the revolutionary army, and served with distinction at the close of the war. He was a conspicuous member of the Virginia convention in 1788, and was a member of the U. S. senate from 1794 until his death. He was possessed of great powers of oratory, wit, and sarcasm, and enjoyed great personal popularity. IV. JOHN THOMSON, brother of the preceding, born in Stafford in 1764, died in Dec. 1824. He adopted the profession of the law, and in early life emigrated to Maryland, where he attained the first rank in his profession. The appointment of attorney-general of the United States was tendered to him by Mr. Jefferson (of whom he was a warm supporter and devoted personal friend), and in 1804, by the state of Maryland, the offices of chief justice and attorney-general, all of which he declined, or filled but for a brief period. In 1811, upon the resignation of Mr. Rodney as attorney-general, President Madison offered the place to Mr. Mason, but he declined it. In 1816 he was the democratic candidate for U. S. senator against Robert G. Harper; and although the legislature was largely federal, he lost the election by only a single vote. V. JOHN THOMAS, son of the preceding, born in Washing-

ton co., Md., in 1815. He was bred to the bar, and early in life was elected to the Maryland legislature, where he served for several years. Afterward, and before he had attained the age of 26, he was elected a member of congress, and was the youngest member of that body. In 1851 he was elected a member of the court of appeals of Maryland. After serving a number of years he resigned, and was appointed by President Buchanan collector of the port of Baltimore, which position he still fills. VI. ARMSTRONG THOMSON, son of S. T. Mason, born in Loudon co., Va., in 1787, killed Feb. 5, 1819. He served with distinction during the second war with Great Britain as colonel of a regiment of horse, and was subsequently a brigadier-general of the Virginia militia. He had been a member of the Virginia legislature, and in 1815 was elected to the U. S. senate, where he served till 1817, when he resigned, at the instance of his friends, to run for the house of representatives in the strong federal district of Loudon. It was supposed that he alone, on account of his great personal popularity, could break down the federal champion of that district, Charles Fenton Mercer, and hence he made the sacrifice of resigning an office of greater dignity to run for one of lesser. He was defeated by a small majority. The contest was one of great personal bitterness, and resulted in a number of duels; among them was the famous conflict in which he himself was involved with his cousin Col. John Mason McCarty, and which ended his brilliant career at the age of 32. They fought with muskets near Bladensburg, and upon the first fire he fell mortally wounded, and died before he was removed from the field. He left an only child, Stevens Thomson, who subsequently volunteered in the Mexican war, and as a captain of the mounted rifles fell, mortally wounded, while making a gallant charge upon the enemy at Cerro Gordo. VII. RICHARD B., grandson of Col. George Mason, an officer of the U. S. army, died at Jefferson barracks in 1850. He served for a time as colonel of dragoons, but was breveted brigadier-general in 1848 for "meritorious and distinguished" services in the Mexican war. He was the first civil and military governor of California. VIII. JAMES MURRAY, also a grandson of Col. George Mason, born on Annapolis island, Fairfax co., Va., in 1797. He early settled in Winchester, Va., as a lawyer. For several years he was a member of the legislature, and in 1837 was elected to the U. S. house of representatives. For the last 14 years he has been a leading member of the U. S. senate from Virginia, and has been the chairman of the committee on foreign affairs for several years past. IX. STEVENS THOMSON, grandson of Stevens Thomson Mason, already mentioned, born in Loudon co., Va., in 1811, died in New York in Jan. 1843. His father, John T. Mason, removed to Kentucky, where the son was educated. In 1831 he was appointed by President Jackson secretary of the territory of Michigan, and in that capacity, upon the translation of

Gen. Cass, the governor, to the war department at Washington, he became the acting governor. It was during this period that the celebrated controversy commenced between Ohio and Michigan in regard to their boundary line. It excited the most intense interest and bitter feeling, and thousands of troops were marched to the line with the prospect of a sanguinary conflict.* Gov. Mason, through the whole controversy, until its final settlement, distinguished himself, though but a mere youth, by the calmness, ability, and courage with which he maintained the rights of Michigan. When Michigan became a state in 1835, Stevens Thomson Mason (then but 28 years of age) was unanimously elected her first governor, and was reelected for a second term. Upon retiring from office in 1839, he withdrew from political life, and removed to New York, where he entered on the practice of the law. X. JOHN Y., descended more remotely from the same stock as the above, born in Virginia about 1796, died in Paris, Oct. 4, 1859. He filled several positions of honor under the state government of Virginia, and was a representative in congress from 1831 to 1837, when he was appointed judge of the U. S. court for Virginia. He was secretary of the navy under President Tyler, and successively attorney-general and secretary of the navy under President Polk. By President Pierce he was appointed minister to France, where he continued until his death.

MASON, JEREMIAH, an American lawyer and statesman, born in Lebanon, Conn., April 27, 1768, died in Boston, Oct. 14, 1848. His father, Col. Jeremiah Mason, was an officer in the revolutionary army, and, among other services, commanded a company of minute men at the siege of Boston. He was graduated at Yale college in 1788, was admitted to the bar in June, 1791, and opened an office at Westmoreland, N. H. His practice soon became considerable, and in the autumn of 1794 he removed to Walpole, where he became, acquainted with Joseph Dennie and with William Coleman, editor of the New York "Evening Post." In the summer of 1797 he removed to Portsmouth, N. H., and soon became engaged in very extensive practice. In 1802 he was appointed attorney-general of New Hampshire. The late Jeremiah Smith was then at the bar, and he and Mr. Mason were constantly retained as opposing counsel; and he had also the opportunity of trying his powers with such antagonists as Samuel Dexter, Theophilus Parsons, and Joseph Story. In 1807 Mr. Webster removed to Portsmouth, and from that time he and Mr. Mason were on opposite sides in most of the important cases tried in New Hampshire; a fact which did not prevent the formation and growth of an intimate and affectionate friendship between them, which continued as long as they both lived. In politics he was always an earnest federalist; and though he never courted public office, and was exclusively devoted to his profession, yet such was the confidence reposed in his

abilities and his wisdom that in 1813 he was chosen to the U. S. senate, and took his seat in June of that year. He immediately assumed a leading part in the debates of that body on the exciting subjects connected with the war of 1812. He was with difficulty induced to prepare any of his speeches for the press, and the general reports were at that time imperfect. Those most fully written out by him were one on the embargo delivered in Feb. 1814, and another on the conscription bill delivered in Dec. 1815. Mr. Mason had no political ambition, and no taste for public life; and in 1817 he resigned his seat in the senate, and resumed the practice of his profession. He was afterward for several sessions a member of the legislature of New Hampshire, in which he took a leading share in the revision of the state code of legislation. He drafted the resolutions and report of the legislature on the Virginia resolutions touching the Missouri compromise. In the summer of 1832 he removed to Boston, being then 64 years old, and continued to practise in the courts till he entered his 70th year. He then retired from them, in accordance with a resolution formed long before, but still continued to be consulted as chamber counsel. Until within 4 days of his death he was apparently in vigorous health, and with mental powers unimpaired.—Mr. Mason was known to the public almost entirely as a lawyer; few men in our country of such commanding powers have confined themselves so exclusively to their profession. As a lawyer he had no superior and few equals among his contemporaries. He may have been excelled by such men as Chief Justice Parsons, Judge Story, or Mr. Webster in some particular faculty or power; but in the aggregation of accomplishments and gifts which make up the finished lawyer, he stood unrivalled and supreme upon the soil of New England. His learning was profound, various, and ready; his practical sagacity was never at fault; his presence of mind never forsook him; his judgment in the conduct of causes was unerring; and both in the examination and cross-examination of witnesses he was proverbially masterly. In the preparation of his cases he was indefatigable. He was not only a great lawyer himself, but he made good lawyers of those who were in the habit of practising with him, as associates or opponents. The thorough preparation which he enforced in all who ventured to cope with him was in itself a good professional training. He took no pains to acquire the renown of a great advocate; his genius disdained the artificial graces of rhetoric; but he always commanded the unbroken attention of the jury by his powerful logic, his lucid narrative, his acute penetration, and his skill in grouping and presenting the facts on which his cause rested. In this portion of his professional duties he was aided by his striking and commanding personal appearance; his stature, in his prime, reaching to the height of 6 feet 7 inches. But it would be doing Mr. Mason much injustice to represent him merely as a great lawyer. He

was a man of very large natural capacity, whom taste and temperament had confined within the limits of a profession. No one could converse with him, especially in his later years, without being struck with his penetrating sagacity and his ripe wisdom. His temperament was calm, tolerant, and genial. In his declining years he gladly encouraged the visits of promising young men, and acted upon Dr. Johnson's advice to keep his friendships in repair. He was a decided and practical believer in the gospel of Christ, and uniform in his observance of the ministrations of the church. He married in Nov. 1799, Mary, daughter of Col. David Means, of Amherst, N. H., and had a numerous family.

MASON, JOHN, major of the forces of Connecticut colony, and one of its early settlers, born in England in 1600, died in Norwich, Conn., in 1672. He received his military training in the Netherlands as a volunteer under Sir Thomas Fairfax, and about 1631-'2 emigrated to Dorchester, Mass., whence in 1635 he removed with a portion of the Dorchester company to Connecticut, and aided in founding the town of Windsor, on the Connecticut river. From the moment of their arrival the settlers were in constant dread of the Pequots, the most numerous and warlike tribe in New England, who inhabited a tract of country lying between the Pequot river, now called the Thames, and the territories of the Narragansets in Rhode Island. The slaughter of a party of whites at the neighboring settlement of Wethersfield in April, 1637, at length called for retaliatory measures; and at a general court convened at Hartford, Mason was commissioned, with a force of 90 men, to descend the Connecticut and attack the Pequots at the mouth of the Pequot river. Accompanied by 70 friendly Indians of the Mohegan tribe, under their sachem, Uncas, he reached the English fort at Saybrook, at the mouth of the Connecticut, in the middle of May, and thence, in opposition to the advice of his officers and to the directions of the general court, put off into Long Island sound, intending to follow the coast to the country of the Narragansets, and thence by a retrograde march along the shore fall upon his enemies unawares. On the 23d he effected a landing in Narraganset bay, near Point Judith, secured the cooperation of 200 Narraganset warriors, and having sent back his boats to meet him at the mouth of the Pequot, proceeded by quick marches to the Mystic river, the boundary line of the present towns of Groton and Stonington, in the neighborhood of which were the two principal forts of the Pequots. Although his Indian allies were now swelled in numbers to about 500, such was the terror with which the name of the Pequots inspired them that Mason was compelled to commence the attack almost unaided. About an hour before daybreak on the 26th he surprised the nearest fort, and, gaining an entrance within the palisades, fell sword in hand upon the enemy. But finding that it would prove a long and wearisome task to dis-

lodge the Indians, he set fire to their wigwams, which were soon wrapped in flames, the whites and their allies forming a circle around the fort to prevent the escape of the besieged. Between 600 and 700 Pequots perished in the conflagration or by the hands of their adversaries, 7 were captured, and 7 escaped. Of the English, 2 were killed and 20 wounded. The little band then took up their march to the mouth of the Pequot river, into which, to their great joy, they saw their vessels sail soon after. They were attacked on the way by 800 Indians from the other fort, who however soon retired. Mason, putting his wounded aboard the vessels, marched with a small party by land to Saybrook, where he was received "by Lieut. Gardiner with many great guns." A general rejoicing filled the colony; and for the purpose of following up the blow thus struck, Mason, aided by a party from Massachusetts, pursued the remnant of the Pequots, who had fled with their chief sachem, Sassacus, toward New York, killed and captured many more, and divided the few who remained in Connecticut between the Mohegans and Narragansets, stipulating that the very name of Pequot should become extinct. By these prompt measures a handful of whites was enabled within a few weeks to annihilate a powerful native tribe, and to secure a general peace with the Indians, which remained for 40 years unbroken. Subsequently Mason was appointed major of the colonial forces, which office he filled more than 80 years, and between 1660 and 1670 he was deputy governor of Connecticut. He was also for many years a magistrate. About 1647 he took up his residence in Saybrook, and thence removed in 1659 to Norwich, where he passed the remainder of his life. At the request of the general court of Connecticut, he prepared a brief account of the Pequot war, published by Increase Mather in 1677, and republished, with an introduction and notes by the Rev. Thomas Prince, at Boston, in 1736.—See his biography, by George E. Ellis, in "Sparks's American Biography," 2d series, vol. iii.

MASON, JOHN MITCHELL, D.D., an American divine, born in New York, March 19, 1770, died there, Dec. 26, 1829. His father was of Scotch birth, and pastor of an Associate Reformed church (a denomination formed by the union of two branches of seceders from the Scotch Presbyterian church) in New York. He was graduated at Columbia college in 1789, and after studying theology under his father's care for one year repaired in 1791 to the university of Edinburgh. He was there prominent especially as a speaker in the weekly meetings of the theological society, but was recalled in 1792 by intelligence of his father's death, and by an invitation to become his successor in his pastoral charge. He was installed in this office in 1793, and retained it for 17 years. His advocacy of frequent communion soon gave him prominence in the religious world. He published a pamphlet consisting of "Letters" on

this subject, which was widely distributed, and was generally effectual in inducing the Associate Reformed churches to relinquish their former practice of celebrating the communion but once or twice a year. He projected the plan of a theological seminary to be under the authority of his denomination, and again visited Great Britain for the purpose of obtaining contributions; and his pulpit efforts abroad gave him repute as one of the first preachers of the time. His plan was carried into effect, the seminary being established in New York city in 1804, and he was appointed its first professor of theology. In 1806 he projected the "Christian's Magazine," which he conducted for several years, and in which he carried on a controversy with Bishop Hobart. In 1810 he resigned his pastoral charge with the purpose of forming a new congregation. He preached during an interval in a Presbyterian church edifice, and established more intimate relations between his own and the Presbyterian congregation than were believed by some to be authorized by the constitution of the Associate Reformed church. The matter was brought before the synod in Philadelphia in 1811; and though a conciliatory resolution was passed, it was the occasion of Dr. Mason's "Plea for Sacramental Communion on Catholic Principles" (1816). While fulfilling the duties of pastor and professor, he accepted in 1811 the additional office of provost of Columbia college, and by his talents and energy raised that institution to a higher character than it had ever before possessed. To restore his health, impaired by excessive labor, he resigned this position in 1816, and made his third visit to Europe, travelling in England, France, Switzerland, and Italy. On his return in 1817 he resumed his pastoral charge, but it soon appeared that his constitution was fatally undermined, and his mental powers began gradually to decay. In 1821 he exchanged his pastorate for the presidency of Dickinson college, Carlisle, Penn.; but his health was inadequate even for the lighter duties of this position, and in 1824 he relinquished it and returned to New York to pass the remainder of his life in retirement among his friends. He had in 1822 been one of those who transferred their connection from the Associate Reformed to the Presbyterian church. His published discourses convey but an imperfect idea of the powerful eloquence for which he was celebrated. A collection of his works, consisting chiefly of sermons and orations, was edited by his son, the Rev. Ebenezer Mason (4 vols., New York, 1832; new ed., with additions, 1849).

MASON, LOWELL, Mus. Doc., an American musical teacher and composer, born in Medfield, Mass., Jan. 8, 1792. From childhood he manifested great fondness for music, and at a very early age he commenced teaching it. In 1812 he removed to Savannah, Ga., where, in connection with other pursuits, he devoted much time to giving instruction and leading choirs and musical associations. In 1821, the "Boston

Handel and Haydn Collection of Church Music," his first essay in the compilation of church music, was published; and its success led to overtures to him to remove to Boston. The proposal was accepted; and in 1827 he left Savannah, and commenced in Boston the instruction of classes in vocal music, devoting special attention to the training of children to the performance of the alto part in choral music, and to the introduction of vocal music into the public schools. About 1828 Mr. William C. Woodbridge called his attention to the Pestalozzian method of teaching music, and especially to the various improvements upon it; and after due examination he became a champion of the new method. Juvenile classes were now established and taught gratuitously by Mr. Mason, who was soon compelled by the extent of his labors to associate Mr. G. J. Webb with him. Under his influence vocal music received a new and extraordinary impulse in Boston, and indeed throughout New England; eminent teachers introduced it into their schools; the Boston academy of music was established; music was prescribed as a regular branch of instruction in the public schools of Boston, and subsequently very generally throughout New England and the middle states; permanent musical classes, lectures on music, concerts, schools for instrumental music, and "teachers' institutes" for the training of music teachers and leaders of choirs, were very generally established. In 1837 Mr. Mason visited Europe, and made himself acquainted with all the improvements in musical teaching in the continental cities. Since his return, in addition to his large contributions to musical literature and the preparation of numerous text books for juvenile classes, glee books, and collections of church music, he has taught and lectured at the teachers' institutes in Massachusetts, and has instructed classes of music teachers almost every autumn. In 1835 he received from the New York university the degree of doctor in music, the first instance of the conferring of such a degree by an American college. Of late years he has devoted much attention to congregational singing in churches. Dr. Mason has been the author and compiler of more musical works than any other writer in America. For many years he has been a frequent contributor to the "Musical Review" and other periodicals; he has published 15 or 16 juvenile collections of music, 7 or 8 glee books, mostly in connection with Mr. G. J. Webb, and 20 sacred and church music books, assisted in 8 of them by Mr. Webb. Beside these, he has also published several smaller works, and a large number of single pieces. In all these books are many pieces of his own composition, and many more adapted by him from the compositions of other authors.

MASON, WILLIAM, an English poet and clergyman, born in Hull in 1725, died in York in April, 1797. He was the son of a clergyman, was educated at the university of Cambridge, and became a fellow in 1747. His first

cial works are a descriptive poem called "The English Garden," and two tragedies, "Elfrida" and "Caractacus." He was also the author of "An Historical and Critical Essay on English Church Music." He was an intimate friend and imitator of Gray, and published an edition of his poems with a memoir of his life.

MASON AND DIXON'S LINE, the parallel of lat. $39^{\circ} 43' 26.8''$ N., which separates Pennsylvania from Maryland, drawn by Charles Mason and Jeremiah Dixon, two distinguished English mathematicians and astronomers. It forms the dividing line between the free and slave states of the original confederation. This celebrated line properly begins at the N. E. corner of Maryland, and runs due W. The years from 1681 to 1768 were marked with constant dissension and conflict between the rival proprietaries of Pennsylvania and Maryland and their partisans, upon the subject of their common boundary; and the vicinity of this line was the theatre of riot, invasion, and bloodshed. The first English colonies were settled under a grant from King James I. in 1606, which gave to 2 incorporated companies 11° of latitude on the Atlantic, reaching from lat. 34° to 45° N., the whole territory having the common name of Virginia. The North Virginia or Plymouth company possessed the N.; the S. portion of the territory was held by the London company. Lat. 40° N. separated these two colonies. The northern was called New England by Capt. John Smith in 1614, while the southern retained exclusively the name of Virginia. In 1624 the influence of Gondemar, the Spanish minister, together with his own dislike of popular freedom, induced King James to revoke the charter of both. The unsettled wastes of their territories were now subject anew to the royal grant. In 1629 George Calvert, Lord Baltimore, besought the king for a charter of lands in this region, but died before it was perfected. His son and successor, Cecilius Calvert, subsequently obtained from Charles I. (June 20, 1632) a grant which he named Maryland, after the queen Henrietta Maria. It conveyed to him "all that part of the peninsula or chersonese lying in the parts of America, between the ocean on the east and the bay of Chesapeake on the west, divided from the residue thereof by a right line drawn from the promontory or headland called Watkins point, situated upon the bay aforesaid, and near the river of Wighco on the west, unto the ocean on the east; and between that boundary on the south, and that part of the bay of Delaware on the north which lieth under the 40th degree of latitude, where New England terminates. And all that tract of land from the aforesaid bay of Delaware in a right line, by the degree aforesaid, to the true meridian of the first fountain of the Potomac, and from thence tending down toward the south to the further bank of said river, and following the W. and S. side of it, &c., to the beginning." Under this grant, Lord Baltimore claimed the whole peninsula from the above

mentioned "right line" as the S. boundary, N. to lat. 40° . But in the preamble to his grant he was restricted to lands *hactenus inculta*, "hitherto unsettled," and the Dutch had previously settled on the W. shore of the Delaware; they therefore resisted his claim to the whole peninsula. In 1664 Charles II. granted the Dutch possessions to his brother James, the duke of York, who, after conquering them, assumed the place of the Dutch in resisting Lord Baltimore. It is proper here to remark, that the sole geographical knowledge of these regions at that time was obtained from a map made by the celebrated Capt. John Smith. On this map the line of 40° was incorrectly placed as far S. as the vicinity of the parallel which is now the N. boundary of Maryland. In 1681 Charles II. granted to William Penn the territory of Pennsylvania, as follows: "All that tract, or part of land, in America, with the islands therein contained, as the same is bounded on the east by Delaware river, from 12 miles northward of New Castle town, unto the three and fortieth degree of N. latitude, if said river doth extend so far northward, but if not, then by a meridian line from the head of said river to said 43d degree. The said land to extend westward 5 degrees in longitude, to be computed from said eastern bounds. And the said lands to be bounded on the north by the beginning of the three and fortieth degree of northern latitude, and on the south by a circle drawn at 12 miles distance from New Castle, northward and westward unto the beginning of the fortieth degree of northern latitude, and then by a straight line westward to the limits of longitude above mentioned." In 1682 Penn despatched a colony to his territory, and soon afterward it was discovered, by an astronomical observation, that the true parallel of 40° was so far north as to exclude him from any portion of the coast and from any territory on Delaware bay. Wishing to command an outlet to the ocean, he therefore, in Aug. 1682, purchased the duke of York's right to the land 12 m. around New Castle, and to all the W. coast of Delaware bay, below that, to Henlopen. Upon Penn's arrival in America with additional colonists in the autumn of 1682, he addressed himself to arranging the boundaries with Lord Baltimore; but not being able to make terms with him, the matter was referred to the king. At this juncture Charles II. died, and the duke of York ascended the throne as James II. He decided in favor of Penn's rights on Delaware bay, and ordered that part of the peninsula which is between the latitude of Cape Henlopen and 40° to be divided by a right line into two equal parts, that the E. half should belong to Penn, and the W. to Lord Baltimore. On May 10, 1782, the heirs of Penn and Calvert entered into an agreement for the final adjustment of their disputed boundaries. A semicircle was to be drawn at 12 m. around New Castle, N. and W. An E. and W. line was to be drawn, beginning at Cape Henlopen, and running W. to the "middle point" of the penin-

sula. From that middle point a line was to be run northward, so as to form a tangent with the circle around New Castle. From the tangent point a line was to be continued due N. until it reached a point whose latitude would be the same as that of 15 m. S. of the southernmost part of Philadelphia. From this point a due W. line should be run to the utmost longitude of Pennsylvania. In 1782, and again in 1789, commissioners were appointed to run these lines, but they had not proceeded far before new questions arose, and an appeal was made to the court of chancery in England. After a decision upon the question submitted, new commissioners were appointed in 1750, and again disagreed, and again an appeal was made to chancery. After some further delay an agreement was come to in 1760, and in November of that year commissioners to run the lines met in New Castle. Their surveyors (of whom the chief were John Lukens and Archibald McClean and his 6 brothers) then commenced their duties. Their progress through the dense forests was slow. During the three subsequent years they had completed their line across the peninsula, as well as the long tangent line; they had measured the radius from New Castle, and established the "tangent point." The proprietors, residing in London, and ignorant of the time and labor necessary in these surveys, grew impatient, and now employed Charles Mason and Jeremiah Dixon to complete them. These mathematicians arrived in Philadelphia, Nov. 15, 1768, and in December commenced their work, in connection with the McCleans, of the old surveyors. They first proceeded to determine the latitude of the southernmost point of the city of Philadelphia. It is recorded in their journal that in Nov. 1768, they employed a carpenter to construct an observatory in the S. part of Philadelphia. This was the first observatory in America. On Jan. 6, 1764, they determined its latitude. They then carefully examined the various lines run by the old surveyors, their predecessors, which they adopted as correct. In the autumn of 1764 they ran their parallel of latitude W. to the Susquehanna, thus commencing the famous line which bears their name. In 1764-'5 they ran the line due N. from the tangent point to the N. E. corner of Maryland, and in 1765 described such portion of the semi-circle around New Castle as enabled them to fix the point which is now the point of intersection of the three states. Then beginning where they had left off at the Susquehanna, they continued their line due W. On Oct. 27 they had reached the North mountain. On June 4, 1766, they were at the summit of the Little Alleghany. The Indians now became troublesome, but a negotiation was had with them by Sir William Johnson, and in May, 1767, a delegation of Indians was sent to the surveyors, with permission from the Six Nations to continue their surveys, and as an escort to protect them against the roving savages of the south. On June 8 they recommenced their line at the Little Alleghany.

On the 14th they had advanced as far as the Great Alleghany, where they were joined by their escort of 14 Indian warriors and an interpreter, headed by the celebrated Mohawk chief Hendrick. Mason and Dixon now continued their advance with a motley host of red and white men, comprising, in addition to the Indians, surveyors, chain bearers, rod men, axemen, commissaries, cooks, and baggage carriers, with numerous laborers, servants, and camp followers. Among these, beside the 7 brothers McClean, who afterward became prominent in the revolution, were Hugh Crawford, an old Indian trader, who for his services obtained a grant of valuable land, Paul Larsh of George's creek, and John Tate of Redstone. At a point 244 m. from the Delaware, and within 86 m. of the whole distance to be run, they came to an Indian war path, where the line crosses the Warrior branch of the old Catawba war path, at the second crossing of Dunkard creek. Here their Indian escort told them that it was the will of the Six Nations that the surveys should be stayed. There was no alternative, and retracing their steps, they returned to Philadelphia, and, reporting to the commissioners, received an honorable discharge on Dec. 26, 1767. At the end of every 5th mile a stone was planted, graven with the arms of the Penn family on one side, and of Lord Baltimore on the other. The intermediate miles were marked with smaller stones having an M on one side and a P on the other. The stones were all sent from England. The establishment of this line terminated the border war, which for nearly 90 years had kept the respective adherents of Baltimore and Penn in a state of constant hostility, although for half a century more frequent litigations were the result of the contest. Mason and Dixon returned to England, and were subsequently elected members of the royal society, under whose directions they observed the transit of Venus across the sun at the Cape of Good Hope in 1768. Dixon died in Durham, England, in 1777, Mason near Philadelphia in 1787. In Nov. 1782, Col. Alexander McClean of Pennsylvania, and Joseph Neville of Virginia, ran the remaining part of the line from the war path crossing of Dunkard creek to the S. W. corner of Pennsylvania, thus completing William Penn's limit of "5 degrees of longitude" from the Delaware. This remaining part was tested and corrected by astronomical observations, and permanently marked, in 1784.—The stone at the N. E. corner of Maryland having been removed, and a desire being manifested to have the former surveys revised, in 1849 commissioners were appointed by the states of Delaware, Maryland, and Pennsylvania, who called to their aid Lieut. Col. James D. Graham, of the U. S. topographical engineers. Col. Graham corroborated in all important points the work of the old surveyors and of Mason and Dixon. He, however, detected some errors. The radius was found to be 2 feet 4 inches too short; the "tangent point" had been placed 157 feet too far to the N., and

the point of intersection of the 8 states 148 feet too far to the S. This affected merely the arc of the circle reaching into Maryland, and resulted in flattening the arc, and making the state of Maryland one acre and $\frac{17}{100}$ larger than Mason and Dixon left the province of the same name. The other lines were found to be correct.

MASORA. See BIBLE, vol. iii. p. 227.

MASOVIA, or **MAZOVIA**, during the earlier centuries of independent Poland, a duchy or principality on both sides of the middle Vistula, inhabited by the Mazurs, a Polish tribe. In the Russian kingdom of Poland, it formed a government with Warsaw as its capital, now officially called the government of Warsaw.

MASQUE, a species of dramatic entertainment, comprehending scenic effects and dancing, much cultivated in Europe during the 16th and 17th centuries, and which reached its highest point of perfection in England in the reign of James I. Originating in the pageants, shows, and religious processions of the middle ages, the actors in which wore masks, and in the early miracle and moral plays, it gradually became a recognized form of the spoken drama, and the only one in which females, generally ladies of rank, took part. In the reign of James I. Ben Jonson and the leading dramatic authors, with the exception of Shakespeare, wrote masques for the court. Milton's "Comus" and "Arcades" are exquisite specimens. The genius of Inigo Jones was for a number of years employed exclusively upon the decorations and elaborate machinery of the court masques, and Henry Lawes furnished the music for several of them. The queens of James I. and Charles I., with the chief nobility of the court, participated in these entertainments, the preparation of which frequently occupied many months, and cost immense sums. With the death of Ben Jonson, who may be regarded as the chief writer of masques, the taste for them died away.

MASQUERADE (It. *mascherata*), an entertainment or ball, generally of a public character, in which the company are masked and otherwise disguised by dominos or fancy costumes. This species of amusement became fashionable in Italy as early as 1512, and about the same time was introduced into England by Henry VIII. It is popular on the continent of Europe, particularly in the large cities, and in carnival time; but it has been prohibited by law in many of the United States. (See **CARNIVAL**.)

MASS (Lat. *missa*), the principal form of public worship in the Roman Catholic church. According to the definition of Roman Catholic theologians, it is the true sacrifice of the new law—an offering instituted by Christ, in which, by the consecration and consumption of his body and blood under the form of bread and wine, Christ himself is mystically slain and offered as a victim to God the Father in recognition of his sovereign dominion. The derivation of the word *missa* from the Hebrew *missah* (which according to some means offering), and sev-

eral other derivations which have been proposed, are now generally abandoned, and *missa* is taken as another form of the substantive *missio*, i. e., dismissal. When first introduced, the term denoted the dismissal of the catechumens and penitents, who were permitted to be present at the introductory, but not at the sacramental service, before the beginning of which they were called upon to leave. The two parts of the service were then distinguished as *missa catechumenorum* and *missa fidelium*. This distinction ceased in the 4th century. The oldest work in which we find the term *missa* is a letter of St. Ambrose, and very soon after his time it passed into general use. The Catholic church believes that by the words of consecration, pronounced by the priest over the bread and the wine, these elements are changed into the body and blood of Christ. The sacrifice of the mass is not considered different from the sacrifice offered by Christ on the cross, but a repetition of the sacrifice of the cross, Christ offering himself again through the hands of the priest. Through it the merits of Christ are believed to be made available to men. It is called a propitiatory sacrifice, as Christ is believed to be really present as a victim, asking pardon for sinners as he did on the cross. The Roman Catholic church therefore sometimes offers masses specially for the dead, whom she mentions indeed in every mass. As she believes that Christians who leave this world without having sufficiently expiated their sins are obliged to suffer a temporary penalty in the other, she prays God, through Jesus Christ, for the remission of this penalty. The mass is called a eucharistic sacrifice, because it is believed that by offering Christ the church expresses gratitude to God in the best possible manner; and an impetratory sacrifice, because she hopes that God, touched by this offering, will grant new mercies.—In a liturgical point of view, the mass is divided into five parts: 1, the preparation, or the prayers made before the offering, which was formerly called the mass of the catechumens; 2, the offering, which extends from the offertory to the sanctus; 3, the canon, in which is included the consecration; 4, the breaking of the host and the communion; 5, the thanksgiving or post-communion. According to this rite and the language in which the mass is celebrated, different names have been given to it, as Greek, Latin, Roman, Gregorian, Ambrosian, Gallican, Gothic, Mozarabic, &c. (See **LITURGY**.) The differences between these masses concern only the form; the substance and also the principal parts are the same in all. All the liturgies also agree in prescribing the breaking of the bread, in conformity with the words of the Scriptures, which say that Christ broke the bread.—The liturgy of the mass still indicates that in former times all the people who were present communed with the priests. This usage gradually ceased, and the priest communed alone. It is now recommended to every priest to say mass frequently, and if possible daily. The presence of

one who recites the responses is as a general rule required. In modern times it has been oftentimes proposed in the church to celebrate the mass more rarely, and only when a large attendance of the people is to be expected. But the council of Trent confirmed the practice of saying private masses, and recommended to say mass frequently.—The language used at the mass is throughout the western church the Latin; only those portions of the eastern churches which are united with the Catholic, as the United Greeks, Jacobites, Copts, Chaldeans, Melchites, Maronites, and also the Illyrian and some Africans, as the Ethiopians, retain the right of celebrating the mass in the old language of their people (the old Greek, Syriac, Coptic, &c.). The wishes, sometimes expressed by larger or smaller bodies of the Catholic church, to translate the liturgy of the mass into the modern languages, and to let the responses at the mass be recited or sung by the entire congregation, have never been favored by the highest ecclesiastical authorities, though in some cases it has been permitted as a privilege, as for instance to the duke Eugene of Wurtemberg, who in 1786 received from Pius VI. permission to introduce the German mass into his court chapel.—There are different kinds of masses. A high or solemn mass is celebrated with the assistance of a deacon and subdeacon, and is sung by choristers; but the principal mass on Sundays and festivals, in which part of the service is sung by the priest, is also called high mass, though there are neither deacons and subdeacons nor choristers present. A low mass is one of which no part is sung, and at which the priest has no assistant but his clerk. The ordinary duration of a low mass is about half an hour. Every member of the Catholic church is bound, under pain of mortal sin, by one of the "precepts of the church," unless prevented by sickness or other grave impediment, to attend mass every Sunday and on certain holidays called days of obligation. The mass of the presanctified (*missa præsanctificationum*) is the name given to the service celebrated in the Latin church on Good Friday, when there is no consecration, but only a consumption by the priest of bread consecrated the day before. This, however, is not a mass at all, the consecration being an essential part of the sacrifice. Services of this nature are more frequent in the Greek church. At all masses the priest wears vestments which indicate by their color the ecclesiastical season of the year or the stated festival which is celebrated. Thus red is used for the feasts of martyrs, white for those of virgins, purple for the penitential seasons of Lent, Advent, and vigils. At the masses for the dead black vestments are used, some parts of the office are omitted, and the people are dismissed without the benediction. Masses may be said for any special purpose (votive masses), as for the recovery of health, for the avoiding of danger, for obtaining a special favor, &c. In the middle ages some practices crept in which the

church condemned, as the celebration of the mass without the assistance of a clerk, the combination of several masses in one in order to get a greater payment, &c. The dry or nautical mass, which during the middle ages was sometimes celebrated on board of vessels, and at which there was no consecration, was afterward forbidden by many councils.—The liturgy of the mass which is used in the Roman Catholic church received mainly its present form as early as in the time of Gregory I. From Rome it gradually passed into use in a large portion of the church. In some countries, however, particular missals were retained, contrary to the wishes of the popes. The council of Trent, in one of its first sittings, commissioned several doctors to prepare a revised edition of the Roman missal for general introduction. As this commission was, however, at the close of the council, not yet executed, the council referred the matter to the pope, Pius V. The pope appointed a committee, which prepared a new missal, using the Gregorian as a basis. It was promulgated July 14, 1570; new revisions took place under Clement VIII. in 1604, and Urban VIII. in 1684. The "congregation of rites," instituted by Sixtus V. in 1587, watches over the purity of the ritual. The Greek church and the other eastern churches hold, in the main, the same views with regard to the mass as the Roman Catholic church. The difference is mostly limited to ceremonies.—All the Protestant denominations agree in rejecting the mass, and in general the idea of a sacrifice, though some churches, especially the Lutheran and the Episcopal, have retained portions of the liturgy.

MASSACHUSETTS, a S. co. of Ill., bordering on the Ohio; area, 240 sq. m.; pop. in 1855, 5,692. The surface is diversified and heavily timbered, and the soil fertile. It contains coal and lead. The productions in 1850 were 146,700 bushels of Indian corn, 4,179 of wheat, 12,607 of oats, and 2,904 lbs. of wool.

MASSACHUSETTS, one of the 13 original states of the American Union, and one of the New England states, situated between lat. 41° 15' and 42° 58' N., and long. 69° 56' and 73° 32' W.; extreme length E. and W., 160 m.; breadth varying from 47 to about 110 m.; estimated area, 7,800 sq. m., or 4,992,000 acres. It is bounded N. by Vermont and New Hampshire, E. by the Atlantic ocean, S. by the Atlantic, Rhode Island, and Connecticut, and W. by New York. It is divided into 14 counties, viz.: Barnstable, Berkshire, Bristol, Dukes, Essex, Franklin, Hampden, Hampshire, Middlesex, Nantucket, Norfolk, Plymouth, Suffolk, and Worcester. The principal cities and towns are the capital, Boston, the largest and most commercial city in New England, on Massachusetts bay; Charlestown, Roxbury, and Cambridge, in the vicinity; Salem, New Bedford, Newburyport, Nantucket, Gloucester, Marblehead, Plymouth, Dorchester, Provincetown, and Sandwich, important depots of fisheries and commerce; Lowell, Worcester, Lynn, Springfield,

Fall River, Taunton, Lawrence, Chicopee, Danvers, Andover (the seat of several literary institutions), and Haverhill, interior and manufacturing towns.—The population at each national decennial census has been as follows: 1790, 878,717; 1800, 428,245; 1810, 472,040; 1820, 528,287; 1830, 610,408; 1840, 737,699; 1850, 994,514; and at the state census of 1855, 1,132,369, showing Massachusetts to be the 6th in point of population of the states of the Union. Increase of population from 1790 to 1850, 162.59 per cent.; 1840 to 1850, 34.80; 1850 to 1855, 16.30. Of the population in 1855, there were 550,084 males and 582,385 females; 1,122,468 were white (545,417 males and 577,046 females), and 9,906 colored (4,627 males and 5,279 females). Ages: under 5 years, 132,944; 5 and under 10, 115,862; 10 and under 15, 110,098; 15 and under 20, 117,047; 20 and under 30, 235,678; 30 and under 40, 165,046; 40 and under 50, 111,500; 50 and under 60, 71,829; 60 and under 70, 42,428; 70 and under 80, 20,810; 80 and under 90, 6,188; 90 and under 100, 634; 100 and over, 19; unknown, 2,341. Natives of the United States, 886,575; of foreign countries, 245,263; unknown, 531. During the year 1858 there were 84,491 births (17,453 males, 16,840 females, and 198 not stated); deaths in the same period, 20,776 (10,846 males, 10,354 females, and 76 unknown); marriages, 10,527. The occupations of 388,532 male persons over 15 years of age were returned by the census of 1855 as follows: agriculturists, 57,031; factory operatives, 8,801; laborers, 60,248; mariners and boatmen, 16,346; manufacturers, 5,294; mechanics, 122,251; merchants, 29,039; professions, 8,312; miscellaneous, 26,220. There were 401 deaf and dumb, 471 blind, 1,919 insane, 838 idiotic, 5,687 paupers, and 2,901 convicts. Families, 228,845; dwellings, 175,311. Density of population, 145.17 to the square mile, being greater than that of any other of the United States.—From the W. for about 100 m. Massachusetts has the regular form of a parallelogram about 50 m. in width; thence it spreads out to the N. E. and S. E. on two sides of Massachusetts bay, terminating on the S. E. in the long peninsula of Cape Cod, which, describing to the N. and slightly to the W. a segment of a circle, encloses Cape Cod bay. It also includes several islands, of which Martha's Vineyard and Nantucket are the largest. Beside the two mentioned, there are Buzzard's bay on the S. coast, 30 m. long, with an average width of 7 m., and Plymouth bay, a small inlet communicating with Cape Cod bay on the W. The state has many excellent harbors. No large and navigable rivers, if we except the Merrimack, find their outlet on the coast. The Housatonic river, which rises in the W. part of the state, and the Connecticut, flow S. through Connecticut into Long Island sound; the Merrimack flows through the N. E. corner, and supplies immense water power to Lowell, Lawrence, and other manufacturing towns. The other principal streams are the Nashua, Taunton, Concord,

Blackstone, and Charles. It contains a number of small lakes, but none of considerable size.—The surface of Massachusetts is greatly diversified. The extreme W. is mountainous, having two ranges of the Green mountains, the Taghkanic or Taconic and Hoosic ridges. Saddle mountain in the N. W. corner is 3,505 feet high, and Mt. Washington in the S. W. corner 2,624 feet high. Further E. is the beautiful and fertile valley of the Connecticut. In this section are several elevations, detached members of the White mountain system, the highest peaks of which are Mt. Tom (1,200 feet) on the W., and Mt. Holyoke (910 feet) near Northampton, on the E. bank of the Connecticut river; and Wachusett mountain (2,018 feet) to the N. of the middle of the state. The E. and N. E. are hilly and broken, and the S. E. generally low and sandy.—Massachusetts is eminently a region of metamorphic rocks. Those in the E. part of the state especially are largely overspread with the sands, gravel, and boulders of the drift formation; and the long point of land making the S. E. extremity of the state (see CAPE COD) is so covered with these loose materials, that the rocky beds beneath are entirely concealed. Sienite and granite prevail along the coast, and extensive quarries of these rocks are worked at Quincy, Cape Ann, and other points. Around Boston is a formation of coarse conglomerates and argillaceous slates of obscure age on account of the metamorphic action to which they have been subjected. At Braintree, near Quincy, the slates have been found to contain trilobites, but generally no fossils have been met with in these rocks. The fossils would seem to refer the slates to the lower silurian period. These obscure formations are traced in an irregular belt toward Providence, and near the Rhode Island line they are connected with coal-bearing strata, referable, it is supposed, to the true carboniferous epoch. In many localities in Bristol and Plymouth counties these strata contain beds of anthracite, some of which, as at Mansfield, have been worked for many years. They prove, however, of little or no value, the coal always being much crushed, and the beds very irregular in their production. Gneiss and talcose and mica slates in broad belts traverse the state from N. to S. from the E. portion to the waters of the Housatonic in Berkshire. Among these rocks are interspersed a few beds of metamorphic limestone, but no minerals or ores of value. Along the Connecticut river valley the "middle secondary red sandstone" is met with in one or several belts, the northern termination of this group of rocks, which is thence traced southward as far as Virginia. Trap rocks are associated with it, and near the contact of the sandstone and trap, or of the sandstone and the gneiss, are found veins of metallic ores, as of lead, copper, and zinc, none of which, however, have repaid the money spent in their exploration. The principal localities of these ores are at Southampton, Leverett, Montague, Whately, and a few other towns. The high lands which

traverse the state from N. to S., dividing the waters that flow into the Connecticut from those of the Housatonic, and called the Hoosic mountains, are chiefly of gneiss and mica slate. In Middlefield a belt of talcose slate, contained further N. in the mica slate region, reaches the gneiss; and here are developed in near proximity beds of limestone, steatite, and serpentine. The towns along the Housatonic and on the same range extending to the N. border of the state are in the region of the altered silurian sandstones and calcareous formations. This is the most important mineral district of the state, numerous beds of iron ore having been worked for many years, and the quartz rocks affording in their disintegrated beds bodies of glass sand of unusual purity. For further reference to these products, see GLASS, HEMATITE, and IRON. —Massachusetts is naturally the least fruitful of the New England states, but careful and laborious cultivation has much improved large tracts of land which would otherwise have remained sterile. In the valleys, particularly of the Housatonic and Connecticut, the soil is rich and productive, but a large portion of the more elevated lands and the long sandy coast do not repay the husbandman. The climate near the coast is very variable, with prevailing E. winds, especially in the spring. In the interior it is more equable, and in the mountainous districts very severe in winter. The mean temperature is between 44° and 51°. Of the total area of the state, somewhat less than one half is improved. The agricultural products in 1855 were 41,000 bushels of wheat, 2,595,096 of Indian corn, 523,776 of rye, 792,828 of oats, 8,984,818 of potatoes, 241,000 of onions, 523,677 of turnips, 631,960 of carrots, 648,610 tons of hay, 8,116,009 lbs. of butter, 5,762,776 of cheese, 78,677 of honey, and 416,156 of wool. There were 2,236,900 apple trees cultivated for their fruit, yielding to the value of \$1,121,261; 185,892 pear trees, yielding \$88,144; value of other fruit, \$105,835. Total value of agriculture products, \$21,556,162. The live stock in 1855 consisted of 80,321 horses, 148,569 milch cows, 77,511 oxen, 62,727 steers and heifers, 145,215 sheep, and 51,118 swine; value, \$16,814,900. —In manufacturing industry Massachusetts stands at the head of all the states, and will compare favorably with any other portion of the world; while the condition of her operatives, their moral and intellectual character, and the happy relations existing between them and their employers, has no parallel in other manufacturing districts. In 1855 there were in the state 294 cotton mills, with 1,519,527 spindles, consuming 105,851,749 lbs. of cotton, and manufacturing 814,996,567 yards of cloth, value \$24,859,212; 3,821,646 lbs. of cotton yarn, \$830,546; 534,393 lbs. of cotton thread, \$285,934; 4,825,686 lbs. of batting, \$395,374; 370,000 of wadding, \$139,865; 3,227,620 yards of cotton flannel, \$120,056; and 15,000 lbs. of wicking, \$9,550. Capital invested in the manufacture of cotton, \$31,961,000; hands employed, males 11,937,

females 22,850. There were 6 calico manufactories, which printed 61,040,000 yards of calico, value \$5,143,000; bleached and colored but not printed, 1,000,000 yards, value \$70,000; capital invested, \$1,980,000; hands employed, 1,028 males and 184 females. Beside the foregoing, there were 11 establishments not connected with calico printing which bleached or colored 66,400,000 yards, value \$5,111,200; capital invested, \$659,000; hands employed, 644. Of woollen mills there were 146, with 695 sets of machinery, consuming 18,786,298 lbs. of wool, and manufacturing 769,627 yards of broadcloth, value \$837,650; 6,444,585 of cassimere, \$5,015,441; 6,736,082 of satinets, \$2,708,935; 1,948,609 of Kentucky jeans, \$31,000; 10,279,227 of flannel or blanketing, \$3,125,949; and 689,957 lbs. of woollen yarn, \$386,537; capital invested, \$7,305,500; hands employed, 5,946 males and 4,144 females. There were 275,000 lbs. of wool consumed in the manufacture of satinets at Stockbridge, which with a few smaller items are not included in the above. There were 18 carpet mills, consuming 53,000 lbs. of cotton and 2,880,974 of wool, and manufacturing 1,988,460 yards of carpeting, value \$1,362,819; capital invested, \$2,264,172; hands employed, 780 males and 834 females. Beside these there were 4 mills for the manufacture of painted carpeting, capital \$12,500, producing 88,000 yards; 20 hosiery manufactories, capital \$169,980, employing 116 males and 140 females, and producing to the value of \$207,160; 4 linen manufactories, capital \$550,000, employing 465 males and 445 females, and producing 2,600,000 yards, value \$1,240,000, and 1,150,000 lbs. of thread, value \$200,000; 5 silk factories, capital \$55,000, employing 35 males and 103 females, and producing 44,000 lbs. of sewing silk, value \$300,000; 49 rolling, slitting, and nail mills, with 788 nail machines, capital \$2,342,825, employing 3,025 hands, and producing 34,557 tons of nails, value \$2,786,966, and 35,934 tons of other manufactured iron, value \$2,725,850; 15 machines for making horse nails, capital \$60,000, and one establishment for the manufacture of zinc nails and brads, capital \$10,000; 206 forges, capital \$739,600, employing 547 hands, and manufacturing 6,746 tons of bar iron, anchors, chain cables, &c., value \$915,980; 44 steam engine and boiler establishments, capital \$2,099,500, employing 2,638 hands, and manufacturing to the value of \$3,225,000; 109 establishments for the manufacture of machinery, capital \$2,404,000, employing 3,740 hands, and producing to the value of \$4,089,590. There were 82 flour mills producing 263,100 barrels, value \$2,040,040; 266 tanneries, producing 2,104,172 tanned hides, value \$4,785,369; and 250 currying establishments, value of leather curried \$1,698,438, patent and enamelled leather \$1,271,942. There were 11,892,329 pairs of boots and 33,174,499 of shoes manufactured, value \$37,501,723; straw bonnets 3,326,080, and straw hats 1,907,485; bricks 108,353,000, value \$2,627,165. The value of other

manufactures for 1855 was: fire engines, \$50,000; scythes, \$120,582; axes, hatchets, and edge tools, \$626,654; cutlery, \$573,625; screws, \$180,000; butts and hinges, \$22,000; tacks and brads, \$621,212; shovels, spades, forks, and hoes, \$894,515; ploughs, \$707,175; other agricultural implements, \$56,805; iron railings, fences, and safes, \$656,400; window glass, \$48,125; other glass, \$2,600,000; starch, \$195,000; chemical preparations, \$1,095,600; paper, stock used 683,153 tons, quantity made 17,959 tons or 711,953 reams, value \$4,141,847; pianofortes and other musical instruments, \$2,656,830; hats (not including straw hats) and caps, \$350,378; cordage, \$636,400; oil and sperm candles, \$6,813,290; tallow candles, \$366,167; soap, \$7,354,366; powder, \$228,125; firearms, \$391,475; cannon, \$54,151; chairs and cabinet ware, \$3,969,982; combs, \$557,422; white lead, \$629,850; other paints, \$280,340; linseed oil, \$890,000; building stone quarried, \$1,585,218; marble, \$561,650; wooden ware, \$745,711; whips, \$505,500; corn and other brooms, \$323,185; lasts, \$179,450; shoe pegs, \$12,900; lumber prepared for market, \$3,664,462; firewood, \$2,960,915. Some of the above statistics are deficient, owing to incomplete returns. According to the official returns, which, however, are not entirely full, the number of vessels engaged in the whale fisheries in 1855 was 492, tonnage 154,061; capital invested, \$14,546,548; hands employed, 11,864; sperm oil received, 2,068,809 galls., value \$3,059,018; whale oil, 6,645,684 galls., value \$3,905,605; whalebone, 2,037,300 lbs., value \$802,373. Vessels employed in the mackerel and cod fisheries, 1,145, tonnage 77,936; capital invested, \$3,696,436; hands employed, 10,551; mackerel taken, 153,464 lbs., value \$1,355,332; codfish, 439,380 quintals, value \$1,413,418; cod liver oil, \$60,895; salt consumed, 424,549 lbs.; alewives, shad, and salmon, 52,278 bbls., value \$73,156. Vessels launched 156, tonnage 92,869. Total industrial production in 1855, \$295,820,681.—The exports from Massachusetts for the year ending June 30, 1859, were valued at \$18,158,618, of which \$16,036,603 was domestic and \$2,122,215 foreign; imports, \$43,184,500. Clearances 2,755, tonnage 758,885; entrances 4,020, tonnage 882,493. The total tonnage on June 30, 1859, was 829,034, of which 154,048 was employed in the whale fishery, 71,596 in the mackerel and cod fishery, and 20,680 was steam.—On Jan. 1, 1860, there were 176 banks of issue, whose liabilities were as follows: capital, \$64,519,300; circulation, \$18,031,121; deposits, \$26,204,513; profits on hand, \$6,942,147. Resources: notes, bills of exchange, &c., \$107,609,870; specie, \$6,278,498; real estate, \$1,602,613; total, \$115,696,981. On Nov. 1, 1859, there were 86 savings banks, with deposits to the amount of \$39,424,418 from 205,409 depositors. From 1851 to 1859, 176 joint stock companies were incorporated, with an aggregate capital stock of \$11,349,200; cash paid in, \$7,553,982.—The following table exhibits the extent

At the same date there were 15 horse railroad companies; cost of roads and equipments \$2,266,442.76, aggregate length 88.21 m.; net income, \$133,241.11. The capital stock of the above roads was \$61,478,500; paid in capital, \$50,194,057; debt, \$17,958,375; total income, \$10,871,830; working expenses, \$6,330,282; interest paid, \$819,297; net income, \$3,674,653; amount of dividends, \$2,468,583.—On Nov. 1, 1859, there were 86 stock insurance companies, with a paid in capital of \$6,736,100; fire risks outstanding, \$126,151,695; marine risks, \$45,545,105; premium in cash on fire risks \$1,343,920, on marine risks \$1,187,844; in notes on fire risks \$4,194, on marine risks \$2,023,723; fire losses paid the last year, \$804,761; marine losses, \$2,208,780; dividends, \$1,222,042. Of mutual marine and mutual fire and marine insurance companies there were 14, having \$1,089,586 invested in various stocks and

cash, and \$4,948,722 in notes and other securities; they paid in the year \$60,866 for fire losses and \$1,701,406 for marine losses. The number of mutual fire insurance companies was 67, which had insured on existing policies \$213,887,545; received for premiums and deposits in cash \$2,861,915, and paid for losses \$859,988. There were 5 life insurance companies, having an amount insured of \$22,043,804; amount of assets, \$2,984,878; received for premiums, in cash \$408,702, notes or securities \$158,899. All the insurance companies are under the supervision of 2 state commissioners.—According to the census of 1850 there were 1,475 churches, of which 266 were Baptist, 80 Christian, 448 Congregational, 54 Episcopalian, 30 Friends', 7 free, 262 Methodist, 15 Presbyterian, 41 Roman Catholic, 168 Unitarian, and 123 Universalist, the remainder belonging to a variety of sects. The number of public schools in 1859 was 4,444, with 204,925 pupils in summer and 211,388 in winter; average attendance in summer 160,108, in winter 166,520; male teachers 2,023, female 8,180; average length of school during the year, 7 months and 17 days; average wages of male teachers per month, including the value of board, \$48.90; of female teachers, \$19.02; amount of money raised by taxes for the support of schools, \$1,890,882; voluntarily contributed, \$29,809. The school fund is \$770,756, from which is derived an annual income of \$41,048. The number of incorporated academies in 1859 was 68, with an average of 3,932 pupils; aggregate paid for tuition, \$74,228. There were 691 unincorporated academies, with an average of 18,908 pupils; aggregate paid for tuition, \$383,940. The ratio of attendance (163,814) of children between 5 and 15 to the whole number in the state (220,879) is 74 per cent. Four normal schools are supported by the state, of which those at Framingham and Salem are intended to prepare young women for the career of teachers. At the former, in 1859, 57 had been admitted, 84 graduated, and 15 dismissed; whole number belonging to the school, 70. At Salem, 86 were admitted in 1859, and 41 graduated; whole number of pupils, 139. The institutions at Westfield and Bridgewater are intended for both sexes, and had an attendance in 1859 respectively of 186 and 99. The state contains 5 colleges, viz.: Harvard at Cambridge, Williams at Williamstown, Amherst at Amherst, Holy Cross at Worcester, and Tufts at Medford, with an aggregate of 995 students.—Massachusetts contains a large number of charitable institutions, all of which are highly reputed for their enlightened and efficient management. The Perkins institution and Massachusetts asylum for the blind had on Sept. 30, 1859, 123 blind persons connected with it, viz.: 3 teachers, 3 assistants, 88 pupils, and 29 workmen. At Worcester, Taunton, and Northampton are state lunatic hospitals, having at the same date an aggregate of 891 patients, 415 males and 476 females. During the year ending Sept. 30, 1859,

81,400 paupers were relieved or supported by the cities and towns, of whom 10,869 were in 222 almshouses, at a net expense of \$522,812. For the same period 1,392 indigent children under 14 years of age were supported at the public charge. There are 3 state almshouses, at Bridgewater, Monson, and Tewksbury, containing an aggregate of 1,624 inmates. The Rainsford island hospital, Boston harbor, had 159 patients; the cases are mainly from immigrant vessels. The state reform school at Westborough, for juvenile offenders, contained 505 boys; and the state industrial school for girls at Lancaster had 99 girls. The Massachusetts school for idiotic and feeble-minded youth had 67 pupils, of whom 45 were supported by the state, 4 partly by other states, 4 partly and 14 wholly by friends. The state prison contained at the above date 491 convicts; expenditures during the year, \$87,821; receipts \$78,647, of which \$65,889 was for the labor of convicts. On Oct. 1, 1858, there were 508 prisoners in the gaols, and 1,490 in houses of correction; average, 1,799; committed during the year, 12,466, viz.: to gaol 8,286, to houses of correction 5,180; expenses, \$216,252; value of labor, \$59,902.—The executive department of the government consists of a governor elected for 1 year, salary \$3,500; lieutenant-governor, \$600, with extra pay and mileage for attendance at other than regular sessions of the council; secretary, treasurer and receiver-general, and auditor, each \$2,000; attorney-general, \$2,500; heads of bureaus, and an executive council composed of 8 members, elected annually from the same number of divisions of the state, who receive \$300 each for the regular annual session of their board, \$3 per day for any subsequent session, and 20 cents a mile for travel. The legislative department consists of a senate and house of representatives, annually elected; in the former there are 40 members, in the latter 240. Their pay is \$300 for the regular annual session, and 20 cents a mile for travel; a deduction of \$3 per day is made for non-attendance unless excused by the house of which the delinquent is a member. The president of the senate and the speaker of the house of representatives receive each \$600 for the session. The judiciary comprises a supreme judicial court, consisting of a chief justice, salary \$4,500, and 5 justices, \$4,000 each. This has exclusive cognizance of all capital crimes, exclusive chancery jurisdiction so far as chancery powers are given by statute, and concurrent original jurisdiction of all civil cases where the amount in dispute exceeds \$4,000 in Suffolk, and \$1,000 in other counties. The superior court is held for the trial of all civil cases above \$200, and has criminal jurisdiction in all except capital cases; it has a chief justice, salary \$3,700, and 8 justices \$3,500 each. The legislature in 1858 united the courts of probate and the court of insolvency. For probate and insolvency purposes, frequent courts are held at different places by the judge in the various counties. A register of probate and insolvency is

elected by the voters of each county for a term of 5 years, and there are 5 assistant registers. There are 14 judges and the same number of registers, with salaries varying from \$800 to \$3,000. The resources of the state on Jan. 1, 1860, were as follows: unproductive real estate, \$3,116,179.56; railroad bonds and mortgages for scrip loaned, \$5,049,188.56; railroad stock, Massachusetts school and other funds, \$5,854,005.44; total, \$13,519,368.56. The liabilities were: scrip issued on account of reform school, state prison, hospitals, state house, almshouses, and loan of 1856, \$1,314,000; scrip loaned railroad companies, payable by them, \$5,049,183; temporary loan for money borrowed in anticipation of sale of scrip, and of revenue, &c., \$324,647; amounts due from state treasury and uncalled for, \$55,597.88; grants to sundry institutions from the avails of sales of Back bay lands, \$200,000; total, \$6,948,428.44; surplus, \$6,575,940.12. Total receipts for 1859, \$3,016,697.88; total payments, \$3,078,206.86; excess of payments, \$56,508.48.—The continent of North America is claimed and generally conceded to have been discovered by Norwegian navigators in 986, when Biörn on a voyage from Iceland to Greenland, having lost his reckoning, went so far beyond his destination as to come in sight of the mainland on the W. In 1000 Leif, stimulated by the report of Biörn, sailed in search of the new land, found it, went on shore, reëmbarked, and sailing southward, wintered at a place by him called Vinland or Wineland, from the abundance of its grapes. Thorwald, a brother of Leif, sailed for Vinland on the return of the latter, and discovered several islands. The expedition remained there about 3 years. Thorwald, having been killed by a native, was succeeded at intervals by other adventurers and explorers. This discovery led to various unsuccessful attempts at colonization, continued during a period of more than 300 years. Vinland has been thought to be that part of the continent occupied by the S. E. portion of Massachusetts and Rhode Island. In 1497 John Cabot, sailing on a general voyage of discovery under a patent granted by Henry VII., skirted the E. coast of North America, and landed, but without observing any inhabitants. His son Sebastian, who had accompanied him in the above expedition, while on a voyage to discover a N. W. passage to China and Japan, made several landings on the North American coast, in which he saw some of the natives, taking 3 with him to England. Gaspar Cortereal, the Portuguese navigator, also visited the coast in 1500-1, as far S. probably as Connecticut, and returned with 57 Indians, whom he sold as slaves. John Verrazzano, a Florentine, Stephen Gomez, in the service of Spain, and others afterward landed upon the coast; but no special attempt was made for many years by the English, who claimed it under the discovery of the Cabots, to avail themselves of the advantages thus acquired. Though the fisheries off Newfoundland had engaged some attention, and formal

possession had been taken of that island, that part of the continent now known as New England was neglected until 1602, when Bartholomew Gosnold with a colonizing expedition of 32 persons, sailing in a direct course across the Atlantic, made the land in Massachusetts bay, at a point supposed from description to be Salem harbor. Standing to the southward, he passed and named Cape Ood from the fish there taken, and keeping on further discovered and named a small island Martha's Vineyard, now called No Man's Land, the former name being subsequently transferred to the large island to the N. He afterward selected a little island now known as Cuttyhunk, and forming the southernmost of the group of Elizabeth islands, but which he called Elizabeth island, for settlement. Here a portion of the company built a house fortified with palisades and thatched with sedge, and a stone cellar, while the others went into the interior on a trading expedition to the Indians. The settlement was however abandoned within a few weeks, dissensions among themselves, difficulties with the Indians, and scarcity of provisions having disheartened those who were to have remained. This was the first settlement made in Massachusetts by Englishmen, and these were the first Englishmen who stood upon its soil, more than a century after it had been discovered by John Cabot the Venetian. New interest in the discovered but yet unexplored region was aroused by the expedition of Gosnold, and in the following year two small vessels commanded by Martin Pring or Prynne set out on a venture, the main purpose of which was commercial, as they took commodities intended to be bartered with the savages for sassafras, then greatly esteemed for its medicinal properties. They rested in what is conjectured to be the present Edgartown in Martha's Vineyard; but the threatening manner of the Indians hastened their departure after a sojourn of only 2 months. In 1605 and 1606 French expeditions visited the coasts with the intention of securing possession of the country, but the hostility of the natives and the severity of the weather frustrated their purpose. A futile voyage of George Weymouth in 1605, resulting merely in the seizure of 5 savages, led indirectly to a more extensive and determined but unsuccessful attempt to colonize the country. A movement, mainly promoted by Sir John Popham, chief justice of the king's bench, and Sir Ferdinando Gorges, at that time governor of Plymouth, led to the formation of two companies, one of which, the Plymouth company, under the direction of "sundry knights, gentlemen, and other adventurers of the cities of Bristol and Exeter, and of the town of Plymouth and of other places," had assigned to them North Virginia, lying between the parallels of 38° and 45°. They were empowered to expel intruders, coin money, impose taxes and duties for their own use for 21 years, and for 7 years import goods free of duty from other parts of the British dominion. They were

held to pay into the royal treasury 20 per cent. of the product of gold and silver mines which might be discovered, and $\frac{1}{3}$ of that rate on copper. Both companies were to be under the control of a body of 18 called the council of Virginia, and appointed by the crown. The coasts of New England were surveyed by a vessel despatched for that special purpose, and which returned with encouraging accounts. A well provided expedition sent out by this company made a brief settlement in Maine, and then returned discouraged. Capt. John Smith, on a voyage made in 1614, drew a map of the country, which he called New England; and the principal points had names given them by the prince, afterward Charles I. Immediately on his return Smith was engaged by the Plymouth company, who fitted out a new expedition of two ships after much exertion, and intrusted the command to him. The smaller vessel, under Capt. Dermer, made the voyage, obtaining a freight, but accomplishing nothing more; but Smith, compelled to put back by the unseaworthiness of his vessel, failed, after various attempts and many adventures, to achieve his object. Several other voyages were made under the auspices of the company, chiefly for purposes of traffic, meeting however with no success. But soon motives more powerful and durable than the pursuit of gain led to the permanent colonization of these shores. Among the English who had sought religious liberty in Holland were a number from Nottinghamshire, who had escaped after many perils, and, not mingling with those who under similar circumstances had fixed their abode in Amsterdam, selected Leyden for a resting place. Of this community John Robinson was pastor and William Brewster an elder. But the strange people, the strange language, and the change from agriculture to trade or mechanical labor, rendering their residence irksome and unsatisfactory, they resolved to brave the dangers of the sea, the hostility of the savages, and the "famine, and nakedness, and the want, in a manner, of all things, with sore sickness," so that they might be free and untrammelled, and in some way again joined to the country they never ceased to love. Having determined, after considering various projects, to settle in America under the Virginia company, if they could obtain from the crown the privilege of religious freedom, two of their number, Robert Cushman and John Carver, were sent to negotiate with the company and to petition the king. With the former they made terms, but from James they could only obtain an implied assurance of non-interference. After annoying delays a patent was obtained from the Virginia company in the name of one who did not accompany the expedition, and for lands they did not occupy, and which was consequently of no value. The means necessary to defray the expenses of the voyage and the first settlement were to be furnished by a company who, in the arrangement for a participation in the profits, rated the labor of each

emigrant above 16 years of age as a capital of only £10. All profits were to be reserved for 7 years when the whole amount, and all houses and land, gardens and fields, were to be divided among the shareholders according to their respective interests. All the arrangements having been completed, the pilgrims embarked at Delft Haven, July 22, 1620, in the *Speedwell*, a little vessel of 60 tons burden, after a solemn and affecting leave-taking from their brethren, among whom was their pastor John Robinson, many being obliged to remain, as it was intended that at first none but the youngest and strongest should go. Arriving at Southampton, they found the *Mayflower*, of 180 tons, which had recently come from London, and the two vessels sailed together, Aug. 5, for the new world. The *Speedwell* proving leaky, both vessels put in at Dartmouth, and after a detention of 8 days again set sail. But the master of the smaller ship, after they had gone about 300 miles, insisted on relinquishing the voyage for the alleged reason of her unfitness, and they returned to Plymouth. Then, after permitting those who chose to abandon the enterprise, 102 souls set sail, Sept. 6, in the *Mayflower*. After a voyage of 68 days, the latter part of which was rough and stormy, and during which they lost one of their number, they made the land of Cape Cod, and on Nov. 11 were riding safely at anchor in the roadstead of the present Provincetown. Before landing they drew up and subscribed a solemn compact or constitution, by the terms of which they were to be ruled; and immediately after John Carver was elected governor for one year. An exploring party spent some days in searching for a favorable place to commence the settlement, and they at last landed at Plymouth, Dec. 22. The settlers at once began the building of works for defence, laid out 19 plots for dwellings, the number of the families into which they were divided, and agreed "that every man should build his own house." But the severity of the weather, exposure, and bad food brought on sickness, which took off nearly half their number in about 4 months; and so reduced in strength and numbers were the survivors that they were scarce able to attend the dying or bury the dead. Soon after landing they had communication with the Indians, and made a treaty of amity with Massasoit and his people, with whom they remained friends for a long period. With other chiefs and tribes they had occasional disputes and skirmishes, but they soon acquired an influence and control which relieved them from serious molestation. In these matters Capt. Miles Standish achieved great reputation. In the following spring the *Mayflower* departed, and shortly after the colony met with a grievous loss in the death of Gov. Carver. William Bradford was thereupon elected to the vacancy, with Isaac Allerton as his assistant. Until 1628, when they had a plentiful harvest, the colony endured many privations, and were often near starving. But in that year some changes were made in the

system of labor, and the plan of common property was abandoned. During this time the colony received accessions from abroad, and other settlements were attempted. The *Fortune*, which arrived about 11 months after the first settlement with a reinforcement of some 30 emigrants under Cushman, was sent back with a freight of beaver skins and clapboards to the value of £500, the first proceeds of the enterprise, to the company in England. A new patent was obtained in 1622 by Mr. Weston of London, formerly connected with the Plymouth colonists, under which he despatched an expedition to settle for him a plantation in Massachusetts bay. They were hospitably received and entertained at Plymouth, and commenced a plantation at Wessagusset, now Weymouth. They were unfitted for the undertaking, being careless, improvident, and regardless of the rights of others; they received many favors from the Plymouth colony, which were ill requited, and almost brought upon them an attack from several combined tribes of Indians who were incensed at their aggressions. Meanwhile the Plymouth colony began to thrive, but various causes of trouble with the company in London had grown up, from which they became anxious to obtain a release. The result of negotiations was that 7 or 8 of the principal men undertook on behalf of the colony the payment of £1,800 in 9 equal annual instalments. A new organization was then formed, a partnership entered into, the stock and land divided, and they became individually independent property holders. All efforts to obtain a patent from the crown were unavailing, and the Plymouth colonists were thus obliged to carry on their government without the royal sanction. They quietly assumed all the necessary powers and discharged all the functions of the state. A governor, with a council of 5, afterward 7, assistants, and a legislature consisting at first of the "whole body of the male inhabitants," made and administered the laws by which the state was ruled. In the mean time other influences were at work to extend the range of settlements. A number of gentlemen of Dorchester, England, having much interest in the fisheries and trade of New England, organized an association for the establishment of a settlement on Cape Ann, a scheme in the direction of which Mr. John White had much influence. This was unsuccessful; but another company was subsequently formed, which obtained a grant of territory lying between the Atlantic and the Pacific, and extending 8 m. S. of the river Charles and Massachusetts bay and 8 m. N. of every part of the river Merrimack. Under these auspices an expedition reached Salem in 1623, commanded by John Endicott. Upon the news of Endicott's safe arrival renewed interest was excited, new associates joined, and a royal patent was at last obtained for the company of the Massachusetts bay. The charter established a corporation, and the associates were constituted a body politic. Its officers were a governor

deputy, and 18 assistants, to be annually elected. A general assembly of the freemen, to be held 4 times a year or oftener if required, was intrusted with legislative powers. The question of religious liberty was avoided in the instrument, but the making of laws contrary to those of England was strictly forbidden. In 1629 a reinforcement was despatched of 800 men, 80 women, and 26 children, with victuals, arms, tools, cattle, and goats; and in the same year it was determined to transfer the government and patent of the company from London to New England. The old officers resigned, and new officers were appointed from among those who intended to emigrate, John Winthrop being made governor. A new emigration was thus promoted, and soon the colony received an accession of about 1,000 persons, who had been conveyed in 17 vessels. Their reception was discouraging; the settlers were sick and weak, their food and strength almost exhausted. Sites for settlements were promptly selected; and the names of Charlestown, Boston, Watertown, Dorchester, Roxbury, Salem, Mystic, Saugus (Lynn), and others, occur in the history of this period. This colony suffered great hardships. Many died, and others, disheartened, returned to England; yet those who remained preserved their fortitude amid all discouragements. In the organization of their government particular attention was paid to the observances and maintenance of their religion and the civil rights of the individual. Though at first somewhat aristocratic, the government soon received various liberal modifications, adopting, however, a religious test of citizenship. They established peaceful relations with the Indians; and, desiring to promote friendly sentiments with the other European settlements, Gov. Winthrop and Wilson, pastor of Boston, visited the old or Plymouth colony in Oct. 1632, were received by Bradford and Brewster, and kindly welcomed and entertained by the people. The Massachusetts company continued to receive additions from England, and in the exercise of their political and religious privileges manifested a jealous and vigilant interest. Issues were made between the magistrates and people on the construction of the charter in reference to legislation and representation, the mode of voting was changed from the show of hands to the ballot, and a law against arbitrary taxation was passed; while from 1634 to 1644 a dispute continued concerning the relative powers of the assistants and deputies. That the sacrifices made by the Puritans to obtain religious freedom for themselves involved no recognition of the general principle of religious toleration, may be justly inferred from their conduct toward those who deviated from their ecclesiastical standard, of whom Roger Williams is the most conspicuous example. The Massachusetts colony for 4 years after their settlement had been left to bear their burdens and work out their own way without the interference of England. But the increasing emigration from the latter country,

and a suspicion on the part of the crown that the colony desired to be independent, led to an attempt to annul the charter, and the appointment of a special commission for its government, at the head of which was Archbishop Laud. The colony received an order, which they evaded, to deliver up their charter, and at a meeting of the general court measures were taken for the fortification of Boston harbor, Charlestown, and Dorchester, and arrangements made for drilling and disciplining troops. As to the threat of sending out a general governor, it was decided that "we ought not to accept him, but defend our lawful possessions, if we were able, otherwise to avoid or protract." The political agitations of the mother country preserved the colony from the dangers which threatened her from that quarter. A disturbance with the Pequots, in which Capt. Endicott burned two of their villages and destroyed their corn, led to the Pequot war (1687), the brunt of which was borne by the settlers in Connecticut, composed of those who had detached themselves from the parent colony. On the restoration of the Stuarts new troubles threatened Massachusetts. Its protest against the injustice of being subject to the laws of parliament, acquiesced in by the long parliament, was disregarded by the judges under the restoration, and it was declared to be under the legislative supremacy of parliament without restriction. The colony had addressed the king on his return, praying for the continuance of civil and religious liberties; and Leverett, the agent in London, was urged to support their application. Much controversy ensued, and at length in 1662 a commission sent to England obtained a confirmation of the charter from the king, and a conditional promise of an amnesty for all offences during the late troubles; but the king maintained his right to interfere in the domestic concerns of the colony, demanded the repeal of all laws derogatory to his authority, the taking of the oath of allegiance, the administration of justice in his name, the complete toleration of the church of England, and a concession of the elective franchise to every inhabitant possessing a competent estate. These demands did not excite opposition so much for themselves as for the further power they implied, and were strongly opposed by one portion of the community, while the other was willing to yield for the sake of quiet. Commissioners charged to investigate the affairs of the colony, and with "full authority to provide for the peace of the country, according to the royal instructions and their own discretion," arrived in 1664. To nullify the commission, Massachusetts published an order prohibiting complaints to the commissioners, and a remonstrance was addressed to the king. After an unsuccessful attempt to carry out the purposes of their mission, and frustrated in every effort by the vigilance of the colony, the commissioners went northward into Maine, but without effecting any thing of consequence, and were subsequent-

ly recalled. Massachusetts was reproved by the king, while Bellingham, the governor, and Hawthorne, beside 2 or 3 more to be appointed by the colony, were commanded to appear in England. Compliance with this command was after deliberation refused; and this bold act of disobedience, while it raised his anger, excited no further aggression on the part of a monarch who preferred the companionship of favorites and mistresses to the cares of state. The prosperity of the colonies received a severe check in the war with the Indians, called King Philip's war, which commenced in 1675. On the part of the savages the war was one of desperation; they burned villages, lay in ambush for stray parties, fell on defenceless outposts, and pursued the conflict in a spirit of the most sanguinary determination. During this war, which lasted till the latter part of 1676, and was terminated by the death of Philip, 12 or 13 towns were destroyed, more than 600 of the colonists perished in the field, and about 600 houses were burned. Of the men 1 in 20 had fallen, and of the families 1 in 20 was houseless, while the expenses reached the enormous sum for that day of \$500,000. Though the war had been conducted without assistance from England, it had hardly ceased when an emissary from that country, Edward Randolph, arrived. His pretensions were disallowed, and he returned to further excite the hostility against Massachusetts. A committee of the privy council, at the suit of Mason and Gorgee, subsequently denied her right of jurisdiction over Maine and New Hampshire, which thus became separated; but through a private negotiation she purchased the title to Maine, which she retained until 1820. Notwithstanding many concessions, the colony failed to effect a reconciliation with the king. In 1684 the high court of chancery in England gave judgment for the crown against the governor and company of Massachusetts, and their charter was declared forfeited. Joseph Dudley was appointed president of Massachusetts, the general court dissolved, and the new commission superseded the government under the charter. On Dec. 20, 1684, Dudley was superseded by Sir Edmund Andros. The new governor and his council, in the most arbitrary and illegal manner, proceeded to make laws and levy taxes; and this tyrannous rule was submitted to, not, however, without protest and opposition, for more than two years. In April, 1689, reports having been received of the flight of James and the accession of William and Mary, on a rumor of an intended massacre by the governor's guards, the men of Boston, aided by others from the country, rose in arms, imprisoned Andros and others who were obnoxious, and reinstated the old magistrates. Next day crowds from the country came pouring in; the people took the castle and the frigate *Rose*, and occupied the fortifications; town meetings were held, representatives chosen, and the general court was restored. The same spirit prevailed at Plymouth; Clark, the agent

of Andros, was imprisoned, and Hinckley, the former governor, reinstated. Massachusetts took part in 1690 in the intercolonial war between the possessions of France and England. A fleet under Sir William Phipps captured and plundered Port Royal. An expedition to Canada failed, and the colony, being unable to pay the troops, issued treasury notes, the first paper money seen in the colonies. A new charter was given in 1692, by which Plymouth was united to Massachusetts, which had jurisdiction also over Maine and other territory. At this period Massachusetts contained a population of about 40,000. It was divided into the counties of Suffolk, Essex, Middlesex, and Hampshire, and comprised 55 towns. Plymouth, with a population of about 7,000, was divided into the counties of Plymouth, Bristol, and Barnstable, and comprised 17 towns. Under the new charter, the governor, lieutenant-governor, and secretary were appointed by the king. No act of the legislature was to be valid without the consent of the governor, and he had other important negative as well as positive powers. Sir William Phipps was appointed first governor. At about this period occurs an interesting and remarkable episode in the history of Massachusetts, the witchcraft delusion. (See SALEM.) In 1703-'4 the province suffered from the French and Indians, who among other injuries attacked and burned Deerfield, which had been rebuilt since King Philip's war. This war, in which the savages bore so conspicuous a part, lasted for several years, notwithstanding which the province continued to increase in strength and prosperity. In 1722 war was resumed with the Indians, and continued until the latter part of 1725, when the troubles with the Indians, which had now lasted upward of 40 years, were terminated. War having been declared between England and France in 1744, the colonial possessions were at once involved. Massachusetts contributed largely to the expedition which captured Louisburg in 1745, and exerted her best energies in the plans for the conquest of Canada and other military operations until the conclusion of peace in 1748. The temper of the people toward all attempts upon their legal rights is illustrated by a tumult which occurred at this time in Boston, excited by the impressment of some merchant seamen and others for the king's squadron in 1747, and which seemed at one time to threaten serious results. The peace of 1748 did not last long. In a few years war again commenced, and the province once more gave her sons and her wealth to the cause of the parent country. Until 1760, when peace was restored in America, she actively participated in the conflict, which became for all the colonies a school in which their people were to be fitted to take part in a fast approaching and much more important struggle. By none of them were the oppressive measures of the English parliament, which precipitated the revolution, so strenuously resisted as by Massachusetts. She had a population of about 250,000, a large number of

vessels actively employed, and in many departments of industry was well advanced; and she had reached this position despite the oppressions of the mother country. Her course was now plain and decided; her ablest men uttered the boldest and truest sentiments, and her people responded to them enthusiastically. Meetings were held, resolves passed, principles enunciated, and a correspondence with the other colonies invited. These spontaneous expressions on the part of the people were not entirely sustained by the government of the colony. The general court addressed the house of commons in a tone much milder than the sentiments of the people desired. The passage of the stamp act aroused the wildest excitement, and its repeal the following year was welcomed with the most extravagant demonstrations of joy. Further plans for revenue were then proposed by the home government, which also refused to withdraw its troops. The arrival of the Romney man-of-war renewed the excitement, and Massachusetts issued another circular letter to the colonies, which the ministry in vain commanded them to rescind. The Boston massacre in 1770, the destruction of the tea in 1773, the port bill in 1774, are notable incidents preceding the revolution. The province was well represented in the general congress, and the men of Massachusetts were alive to every act of aggression. They took possession of the arsenal at Charlestown, and prepared themselves for the approaching struggle. The assembly adjourned to Concord, and organized as a provincial congress. At Lexington and Concord the issue was made, and Massachusetts for herself and in behalf of her sister colonies made the final appeal to arms. Throughout the revolutionary war Massachusetts sustained her former reputation for patriotism and public spirit, and the details of her history at this period will be found in this work embodied in the lives of her public men, and in the accounts of those places within her borders to which events have given historical interest. In 1780 a constitution was framed for the state, which was submitted to the vote of the people and adopted. By a clause in the bill of rights prefixed to it, slavery was soon decided to have been abolished. John Hancock was elected first governor. Six years later, in 1786, civil disturbances commenced in the centre and west of the state, caused by the poverty and distress of a great portion of the people, and the heavy taxes necessary to pay the state debt. An insurrection, known as Shays's rebellion from the name of its principal leader, Daniel Shays, broke out, and was not suppressed without bloodshed. The federal constitution was ratified by a state convention, which met in Boston, Jan. 9, 1788, and gave its assent by a vote of 187 to 168. After the formation of the government Massachusetts adhered generally to the federal party, and was foremost among the states opposed to the war with England in 1812, though she furnished great numbers of the seamen who manned

the navy by which the most brilliant successes of the war were won. In 1814 she sent delegates to the convention of the New England states which met at Hartford to confer upon the subject of their grievances, and to take such measures for relief as were "not repugnant to their obligations as members of the Union." Of that convention George Cabot of Massachusetts was president. In 1820 a convention to revise the constitution of the state met and proposed various amendments, 9 of which were ratified by the popular vote, and the rest rejected. In the same year the district of Maine was separated from Massachusetts, with the consent of the latter, and erected into a state. In 1857 amendments of the constitution were made, by which the district system of choosing representatives and senators to the state legislature was adopted in place of the apportionment by towns and counties.

MASSACHUSETTS BAY, a large body of water off the E. coast of Massachusetts, and included between Cape Cod on the S. and Cape Ann on the N., about 70 m. long by 25 m. wide. The name was originally applied to the waters of Boston bay only, but has been extended somewhat indefinitely, and now includes several other bays, among which is that of Cape Cod.

MASSAGETÆ, an ancient nomad people of Asia, who dwelt on the steppes adjoining the Jaxartes, or Sir Daria, and the sea of Aral, and according to some extended further to the S. E. They were regarded as Scythæ, being probably of Turanian race, renowned as warlike, and distinguished by some strange peculiarities. Cyrus, the Persian conqueror, is said to have fallen in an expedition against them, when they were commanded by their queen Tomyris. Some critics identify them with the Meshech of the Scriptures.

MASSASOIT, a sachem of the Wampanoags, died in the latter part of 1661, at about 80 years of age. His dominions extended over nearly all the southern part of Massachusetts, from Cape Cod to Narraganset bay; but his tribe, once estimated at 80,000 in number, had shortly before the landing of the pilgrims at Plymouth been reduced by a disease, supposed to have been yellow fever, to barely 800. On March 22, 1621, a little more than 8 months after the founding of Plymouth, he appeared before the infant settlement with 60 of his warriors, armed and painted, for the purpose of forming a friendly league with the white men. Although the tribe were reputed to be cruel and treacherous, the open and friendly greeting of Massasoit so favorably impressed Gov. Carver, that after the necessary formalities were concluded, he formed in behalf of the colony a treaty of peace and mutual protection with the Wampanoags, which for 50 years was sacredly kept by both parties. The friendly disposition of Massasoit toward the colonists never relaxed. He lived within the limits of what is now the town of Warren, R. I., near an abundant spring which yet bears his name, where he

often entertained wandering pilgrims or administered to their necessities. Roger Williams, while on his way to Providence, was for several weeks his guest at this place. Massasoit was just, humane, and honest, never violating his word, and constantly endeavoring to imbue his people with a love of peace. In person, Morton says, in his "Memorial," he was "a portly man in his best years, grave of countenance, spare of speech." His second son, Pometacom, called by the colonists King Philip, who ultimately became sachem of the Wampanoags, was of a less placable disposition, and allowed the encroachments of the colonists to hurry him into the bloody contest known as King Philip's war.

MASSENA, a township of St. Lawrence co., N. Y., bordering on the St. Lawrence river; pop. in 1855, 2,701. The Grass and Racket rivers flow through the town. On the former are the villages of Massena and Massena Centre, at both which the river affords excellent water power; and on the latter are the Massena Springs. These are saline and sulphurous springs, at which there is a considerable summer attendance. There are several manufactories, a bank, and 2 printing offices. In 1855 there were 5 churches (1 Baptist, 2 Congregational, 1 Methodist Episcopal, and 1 Roman Catholic), and 1,227 pupils attending public schools.

MASSENA, *André*, a marshal of France, born in Nice, May 6, 1758, died in Paris, April 4, 1817. It has been said that he was of Hebrew origin, and that his real name was Manasseh. In early life he followed the sea, and subsequently entered the royal Italian regiment in the Sardinian service, in which he served 14 years, without, however, rising above the grade of sergeant. He subsequently returned to civil life; but upon the annexation of Nice to the French republic in 1792, he resumed the profession of arms, and was appointed adjutant major and soon after colonel of the regiment raised in the department of Var. By the end of 1793 he had attained the rank of general of division. His tactical skill in the Italian campaigns of 1794-'5 attracted the attention of Bonaparte, who, upon taking command of the army of Italy in 1796, committed to him the advanced guard. At Montenotte, Millesimo, Castiglione, Arcole, and Rivoli, Masséna distinguished himself; and so successful were all his movements on the battle field that Napoleon surnamed him the "favored child of victory." In Feb. 1798, he was sent to replace Berthier in the Papal States; but the appointment proving unpopular among the troops and the people on account of his character for rapacity and avarice, he soon resigned his command. In the succeeding campaign his operations against the allied Austrian and Russian armies in Switzerland were attended with brilliant success, and the decisive defeat inflicted by him on the Russian general Korsakoff at Zurich (Sept. 25, 1799) saved France from a threatened invasion. Directed by Bonaparte to defend Ge-

noa, which was invested by an Austrian army and blockaded by a British fleet under Lord Keith, he sustained a memorable siege of more than 3 months, and only surrendered when the inhabitants, reduced to desperation by hunger, threatened to rise against him. The concentration of a large Austrian force at this point, however, greatly aided Bonaparte in gaining the important battle of Marengo, fought 11 days after the capitulation of Genoa. Attached from interested motives to the republic, Masséna opposed the establishment of the empire; but his services were deemed by Napoleon too valuable to be dispensed with, and in 1804 he was created a marshal, an event which thenceforth attached him to the imperial cause. During the campaign of 1805 he commanded an army of 50,000 men in Italy, where by skilful manœuvres he occupied the attention of the archduke Charles until Napoleon had gained the decisive victory of Austerlitz; and in the succeeding year he completed the conquest of Naples and established Joseph Bonaparte on the throne of that kingdom. In the campaign of 1809 he commanded the 4th corps of the grand army; and in the march down the Danube to Vienna, and particularly in the hard-fought battles of Aspern and Essling, where his valor and firmness saved the retreating French army from destruction, his services were of great importance. To his conduct in the latter engagement he owed the title of prince of Essling subsequently bestowed on him by Napoleon. At the battle of Wagram, where he commanded the left wing, he was obliged, in consequence of an injury recently received by a fall from his horse, to direct the movements of his troops from a carriage. Seeing his men waver at a critical moment of the day, he caused himself to be placed on horseback, and had scarcely changed his position when the vehicle was shattered by a cannon ball, which struck the very seat he had been occupying. In 1810 he was appointed chief in command of the army of Portugal, with orders to drive the British troops from the peninsula. Crossing the Mondego in the middle of September with 80,000 men, he followed Wellington to the neighborhood of Lisbon, where his progress was arrested by the famous lines of Torres Vedras. He accordingly fell back to Santarem on the Tagus, to await reinforcements from Soult, his army being insufficient to carry the position in which Wellington had fortified himself. But Soult was too fully occupied in the south of Spain to render him assistance, and Masséna, after lingering at Santarem until his army was greatly weakened by sickness and scarcity of supplies, commenced on March 5, 1811, his celebrated retreat into Spain, "in which," says Napier, "he displayed infinite ability, but withal a harsh and ruthless spirit." In the latter part of April he entered Salamanca, having lost 80,000 men within 6 months; on May 5 he fought the bloody but decisive battle of Fuentes d'Onoro; and soon after he was obliged on account of ill health to

resign his command and return to France. During the whole campaign he had been a confirmed invalid, and to his inability to reconnoitre personally Napoleon ascribed the ill result of his operations, and particularly his failure to attack Wellington while entering the lines of Torres Vedras, and before the British troops were in position within the works. His subsequent military career was not remarkable, and after the restoration of his health he held the comparatively inactive post of commander of the 8th military division of the empire. He gave in his adherence to the Bourbons at the restoration, and during the Hundred Days took no part in public affairs.—In military capacity Masséna ranks with the first generals of the empire, although it was said of him that he never began to act with judgment until the battle was going against him, when his extraordinary coolness, confidence, and obstinacy frequently turned the scale in his favor. "On the report of the first cannon," says Napoleon, "his ideas acquired strength and clearness, and in the midst of the dying and the dead Masséna became himself." His private character was stained by imputations of meanness and rapacity, which took a definite form in a series of accusations brought against him by the inhabitants of Marseilles. Napoleon called him a "robber," and even offered him a present of 1,000,000 francs if he would discontinue his speculations, but without success. "Considering the circumstances of the times, however," adds the emperor, "he was precious, and had not his bright parts been soiled by the vice of avarice, he would have been a great man." He paid little attention to discipline or to the comfort of his troops, by whom he was cordially disliked. It deserves to be mentioned to his credit that, though on terms of enmity with Ney, he protested against the competency of the council of war which sentenced him to death.

MASSEY, GERALD, an English poet, born near Tring, Hertfordshire, in May, 1828. He was the child of a poor and illiterate couple, who lived in a hovel, and were barely able to feed and clothe their children. His whole education was confined to a few months at a penny school, where he learned to read and write; and at 8 years of age he was sent to work in a neighboring silk mill, his little weekly earnings, which never exceeded 1s. 3d., being deemed indispensable to eke out the subsistence of the family. From this unhealthful labor, which confined him 12 or 13 hours a day, he was released by the destruction of the mills; and soon after he was employed in straw plaiting—an occupation, if possible, more unwholesome than the other. Living in a marshy region and deprived of opportunities for exercise, the whole family were sometimes prostrated by agues, and their life became a constant struggle with want and misery. Young Massey nevertheless contrived to read whatever books were accessible to him, and at the age of 15, when he went to London to seek employment as an

errand boy, had made himself familiar with the Bible, the "Pilgrim's Progress," "Robinson Crusoe," and a few Wesleyan tracts. In the metropolis, while following his humble occupation, he read with avidity whatever came in his way, sitting up until 2 or 3 o'clock in the morning. At 17 years of age he fell in love, and under the influence of his passion felt the first impulses to poetical composition. "The first verses I ever made," he says, "were upon 'Hope,' when I was utterly hopeless; and after I had begun I never ceased for about 4 years, at the end of which time I rushed into print." Some of these early poems, dwelling upon the sufferings of the poor, and the "power of knowledge, virtue, and temperance to elevate them," appeared in the columns of a provincial journal; and subsequently a collection of them was published in his native town, Tring, under the title of "Poems and Chansons." The French revolution of 1848, by inducing him to look into the causes of poverty and misery and the anomalies of social life, and to view politics through the medium of such authors as Paine and Volney, "had the greatest effect on him of any circumstances connected with his life." Under the influence of the time, he started in conjunction with some fellow workingmen, in April, 1849, a cheap weekly newspaper called the "Spirit of Freedom," edited and half written by himself, and which became the vehicle of many articles from his pen of an ultra radical tone. His extreme political views, and the irregular life which his editorial duties imposed upon him, cost him 5 situations within 11 months. He however brought himself into some prominence among people of his class, and, by aiding the Rev. F. D. Maurice and the Rev. Charles Kingsley in their plans for coöperative labor by means of workingmen's associations, made a favorable impression upon those gentlemen. About the same time he married, and his poems, published occasionally in the London journals, began to attract notice. In 1853 appeared his "Ballad of Babe Christabel, with other Lyrical Poems," which passed through 5 editions within the next two years, and the favorable comments upon which by the chief critical authorities of the kingdom encouraged him to enter upon a literary career. With this object he removed to Edinburgh, where he has since resided. His latest volume of poems, entitled "Craigcrook Castle," appeared in 1856, and has, with his other poetical works, been republished in Boston (16mo., 1857).

MASSIE, NATHANIEL, an American pioneer, born in Goochland co., Va., Dec. 28, 1763, died in Ohio, Nov. 13, 1813. At the age of 17 he entered the revolutionary army, in which he served for a brief period; and he subsequently studied surveying. Uniting this occupation with that of locator of lands, he received ample employment from the large proprietors of western Virginia, and gradually became the owner of considerable tracts of wild land. In 1791 he located the first settlement within the

Virginia military district of Ohio, situated between the Scioto and Little Miami rivers, and between 1793 and 1796 he was engaged in an extensive series of surveys of the same region. In the latter year he laid out upon his own lands in the Scioto valley the town of Chillicothe. At the commencement of the present century he was one of the largest land owners in Ohio, became a member of the state senate, was elected a major-general of the militia, and in 1807 was a candidate for the office of governor. His competitor, Col. Meigs, who received a majority of the votes, having been decided to be ineligible on technical grounds, Massie was declared duly elected. Under the circumstances, however, he declined to accept the office, and retired to private life.

MASSIEU, JEAN, a deaf mute, born at Semens, now in the department of Gironde, France, in 1772, died in Lille in 1846. His parents were poor, and of their children 6 were congenital deaf mutes. At the age of 13 he was admitted into the school for deaf mutes at Bordeaux, then taught by the abbé Sicard. In 1790 or 1791 he accompanied the abbé to Paris, and about 1793 was appointed a tutor in the Paris institution for the deaf and dumb, where he continued till 1823, when, soon after the death of Sicard, he returned to Bordeaux, and, a year after, became the director of a school for deaf mutes at Rhodéz, department of Aveyron. A few years later he removed to Lille, where he established a school for deaf mutes, which was successful, and where he remained till his death.

MASSILLON, a town of Stark co., Ohio, on the left bank of the Tuscarawas, on the Ohio canal, and on the line of the Pittsburg, Fort Wayne, and Chicago railroad, 189 m. N. E. from Columbus, 259 N. E. from Cincinnati, and 80 m. S. from Cleveland; pop. estimated at 4,000. It is in the midst of a very productive country, and has an active trade in flour, grain, and wool. It contains 7 churches (Disciples', Episcopal, German Evangelical, Lutheran, Methodist, Presbyterian, and Roman Catholic), 2 banks, about 40 stores, 3 founderies, 3 machine shops, 1 woollen factory, and 2 newspaper offices.

MASSILLON, JEAN BAPTISTE, a French prelate and pulpit orator, born in Hyères, Provence, June 24, 1663, died Sept. 18, 1742. He studied with brilliant success under the Oratorians in his native city, and entered their congregation in 1681, his father having vainly tried to interest him in law. At first he conceived that both his talents and tastes disqualified him for the ministry, and he preferred to be a teacher of belles-lettres and theology; but his superiors overruled him. In the monastery of Sept Fonts he was appointed to reply to the charge of the cardinal de Noailles, which office he fulfilled with remarkable brilliancy andunction; and from that time his talents and culture were directed toward the pulpit. He had been a professor successively at Pernes, Montbrison, and Vienne, and had gained distinction by several funeral orations, especially

by that delivered at Vienne on Henri de Villars, when in 1696 he was called to Paris to take charge of the seminary of St. Magloire. His sermons soon made him the rival of Bourdaloue, whom alone of contemporary preachers he admitted to be worthy of imitation. In 1698 he succeeded Bourdaloue in a mission to Montpellier. In 1699 he preached during Lent in the church of the Oratory at Paris, where Bourdaloue was one of his listeners; and delivered before the court at Versailles an advent sermon, which caused Louis XIV. to say to him: "I have heard many great orators, and been satisfied with them; but when you spoke, I was very dissatisfied with myself." His sermon on the small number of the elect was delivered for the first time at St. Eustache, and with so great effect that the entire audience rose during the peroration, "as if looking for the archangel to sound." This passage was selected by Voltaire, in the article *Éloquence* in the *Encyclopédie*, as presenting "the boldest figure and one of the finest strokes of eloquence to be found either in the ancients or moderns." In 1704 he preached a second time at court, and though Louis XIV. expressed his desire to hear him every two years, he was not again invited. He preached the funeral sermon of the prince of Conti in 1709; of the dauphin in 1710; and of the king in 1715. In 1717 he was appointed to the bishopric of Orléans, and was invited to preach during Lent before the young king. The 10 sermons, entitled *Petit carême*, which he composed for this occasion, are among his masterpieces, and are esteemed models of French prose and eloquence. From this time the orator gave place to the bishop, and he rarely left his diocese. In 1719 he was received into the French academy, and in 1723 he preached at St. Denis the funeral sermon of the duchess of Orleans, his last pulpit performance in Paris. He was noted for zeal, charity, and liberality, illustrated his precepts in his life, and delighted to unite Oratorians and Jesuits at his table, and to converse on topics of literature and art. As a preacher, he was called the Racine of the pulpit. Unlike Bourdaloue, who, as described by Mme. de Sévigné, "terrified his audience, striking blindly on every side, and impressing them with a feeling of *saux qui peut*," he excels in unction and tenderness, and charms by the elegance and grace of his style. As the tendencies of the 18th century began to manifest themselves, his eloquence, without ceasing to be that of a divine, became more and more that of a moralist and philosopher. His complete works have been published by his nephew (14 vols., 1745-'6), Renouard (18 vols., 1810), Beaucé (4 vols., 1817), Méquignon (15 vols., 1818), and Chalandre (8 vols., 1847). His *éloge* before the academy was written by D'Alembert.

MASSINGER, PHILIP, an English dramatic poet, born in Salisbury in 1584, died in London, March 17, 1640. The son of one of the earl of Pembroke's retainers, he was probably edu-

cated in his native city, till in 1602 he was entered at St. Alban's hall, Oxford. There, according to Anthony à Wood, he occupied himself with poetry and romances instead of logic and philosophy, and left the university before receiving a degree, probably on account of the withdrawal of supplies by his patron, the earl of Pembroke. Gifford conjectures from some passages in his works that he became a Roman Catholic at Oxford, and was therefore alienated from his former friends. He repaired to London in 1606, and though he may have betaken himself immediately to dramatic composition, little is known of his life till the publication of his earliest drama, the "Virgin Martyr," in 1622. His name occurs in Henslowe's diary in 1614 in connection with two actors and dramatic authors, and from 1618 he was engaged as joint author with Fletcher, Field, and others. Most of his 18 extant plays were produced in the 10 years following 1622; the "Bashful Lover," the latest of them, was written in 1636. His health seems to have suffered from his laborious career, and his obscurity and lonely death appear from the register of his interment: "March 20, 1639-'40, buried Philip Massinger, a stranger." Five of his extant plays are tragedies, and the remainder belong to the serious drama, and may be termed tragi-comedies. His most striking excellences are in the conception of character, in dignity of sentiment, and in grace and melody of style. Less imaginative than others of the secondary dramatists, and deficient in comic powers, he is surpassed by none of them in refinement and in blending gentleness with noble daring in pictures of moral beauty. "Massinger, as a tragic writer," says Hallam, "appears to me second only to Shakespeare; in the higher comedy I can hardly think him inferior to Jonson. In wit and sprightly dialogue, as well as in knowledge of theatrical effect, he falls very much below Fletcher." The "Duke of Milan" is one of the best of his tragedies; "The Picture," "A Very Woman," "A City Madam," and "A New Way to Pay Old Debts," are among his best tragi-comedies. The last alone retains a place on the stage, for which it is indebted to its effective delineation of the character of Sir Giles Overreach. From political remarks in some of his plays it is inferred that he alone among the dramatists of his time did not accept the court doctrine of the divine right of kings. The best edition of his works is that by W. Gifford (London, 1805).

MASSON, DAVID, a Scottish author, born in Aberdeen in 1823. He was educated at Marischal college, Aberdeen, and at the university of Edinburgh, and at 19 commenced his literary career as the editor of a Scottish provincial newspaper. Two years later he went to London, and became a contributor to the magazines, subsequently spent several years in Edinburgh in a similar capacity, and about 1847 established himself again in London, where he has since chiefly resided. Since 1852 he has filled the

chair of English language and literature in University college, London. Of his numerous contributions to the "British Quarterly" and other reviews, a collection was published in 1856, entitled "Essays, Biographical and Critical, chiefly on English Poets." The article on Milton, included in this, has since been expanded into an elaborate life of the poet, of which the first volume appeared in 1859. Among other papers written by him are those on Carlyle's "Latter Day Pamphlets," "Dickens and Thackeray," "Rabelais," "Pre-Raphaelitism in Art and Literature," "Hugh Miller of Cromarty," "De Quincey and Prose Writing," &c. He is now (1860) the editor of "Macmillan's Magazine," established in Nov. 1859.

MASSOWAH, or **MASSOUAH**, a seaport town of Abyssinia, on an island in the Red sea, situated in the bay of Massowah, 250 m. N. E. from Gondar, and 450 m. N. W. from Aden; lat. $15^{\circ} 36' N.$, long. $39^{\circ} 21' E.$; pop. about 8,000. The island on which it is situated is a barren rock about $\frac{1}{2}$ m. long, and from 300 to 400 yards broad. The harbor is deep, well sheltered, and safe, and can accommodate about 50 vessels. Owing to the nature of the island, the inhabitants have no water, save what they can collect in tanks. The island is held by the Turks. In 1859 the French acquired the port of Zula, about 25 m. S. of Massowah.

MASTER OF ARTS. See **ARTS**, **DEGREES IN**.

MASTER SINGERS, a class of minstrels, combining the qualities of poets and singers, who flourished in Germany during the 14th, 15th, and 16th centuries. They were generally of burgher extraction, and in the reign of the emperor Charles IV. were formed into regular corporations, which probably took their origin in the assemblage of minstrels and pupils which used to gather around Heinrich von Meissen, the *Frauenlob*, in Mentz, at the commencement of the 14th century. The seats of these corporations were the imperial cities, Nuremberg being the one in which they flourished most and which longest supported them, and a regular course of apprenticeship was necessary to insure admission to them. The compositions of the members, consisting chiefly of devotional and scriptural pieces, were subjected to a peculiar code of laws, and the chief faults to be avoided, 82 in number, were distinguished by particular names. At public contests in Nuremberg, a board of 4 judges, called *Merker*, having separate functions, sat to hear the poems recited or sung, and mark the faults in each. The first compared the recitation with the text of the Bible lying before him, the 2d criticized the prosody, the 3d the rhymes, and the 4th the tunes. He who had the fewest marks received the prize, and the successful competitors were thereupon permitted to receive apprentices. These corporations began to decline in the 17th century, and are now extinct, that of Ulm in 1839 being the last, and have been succeeded in modern times by the *Liederkränze*, *Sängerbünde*, and other forms of singing societies. The most famous master

singers were Hans Sachs, the Nuremberg cobbler, Muscatblut, Michael Behaim, and Hadlaub.

MASTIO (Gr. *μαστιχη*, from *μασσωμαι*, to chew or eat, so named from the practice of chewing the substance which prevailed formerly as at present in Greece), a resinous exudation obtained from the bark of the *pistacia lentiscus*, a shrub about 12 feet high, found upon the borders of the upper Mediterranean. The drug is obtained chiefly from the island of Scio or Chios in the Grecian archipelago. It was known to the ancients, being correctly described by Dioscorides and Pliny, and that from Chios being particularly recommended by Galen. It is collected during the month of July or August, when the juice slowly exuding from the tree hardens in tears on the bark, or on cloth placed to receive it, or falls upon the ground. The tears are of superior quality, of various sizes, pale yellow color, semi-transparent, roundish, oval, or flattened in form, and brittle in fracture. These are called picked mastic. The more ordinary kind, termed mastic in sorts, is obtained in irregular masses, mixed with bark, sand, and other impurities. Mastic has but little odor or taste. Alcohol dissolves about $\frac{1}{3}$ of it, leaving a copal-like substance. Chloroform, ether, and oil of turpentine are its proper solvents. By the inhabitants of the countries from which it is procured mastic is considered highly efficacious in purifying the breath and preserving the teeth, and it is extensively used for these purposes by the Turkish ladies. It is friable when first put into the mouth, but by chewing becomes soft, and assumes an opaque appearance. It is sometimes used for filling decayed teeth. Dissolved in spirits of wine or oil of turpentine, it makes an excellent varnish. A varnish much esteemed by microscopists is made by macerating half an ounce of mastic and 15 grains of caoutchouc in 2 fluid ounces of chloroform, and filtering in close vessels.

MASTIFF (*canis urcanus*), a variety of the dog family, large and powerful, with truncated muzzle and elevated skull, strong neck, muscular back, and robust limbs; the condyles of the lower jaw are above the line of the upper molars; the head is large, with the ears small and partly drooping; the tail truncated and carried erect; there is occasionally a 5th hind toe. The character of the mastiff seems to spring from a consciousness of power; it is calm, dignified, courageous, not easily irritated, but when angry a most determined and fierce assailant; not abundant anywhere, nowhere found wild. It is rather the independent associate than the servant of man; it is not disposed to form cross-breeds. The supposed wild originals inhabited high mountain ranges in the temperate parts of the eastern hemisphere; if we seek for the original where the race is now the most numerous and in the highest perfection, it would be in the mountains of Thibet, though there exists a similar wild animal in that region; the nearest wild type is the *lycaon* of the Cape of Good Hope (see *HYENA*), which possesses many of

the characteristics of the mastiff, and is probably nearly allied to a northern congener now domesticated and not hitherto known in a wild state; the hair in both is short and shaggy, never like the long and thick fur of the wolf-like dogs. The mastiff form became known to the Greeks about the time of the Macedonian conquest, and the classic Roman writers describe the pendulous lips, fiery eyes, loose folds of skin above the brows, and other characters of the modern mastiff of Thibet. The color of the Asiatic breed is generally very dark, almost black, with a few tan-colored spots about the face and limbs. The mastiff of Thibet is the largest and finest of the breed, and extends through S. and E. Tartary. The English mastiff, perhaps derived from this, but smaller and somewhat crossed with the stag and blood hounds, is more elegant in form and more majestic; the color is usually dark buff, with dark muzzle and ears; one mentioned by Hamilton Smith measured 29½ inches in height at the shoulder, and others are described as daring to engage singly with the lion, and able to cope with the bear and leopard. The mastiffs seem to have an idea of property, and make on this account most excellent watch dogs; they have a strong but not obtrusive attachment to their masters; their sense of smell is inferior to that of the hunting dogs, but their voice is singularly deep and musical; the stories of their sagacity are given in many popular works. On the continent of Europe they are generally white, with large clouds of black or reddish; they have been seen 30 inches high at the shoulder.

MASTODON (Gr. *μαστος*, nipple, and *οδον*, tooth), an extinct proboscidean pachyderm, coming near the elephant, found either in the tertiary or more recent deposits in all quarters of the globe except Africa. This animal has the vaulted and cellular skull of the elephant, with large tusks in the upper jaw, and heavy form; from the characters of the nasal bones and the shortness of the head and neck, it has been concluded that it had a trunk; the crowns of the molars are divided by transverse rows of mammillary conical prominences, whence the name; beside the upper incisors or tusks, the cheek teeth are $\frac{f}{-f}$, succeeding each other from behind forward, as in the elephant, only 2 or 3 being in use at a time; during youth there were 2 short and straight tusks at the end of the lower jaw in the males, which were retained sometimes to adult life. The best known species is the North American mastodon (*M. giganteus*, Cuv., or *M. Ohioticus* of Falconer); this has been fully described in a superb work by the late Dr. John O. Warren, assisted by Dr. J. F. W. Lane ("The Mastodon Giganteus of North America," 2d ed., 4to., Boston, 1855), to which the reader is referred for the fullest details and abundant illustrations of most of the species. A few remains of the mastodon had been discovered in North America as early as 1705, but it was not until 1801 that any thing like a complete skeleton was obtained, when a tolerably

complete one was procured from the morasses of Orange co., N. Y.; this was carried to London in 1802, but was soon returned to this country, where it occupied a prominent place in Peale's museum at Philadelphia until 1849 or 1850, when it suddenly disappeared; it was imperfect, wanting a considerable part of the head, some vertebræ, ribs, and bones of the limbs; it was believed by Dr. Warren to have fallen into the possession of Prof. Kaup of Darmstadt, Germany. Another skeleton, less perfect than the last, obtained at about the same time, was exhibited in Baltimore for years, and in a dismantled state came into the possession of Dr. Warren of Boston in 1848, where it still remains. About 1840 Mr. Koch procured a rich collection of mastodon bones from the banks of the Missouri, and put together a nondescript animal, the so called *Missourium*, which drew crowds of visitors in New York and London, until from the mass of bones of several individuals a tolerably complete skeleton was made up by Prof. Owen, which is now in the British museum. The skeleton now at Cambridge, Mass., was discovered in Warren co., N. J., in 1844; with this young female were found 4 very perfect heads, a number of fine teeth, and several bones. The finest of the skeletons of this species is the one described by Dr. Warren in the work above mentioned; it was discovered at Newburg, N. Y., in 1845, in a swamp usually covered with water, but left dry during that summer; it is now in the city of Boston. Specimens have been found in the states of New York, Kentucky, Alabama, Mississippi, Missouri, Kansas, Texas, and as far as lat. 65° N. Taking Dr. Warren's specimen as the type of this species, the cranium is flatter than in the elephant, narrow between the temporal fossæ, the face becoming twice as wide below the nasal opening; the length of the superior surface, from the vertex to the edge of the premaxillary bones, is 48 inches, and the width between the superior orbital processes 28 inches; the posterior or occipital surface is nearly vertical, roughened for muscular attachments; the temporal fossæ are of great size, indicating the power of the muscles which filled them; the zygomatic processes thick and strong; lower jaw V-shaped, the anterior pointed extremity having on the internal surface a long wide groove for the tongue. The cervical vertebræ have short spinous processes, except the last, which is 6½ inches long; the dorsals are 20, and, with the 8 lumbar, form a considerable arch, the first 7 having very long spinous processes (that of the 8d, the longest, being 23½ inches), and thence gradually diminishing to the last, which is only 4 inches; the transverse processes are also very thick in the first 7; the 1st lumbar measures across the transverse processes 17 inches, of which the body is only 5; the sacrum consists of 5 bones, and is 20 inches long on the lower surface; caudals probably about 22, very strong at the commencement of the tail, which reached to the knees. The pelvis is very strong and mas-

sive, $6\frac{1}{2}$ feet wide across the anterior superior spinous processes; thorax rounded, its anterior opening 2 feet from above downward and 1 foot transversely; sternum keeled below, with a stout pointed protuberance in front. The ribs are 20, 13 true and 7 false, the 1st nearly vertical and resembling a clavicle, and 28 inches long; from this the ribs increase to the 9th, which is $54\frac{1}{2}$ inches, and thence decrease to the last, which is 21 inches; the 5th, flat anteriorly, is 4 inches wide; after the 7th they become rounded; they are not unfrequently found united, as after fracture. The scapula is more nearly equilateral and in this respect more human than in the elephant, and like some of the other bones might in rude ages be easily mistaken for the remains of giant men; its spine is nearly vertical, bifurcating below, the infra-spinous fossa more than 3 times as ample as the supra-spinous, the former having generally a depression near the spine; the glenoid cavity is 11 by 5 inches. The massive humerus is 39 inches long, and the same in its greatest circumference, with a remarkable projection extending $\frac{1}{2}$ down the limb for the deltoid muscle; the circumference of the elbow joint is 44 inches; radius 29 inches long and $6\frac{1}{2}$ wide below; the ulna much the stoutest, and 34 inches long. The fore foot measures nearly 2 feet across; the wrist has 8 bones, in 2 rows of 4 each; metacarpals 5, the 1st or thumb the smallest (4 inches long), the 2d and 4th 5 inches, the 3d (the largest) $6\frac{1}{2}$, and the 5th about $4\frac{1}{2}$; phalanges in thumb 2, and in the others 3 each, supposing an ungual phalanx to be present in all, though wanting in the skeleton. The thigh bone is massive and about as long as the humerus, 17 inches in circumference at the middle and 30 at the lower portion; the knee pan nearly globular; tibia human-like, 28 inches long, 30 inches in circumference above and $18\frac{1}{2}$ in the middle; fibula 26 inches, ascending less high than the tibia, but descending lower to form the external malleolus; feet more depressed, and the toes more radiating, otherwise much as in the elephant. This skeleton is 11 feet high, 17 feet from end of face to beginning of tail, the latter being $6\frac{1}{2}$ feet; circumference around ribs 16 feet 5 inches; tusks about 11 feet, of which $8\frac{1}{2}$ project beyond the sockets. The teeth consist chiefly of dentine invested by enamel, though a layer of cement, thinner than in the elephant, invests the fangs and is spread over the crown. The whole number of teeth is 24, of which rarely more than 8 are in use at one time; they are developed from behind forward in order to relieve the jaws from the excessive weight of the whole at one time; the outer edge of the upper teeth projects beyond that of the lower. Two on each side in each jaw are developed soon after birth, and are shed early. In the lower jaw, the 1st is small, $1\frac{1}{2}$ by $\frac{1}{2}$ of an inch, and $\frac{1}{2}$ of an inch high, with 2 transverse bifid ridges slightly notched, and 2 projecting much curved fangs; the 2d, immediately behind it, has the same characters, but is larger, $1\frac{1}{2}$ by $1\frac{1}{2}$ inches,

and $1\frac{1}{2}$ inches high, with a prominent heel; the 3d is 3-ridged and 6-pointed, 3 by 2 inches, and $1\frac{1}{2}$ high; the 4th is $8\frac{1}{2}$ by $2\frac{1}{2}$, and $1\frac{1}{2}$ inches high, with the inner mastoid eminence notched; the 5th is $4\frac{1}{2}$ by 3 inches, with the inner points notched; the 6th is 4-ridged, with complex heel and deeper cleft furrows, 8 by 3 inches, and $6\frac{1}{2}$ high; the last sometimes has 5 ridges. The 1st and 2d of the upper jaw resemble those of the lower; the 3d is 3-ridged, $2\frac{1}{2}$ by 2 inches; the 4th is 3-ridged, 3 by $2\frac{1}{2}$ inches (and sometimes much wider), with the eminences notched; the 5th is also 3-ridged, 4 by 3 inches, each with 2 eminences; the 6th is 4-ridged, with a small heel, the points sometimes bifurcated, and the furrows deep, $6\frac{1}{2}$ by 3 inches, sometimes larger, even to $9\frac{1}{2}$ by $5\frac{1}{2}$, and with 5 ridges. There is no evidence of an additional premolar under the 2d lower milk tooth, though there may be such in the upper jaw, as in other species of mastodon and in the tapir. At an advanced age the 6th tooth remains alone on each side above and below; in a case mentioned by Dr. Warren there was a 7th or supernumerary tooth on one side of the lower jaw, 7 inches long and $7\frac{1}{2}$ high. Beside the upper tusks, there are in the mastodon, though not in the elephant, inferior mandibular tusks. Whether the narrow-toothed mastodon existed in North America must be decided by the origin to be attributed to the so called "Baltimore tooth," said to have been found in Maryland. The food of the mastodon was entirely vegetable, as is proved by the remains of the twigs of coniferous trees, leaves, and other vegetable matter found between the ribs; and the animal doubtless was fond of resorting to marshy and boggy places, like other pachyderms, in search of succulent plants, where it was often mired in the very places whence its remains have been extracted during the 19th century. Around the Shawan-gunk skeleton were found tufts of hair of a dun-brown color, varying in length from 2 to 7 inches; so that the mastodon, like the Siberian mammoth, may have been clothed to withstand a climate considerably colder than those in which modern elephants live. The bones of *M. giganteus* have not been generally found in a mineralized state; in Dr. Warren's specimen the bones are light-colored, of less specific gravity than recent bones, and retain from 27 to 30 per cent. of animal matter (bone cartilage). Both bones and teeth, however, have been found silicified, and they are generally impregnated with iron, which it is well known has a great preserving power.—The geological position of the remains of this species has long been and still is a subject of dispute among geologists; in a few instances they are said to have been found below the drift, in the pliocene, and even in the miocene; but they have generally been obtained from the post-pliocene or alluvial formations at a depth of from 5 to 10 feet, in lacustrine deposits, bogs, and beds of infusorial earth; Pomel and others consider them diluvial; the bones of this mastodon and of the fossil ele-

phant have been found in company in Ohio, South Carolina, Texas, the pliocene of Nebraska, and various other parts of North America. Some have thought that the mastodons became extinct since the advent of man upon the earth, like the *dinornis* and the dodo; according to Lyell, the period of their destruction, though geologically modern, must have been many thousand years ago. The same causes probably acted in their extinction as in the case of the fossil elephant, perhaps partly climatic changes, or more probably some great convulsion on the surface of the globe at an epoch anterior to man.—About 30 species of mastodon have been described, for details on which see the work of Dr. Warren and those referred to by him. In South America lived the *M. Humboldtii* (De Blainv.), belonging to the narrow-toothed group, of which the European *M. angustidens* is the type; this is characterized by the shorter rostrated extremity of the lower jaw, the apparent absence of lower tusks, and folds of enamel more complicated than in the teeth of *M. giganteus*. *M. Andium* (Cuv.), a smaller species, considered by D'Orbigny the same as the last, had the same undulating folds of enamel, but a more elongated symphysis. The distinction between the *M. longirostris* (Kaup) and the *M. angustidens* (Cuv.) of Europe is not well made out, and authors differ exceedingly as to the limits of these species. The division of Pomel seems as probable as any; he describes as *M. longirostris* (or *arvernensis*, Cr. and Job.) those having a lengthened lower jaw, 4 ridges in the 3d, 4th, and 5th teeth, 5 and sometimes 6 in the ultimate molar, tusks in the lower jaw, and a vertical upper premolar; the *M. angustidens* he limits to the Italian species, with the same narrow teeth and 4 ridges in the 3 penultimate molars, with no beak to the lower jaw as in *M. longirostris*, or short truncated gutter as in *M. giganteus*, but with a long horizontal semi-canal slightly inclined downward; the bones, according to De Blainville, resemble more those of the Asiatic elephant than the American mastodon; Dr. Falconer, on the contrary, considers the *M. angustidens* and *longirostris* as perfectly distinct, and the former as more nearly related by a 3-ridged penultimate molar to the *M. giganteus* than to the *M. longirostris*, placing the 1st 2 in the section *trilophodon* (with 3 ridges), and the last with the Asiatic species in the section *tetralophodon* (with 4 ridges to the 3d, 4th, and 5th molars). The famous Dusina mastodon (*M. Turicensis*), discovered near Turin in 1849 in a fluvio-lacustrine deposit, described by Prof. Agassiz, whose description is partially reproduced with a figure in Dr. Warren's work, belonged to the *M. angustidens*; in the same deposit were found remains of elephants and other large pachyderms. Pomel's other species, less clearly made out, are *M. Cutieri*, with a prolonged lower jaw and the 3 penultimate molars with 3 ridges; *M. tapiroides*, with tuberculated teeth, forming a connecting link with those of the *dinotherium* (both of the last are found in

central and southern France, the *M. longirostris* having been found in central Germany, at Epelsheim); and the *M. Buffonis*, with short thick teeth, to which he refers the Siberian specimens. The age of the European mastodons was earlier than that of the American, their remains having been found as low as the miocene, and probably long anterior to the elephant, which was a contemporary of the American mastodon; according to Pomel, *M. angustidens* is found with *M. Buffonis* in pliocene, and *M. Cutieri* and *tapiroides* in miocene lacustrine deposits; but at Turin bones of the elephant, rhinoceros, hippopotamus, and tapir were found with the Dusina specimen, so that the fossil elephant of the old world would seem to have been anterior to that of the new. Pictet describes also *M. brevirostris* (Gervais), from the pliocene of the south of France, with the lower jaw short as in elephants, the lower tusks not at all or slightly developed, and the molars as in *M. longirostris*, with secondary tubercles between the ridges; he mentions other species as found in the pliocene of Puy and Auvergne. Two species found in Asia may be mentioned here in conclusion—the *M. Sivalensis* (Falc. and Cautl.), from the Sivalik hills, and the *M. latidens* (Clift), from the banks of the Irrawaddy; in the former the teeth are of very large size, the ultimate molars being from 8 to 9½ by 3 to 3½ inches, with 6 ridges in the upper jaw, rounded mammillæ, and rather narrow form; in the latter the form is broader, and the teeth sometimes with as many as 10 ridges, and seemingly one of the links connecting mastodon with elephant; these belong to the section *tetralophodon*. The specific name of *tetracaulodon* given by Dr. Godman to some mastodon specimens, from their having 2 tusks in the lower jaw, is now generally admitted to be ill-founded; lower tusks are found in young males of many species, and sometimes one or both in the adult male, their presence being probably a sexual and not a specific character. Dr. Leidy and others have indicated several species of mastodon in Kansas and Nebraska, and other newly explored regions of North America; these are described in the "Proceedings" of the Philadelphia academy of natural sciences during the last 3 years.—According to Owen, the mastodons were elephants with molars less complex in structure and adapted for coarser vegetable food, ranging in time from the miocene to the upper pliocene, and in space throughout the tropical and temperate latitudes. The transition from the mastodon to the elephant type of dentition is very gradual.

MASUDI, ABUL-HASAN 'ALI BEN HUSKIN BEN 'ALI, an Arabian scholar and author, born, according to his own statement, in Bagdad, near the close of the 8d century of the hegira, died probably in Cairo in A. H. 845 (A. D. 956). He belonged to a family illustrious from the time of Mohammed. From childhood he exhibited remarkable talents and fondness for

study, and made immense acquirements in philosophy, literature, geography, and history, attaining a universality of erudition which has been equalled by no other Arab. He was not only familiar with all that concerned the Arabs, but with the history of the Greeks and Romans and of the oriental nations, both ancient and modern, with the religious opinions of the Jews, Christians, heretics, Mohammedans, and barbarous idolaters, and with the systems of Zoroaster and Confucius. On some important questions he expressed ingenious and novel views, which were in advance of his successors for several centuries. Not content with the information contained in books, he undertook several long journeys. About 914 he visited the ancient Persepolis, and passed thence to India, Ceylon, the coast of China, Madagascar, and southern Arabia, and explored the region of the Caspian sea. In 925 he was in Palestine, and he subsequently dwelt in Syria and in Egypt. He says that he travelled so far to the east that he forgot the west, and so far to the west that he forgot the east. His most important work is the *Akhbar-al-zaman*, or "History of the Times," an immense general history, which has never been printed; no copy of it exists in Europe. His second work, entitled *Kitabal-awsat*, or "Book of the Middle," treated curious questions in history, geography, philosophy, and the sciences; but copies of it are very rare, and unknown in Europe. Perceiving that these works were too voluminous to be popular, he wrote a history of smaller compass, entitled *Morudjal-dheheboo-maadinal-djewahir*, or "Meadows of Gold and Mines of Gems," which is not rare in the libraries of Europe. Its translation into English by the oriental translation fund was undertaken, but only the first volume, by Dr. Aloys Sprenger, with the coöperation of the earl of Munster, has been issued (London, 1841). He is the author of a variety of other works on religion, morals, medicine, and the sciences, some of which are extant in manuscript, and others are known only by their titles.

MAT, a coarse fabric made by interweaving strips of the inner bark of trees, flags, rushes, straw, grass, ratans, or similar materials, and used for covering floors, for beds, sails, packing of furniture and goods, and a variety of other purposes. In Paris mats were commonly employed as tapestry for lining the walls of rooms till some time in the last century. They serve among rude nations as a substitute for wooden doors and glass windows. By gardeners they are employed to protect delicate plants from frost, and are very convenient in conservatories for keeping out the cold. Mats are supposed to be the first fabrics that were woven by man; and almost all savage tribes now possess considerable skill in their manufacture. In W. Africa pieces of fine mats have served as money and as standards of value for other commodities. The grass mats of the South sea islanders are often of great beauty for their fineness and the brilliant

colors of their dyes. The Japanese cultivate a peculiar species of rush for making mats, and the softness and elasticity of these well adapt them for beds or floor coverings. The Chinese make ratan floor mats of any size, but chiefly about 7 feet by 5; also rush floor mats, and table mats of ratans and rushes, all of which are exported to other countries. In Europe, mats from reeds and rushes are largely produced in Spain and Portugal; but in Russia the manufacture is a prominent branch of national industry. The material there employed is the bark of the lime or linden tree, and the mats are known in Europe as "bast" mats. In the governments of Viatka, Kostroma, and those adjoining, the villages are said to be almost deserted during the months of May and June, the whole population being in the woods stripping the trees. The peasants make the bark into shoes, cordage, sacks for grain, and matting for many purposes. It is largely exported from Archangel, the shipments in 1851 and 1852 averaging 615,360 pieces per year. It is also sent abroad from St. Petersburg, Riga, and other ports, and is very largely used for packing articles of Russian produce. In view of the immense production of this matting, which according to a Russian authority amounted in 8 of the governments of northern Russia to 14,000,000 pieces yearly, fears have been entertained that the linden tree would be entirely destroyed; but the mats continue as abundant and cheap as ever.

MATAGORDA, a S. E. co. of Texas, bordering on the gulf of Mexico and Matagorda bay, intersected by the Colorado river and Caney creek; area, 1,200 sq. m.; pop. in 1850, 2,124, of whom 1,208 were slaves. The soil of the Colorado and Caney bottoms is deep and rich, equally well adapted for the cultivation of sugar and cotton. West of the Colorado are large prairies with light sandy soil clothed with luxuriant pasture. Timber (mostly oak, cedar, pecan, and hackberry) is confined to the banks of the streams. The productions in 1850 were 108,360 bushels of Indian corn, 89,400 of sweet potatoes, 1,394 hhds. of sugar, and 1,618 bales of cotton. Aggregate value of taxable property in 1859, \$2,506,280.—**MATAGORDA**, capital of the above county, is situated a short distance E. of the Colorado, near Matagorda bay, upon the high prairie, 80 m. from Galveston; present white pop. estimated at 1,200. It has considerable trade in cotton, sugar, rice, corn, &c., receiving the produce of the fertile Colorado valley. It contains a number of stores, 2 churches, and an academy. A lighthouse has been erected. A great storm in Sept. 1854, nearly destroyed the town, blowing down most of the houses; but it has been since rebuilt in an improved style.

MATAMORAS, a town of Tamaulipas, Mexico, on the S. bank of the Rio Grande, 40 m. W. from the gulf of Mexico; pop. 20,000. On the gulf it has 2 harbors, the Brazo de Santiago and the Boca del Rio, about 9 m. apart, with bars passable only in moderate weather. It is

well built, and contains several churches, convents, and schools. It exports specie, hides, wool, and horses, and imports chiefly manufactured goods from Great Britain and the United States. During the war with the United States it was occupied by the American troops.

MATANZAS, a fortified maritime town of Cuba, on the N. W. coast of the island and on the San Juan river, 52 m. E. from Havana; pop. 27,000. The principal edifices are the castle, churches, hospital, theatre, library, and barracks. The harbor is spacious and well sheltered, save toward the N. E.; and the surrounding territory is one of the richest districts in Cuba. In 1858, 373 vessels from and to the United States entered and cleared the port of Matanzas.

MATAPAN, CAPE, the southernmost extremity of Greece. (See **TÆNARUM**.)

MATARO, a seaport of Spain, in the province of Barcelona, 17½ m. by railway (the first built in Spain) E. N. E. from the city of Barcelona; pop. about 15,000. It is situated on the Mediterranean shore, and partly on the declivity of a hill. Linen, cotton, woollen, silk, leather, &c., are manufactured. Mataro has no harbor, and most of its trade passes through Barcelona.

MATCH, a small stick of combustible material furnished with some very inflammable composition, and used for producing fire. Among rude nations fire was obtained by rubbing together two pieces of dried wood; and the practice among civilized people has been to procure it by the flint and steel, catching the particle of steel struck off and rendered red-hot by the friction in dry and highly inflammable tinder. To this succeeded the use of phosphorus, which in 1680, a few years after its first discovery, was introduced for this purpose in London by Godfrey Hanckwitz, who applied it by rubbing it between folds of brown paper till it took fire; it was then made to ignite a stick, one end of which had been dipped in sulphur, and which may be considered the earliest form of the common match. The cost of the phosphorus, however, prevented its general use either in this form or in several others contrived for the same purpose. One of the most successful of these was to partially burn a bit of phosphorus in the confined air of a small vial, the effect of which was to line it with the oxide of phosphorus; the vial was then corked, and when required for use a sulphur match was dipped into it; the match was thus ignited by the chemical action produced, or by afterward rubbing it upon a piece of cork. Another form extensively used were called chemical matches, and were sold in little cases called phosphorus boxes, containing a few matches, at first as high as 15s. each box. They were small sticks of wood dipped first in sulphur, and then in a composition of chlorate of potash, flowers of sulphur, colophony, gum or sugar, and cinnabar for coloring. Accompanying them in the box was a vial containing sulphuric acid, into which the match being dipped, it was instantly ignited by the

chemical action induced between the acid and chlorate of potash. The other ingredients were added merely on account of their combustible qualities. To this succeeded, in 1829, the use of the lucifer match, invented by Mr. John Walker, chemist, at Stockton-upon-Tees. In his experiments upon chlorate of potash, he found that this could be instantly ignited by friction, as in drawing a stick coated with it quickly through folded sand-paper. The salt was made to adhere to wood already coated with sulphur, by dipping this in an emulsion prepared with mucilage, of either phosphorus or sulphuret of antimony and chlorate of potash. The other inflammable ingredients served to retain the fire and communicate it to the wood. Mr. Walker manufactured but few of these matches for use in his neighborhood. Prof. Faraday, learning of them, procured some, and brought them into public notice. Their useful properties were soon perceived, and their manufacture rapidly increased, till it became an important branch of industry in Europe and the United States, furnishing employment to large numbers of men, women, and children. The chief objection to the preparation was the noise produced in igniting the match. This was afterward obviated by the substitution of nitre or saltpetre for the chlorate of potash, and the disagreeable smell of the burning sulphur was diminished by replacing a part of this substance with stearine. The best wood for matches is clear white pine, which possesses the softness required for the manufacturing process, together with the necessary stiffness and inflammability; and the quantity of this consumed in their manufacture is enormous. The wood is first sawed into blocks of uniform size, and the length of two matches. By machines of ingenious construction, these are afterward slit without loss of material into splints, which being collected into bundles and tied are dipped into the composition, first one end and then the other. Another string is then fastened round them, after which they are cut across between the two strings by a circular saw which divides them in the middle. Round matches are formed by forcing the wood endwise through holes in plates, which in the English works are an inch thick, with steel face and bell-metal back. In American establishments tubes are employed whether for round or square splints. The perforations are made as near together as possible, only leaving enough of the metal between to give the necessary strength for cutting. This invention was patented in England in 1842. —The acid fumes thrown off from the phosphorus in the various processes of making matches frequently cause among the people employed a terrible disease which attacks the teeth and jaws; and to such an alarming extent did it prevail in Germany, that the attention of the government was called to it. The dippermen are most liable to suffer in this way, in consequence of standing for hours over the heated slab upon which the phosphorus is spread. An

those persons with decayed teeth are most susceptible to the disease, they are carefully excluded from some manufactories. No antidote has as yet been discovered to this terrible disease. Its natural course is to rot the entire jaw bone away. This generally occupies several years with a steady discharge of matter outside and into the mouth. The pain is not very acute, but is constant, and the sufferer seldom survives the natural course of this disease. Many operations have been performed, chiefly by Dr. Mott at the New York hospital. In some cases the entire jaw bone, and in others only one half or one side of the jaw, has been removed. By this process the disease is arrested, and the patients generally recover. Thorough ventilation and careful attention to cleanliness have been found the most effectual preventives. (See PHOSPHORUS.)—It is a fact worthy of notice that, insignificant as matches are, it is a matter of importance, on account of the immense numbers made, that the manufactories should be situated in districts where timber is cheap. One manufacturer in Herkimer co., N. Y., is said to have consumed within the last 18 years 2,225,000 feet of lumber, producing 6,500,000,000 matches. Probably the largest manufacturer in the United States is Mr. Charles Partridge of New York. His works, for the sake of abundant supplies of material, are in the wooded district of Lewis co., N. Y., near the Black River canal. Beside the wood employed for the splints, large quantities are also consumed for the small cylindrical boxes in which the matches are transported. Some of the splints are exported to the West Indies and South America, where the manufacture of matches has been established within a few years past. The matches themselves are largely exported to the East and West Indies, Australia, China, Mexico, South America, the Pacific coast, &c. The total amount manufactured in the United States is estimated at 7,000 gross of boxes daily, containing 85,700,000 matches, and worth \$8,000.

MATHEMATICS (Gr. *μαθημα*, or *μαθησις*, learning), the science of quantities; or more precisely, the science which has for its object the determination of unknown from known quantities, by means of the relations existing between them. It is defined by Kant as the science of the laws of space and time, since it treats of the quantities occupying space and time, and representable by diagrams, numbers, or symbols. Space is boundless extension; time is endless succession. The former embraces matter; the latter, motion. Mathematics gives and applies the laws of both.—The science is distinguished as pure or mixed mathematics, according as it treats of laws and relations *in abstracto*, with reference to nothing actual, or *in concreto*, with reference to existing phenomena. The former, dealing with abstract quantity, does not imply the idea of matter; the latter, dealing with concrete quantity, embraces

the actual material world. The former gives the absolute forms of the universe; the latter, their illustrations by real examples. The elements employed by the former are self-evident principles, suggested or immediately grasped by the reason itself; the latter applies these principles to natural objects, the properties of which must be learned by induction from experience. The former treats of possible, the latter of actual magnitudes.—The branches of pure mathematics are arithmetic, geometry, algebra, analytical geometry, and the differential and integral calculus. Arithmetic is the science and art of numbers. It does not calculate functions or relations, but special values in every case. Its single elementary idea is one or unity, from which all other numerical values, integer or fractional, are formed. The processes of arithmetic lie at the basis of all others. Geometry measures extension, comparing portions of space with each other. Its elements are not numbers, but lines, surfaces, and volumes or solids. Lines have only the dimension of length, and are either straight or curved. Surfaces embrace both length and breadth, are either plane or curved, and are distinguished as triangles, quadrilaterals, polygons, &c., according to the number of lines within which they are contained. Solids combine the three dimensions of length, breadth, and thickness, and are distinguished as the cube, pyramid, cone, sphere, &c., according as they are bounded by planes, by plane and curved surfaces, or only by curved surfaces. The angle is not an elementary magnitude, but depends on the relative position of lines. Definitions, or statements of *a priori* facts, axioms, or statements of self-evident relations, and propositions, demonstrated from definitions and axioms, as premises, in a series of logical arguments, are the three classes of geometrical truths. Algebra, analytical geometry, and the differential and integral calculus embrace the entire portion of mathematical science in which quantities are represented, not by numbers or diagrams, but by letters of the alphabet. In arithmetic, all propositions concerning numbers embracing units of the same kind, are true without regard to the nature of the quantities to which the numbers may be applied. In geometry, every figure represents all the properties inherent in all the figures of its class. But the truths both of arithmetic and geometry are applicable only to special and actual classes of things. Algebra has a broader generalization. Its symbols extend to all objects whatsoever, and do not suggest ideas of particular things. They stand as representatives of things in general, whether abstract or concrete, real or hypothetical, known or unknown, finite or infinite, possible or impossible. Having the relation of quantities embodied in an equation of symbols, we may proceed to trace what other truths are involved in the one thus stated, resolving the symbolical assertion step by step into others more fitted for our purpose, thus following long trains of symbolical reasoning, every re-

sult of which must express some general truth, though it may not represent any definite and practicable operation upon quantity. Analytical geometry, the application of algebra to geometry, is that branch of mathematical science which examines, discusses, and develops the properties of geometrical magnitudes by noticing the changes which take place in their representative algebraic symbols. The geometrical question is solved by resolving the corresponding algebraic equation. Algebra being defined as the ordinary analysis, calculus is the transcendental analysis, and has various applications in the higher departments of the science. The best achievements of modern mathematics are due to it.—Algebra and geometry are usually, but not with strict accuracy, regarded as types respectively of analytical and synthetical reasoning. The former has an artificial language. Symbols are operated upon according to certain general rules, while the mind dismisses altogether the conceptions of the things which the symbols represent, whether lines, angles, velocities, forces, or whatever else. The steps in the processes are merely applications of the rule. The elements are symbols, and the results are only equations. Geometrical reasoning, on the contrary, is concerning things as they are. It retains the conceptions of quantities. It apprehends the nature of the new truths which it introduces at every step. Analysis is therefore the more powerful instrument for the professed mathematician, but geometry is the more effective mode of exercising the reason, and is a more useful part of the gymnastics of education.—Comte, who makes mathematics preëminent in the hierarchy of the positive sciences, introduces a peculiar classification. Abstract mathematics, according to him, embrace ordinary analysis, or the calculus of direct functions, and transcendental analysis, or the calculus of indirect functions. The former includes arithmetic and algebra; the latter, the differential and integral calculus and the calculus of variations. Concrete mathematics embrace synthetic and analytic geometry, the former being either graphical or algebraic, and the latter being distinguished according as its objects are of two or of three dimensions. Comte includes also rational mechanics, or the laws of statics and dynamics, as a department of concrete mathematics. If the universe were immovable, there would be only geometrical phenomena; but motions are mechanical phenomena.—As commonly explained, the mixed mathematics are the applications of abstract mathematical laws to the objects of nature and art. From the universality and variety of these objects no strict and comprehensive classification of them has been made. Matter in rest and matter in motion are the primary phenomena in space and time. The laws which rule the one and the forces which impel the other are the first objects of inquiry. Mechanics treats of both, and is divided into statics and dynamics, dealing respectively with the equilibrium and the action of forces. Astronomy,

hydraulics, pneumatics, optics, and acoustics may be regarded as subdivisions of dynamics. Surveying, architecture, fortification, and navigation are among the principal applications of mathematics to the arts.—The pure mathematics are merely formal sciences. They occupy and discipline but do not fill the mind. Unlike the elements of metaphysics, their quantities are without quality. The attempt has often been made to ground philosophical speculations upon them, in order to give to the latter mathematical certainty. Thus Pythagoras sought in the ideas of order and harmony mysteriously attached to numbers the reasons for great cosmical phenomena. Plato, who forbade any one unacquainted with geometry to enter his school, combined mathematical with philosophical doctrines especially in his "Timæus," the most obscure of his dialogues. The Neo-Platonists revived the Pythagorean mystical views of numbers. In modern times Wolf and Herbart have been chiefly distinguished for introducing the mathematical method into metaphysical systems. The latter wrote a work on psychology abounding in algebraic formulas. The essential distinction, however, between the elements of the spiritual and the material world, between the fundamental ideas of the two sciences, has prevented any important results from the effort to combine their processes. The definitions, axioms, and processes of mathematics deal with objects of sense, which are known with perfect exactitude, which are apprehended as precisely the same by all, concerning which as phenomena there can be no such thing as opinion, but only absolute certainty, and the reality of the relations between which can be doubted only by disputing the validity of all human ideas. In none of the most scientific metaphysical and moral systems have the definitive and axiomatic elements been thus precisely and authoritatively determined.—The history of mathematics may be divided into three great periods, each characterized by the introduction of important new methods. In the first, the era of Greek and Roman supremacy, geometry was almost exclusively cultivated. While arithmetic was hardly more than a mechanical calculation by means of the abacus, geometrical methods attained a degree of elegance scarcely to be surpassed, as appears from the rank still maintained by Euclid. The Greeks, however, aimed at the exquisite construction of diagrams, not to explain a theory or deduce rules of computation, but for special purposes of measurement. Hipparchus, the father of trigonometry, probably employed mechanical contrivances for the construction of solid angles. The first solution of a difficult problem was the approximate quadrature of the circle by Archimedes. The property of the right angled triangle, supposed to have been discovered by Pythagoras, was known to the earliest Hindoo and Chinese authors of whom there is any record. After the decline of Rome, the sciences took refuge among the Arabs, who translated and preserved the liter-

ary treasures of Greece. The Arab philosophers were, however, rather learned than inventive, and added little to the heritage. But they introduced the second great period in the progress of mathematics by imparting to Europe the decimal arithmetic and the algebraic calculus, both of which were perhaps of Indian origin. The latter, made known in Italy by Leonardo, a merchant and traveller of Pisa, early in the 15th century, soon received important improvements. Scipio Ferrea (1505) was the first to solve a cubic equation. Cardan and Tartalea disputed the honor with him and with each other, while Ferrari solved the bi-quadratic equation, and Vieta (1600), Girard, and Harriot entered upon the general theory of equations. The algebraic analysis was thus brought nearly to its present state of perfection. It was at first regarded merely as a preparatory process in the investigation of a problem, to be afterward exchanged for a geometrical construction and synthetic proof. But it gradually supplanted diagrams as a medium of demonstration, being found to surpass them in force and compass. With Descartes begins the last and greatest revolution of mathematical science. He disputes with Vieta and Oughtred the honor of having first applied algebra to geometry, bringing all the problems of the latter under the dominion of symbolical analysis. His mode of characterizing curves by an equation between two variable magnitudes revolutionized the mode of conceiving geometrical questions. Symbolical language, found adequate for every purpose, soon became the general medium of mathematical inquiry, and has been the principal weapon by which its subsequent splendid triumphs have been achieved. Perceiving the importance of the discovery, Descartes hastened to apply it to questions of the greatest difficulty and generality, and resolved the problems of tangents and of maxima and minima. The methods of Roberval and Fermat tended toward the discovery of the differential calculus, which was made independently by Newton (under the form of fluxions) and by Leibnitz. Already Napier had invented logarithms, and Newton the binomial theorem; Mercator had accomplished the quadrature of the hyperbola, and Wallis the quadrature of many other curves while seeking that of the circle. The integral calculus (the Newtonian method of quadratures), the inverse of the differential, was improved by Leibnitz and the Bernouillis; Euler completed the theory of analytical trigonometry; Fontaine illustrated that of differential equations; Taylor invented the calculus of finite differences or increments; Cavalieri published his method of indivisibles; and other improvements were introduced by Kepler, Huyghens, and Wallis. The *Principia* of Newton (1687) has gained for him the title of "the profoundest of geometers as well as the first of natural philosophers;" and his influence combined with that of Leibnitz in preparing for the subsequent achievements of the mixed mathe-

matics. Euler, D'Alembert, and the last of the Bernouillis were the most distinguished of their successors till near the close of the 18th century. Euler suggested conceptions in the application of analysis which others elaborated in almost every part of mathematical science; D'Alembert established a principle by which every dynamical question was resolved into a statical one; Daniel Bernouilli received 10 prizes from the French academy of sciences; and other contemporaries, as Clairaut and Maclaurin, were completing the application of mathematics to mechanics and physics. In the period embracing the latter part of the 18th and the early part of the 19th century, the names of Lagrange and Laplace had no rivals. By them the application of all modes of calculation to the mechanics of the universe was carried to the highest pitch of generality and symmetry. One of the most remarkable achievements of the science was Leverrier's prediction in 1846 of the place and orbit of the planet Neptune from the motions of Uranus, announcing before its discovery by the telescope the existence, position, and magnitude of a body beyond the recognized limits of our system, merely as an inference from the perturbations of the outermost planet known to us. Poisson, Airy, Plana, Hansen, Gauss, Adams, De Morgan, and Peirce are among the recent mathematicians who have solved important problems in the physical application of analysis.—Among the greatest works in mathematical literature are the *Principia* of Newton, the *Mechanica* of Euler, the *Théorie des fonctions* and the *Mécanique analytique* of Lagrange, the *Application de l'algèbre à la géométrie* of Monge, and the *Mécanique céleste* of Laplace.—See Montucla, *Histoire des mathématiques*, continued by Lalande (4 vols., Paris, 1799–1802); Bossut, *Essai sur l'histoire des mathématiques* (2 vols., Paris, 1802); Comte, *Philosophie positive*, vol. i.; Libri-Carrucci, *Histoire des sciences mathématiques en Italie* (4 vols., Paris, 1888–'41); Fries, *Die mathematische Naturphilosophie* (Heidelberg, 1822); Poppe, *Geschichte der Mathematik* (Tübingen, 1828); Rösling, *Der Mathematik Grundbegriffe, wahres Wesen und Organismus* (Ulm, 1823); Davies, "Logic and Utility of Mathematics" (New York, 1851); and Davies and Peck, "Mathematical Dictionary" (New York, 1856.)

MATHER. I. RICHARD, an English non-conformist divine, who emigrated to America, born in Lowton, Lancashire, in 1596, died in Dorchester, Mass., April 22, 1669. He received a good education, became a schoolmaster at Toxteth Park, near Liverpool, at the age of 15, determined to study for the ministry, was admitted to Brazenose college, Oxford, in 1618, was ordained a few months later, and became the minister of Toxteth, in which position he remained 15 years. He was suspended for non-conformity to the ceremonies of the established church in 1633, and though soon restored by the influence of friends was again silenced in the following year. He therefore decided to emigrate to New

England, avoided the pursuivants who sought to apprehend him, and landed in Boston Aug. 17, 1685. In the following year he was invited to become pastor of the church in Dorchester, where he resided till his death, and exerted great influence by his weight of character and knowledge of ecclesiastical affairs. He was the author of several brief theological treatises and letters, chiefly on church government, and drew up in 1648, at the instance of the Cambridge synod, a model of discipline, which was accepted in preference to others proposed by Mr. Cotton and Mr. Partridge. He married in 1656 the widow of John Cotton. Of his 6 sons by his first wife, 4 were distinguished clergymen and authors: Samuel (1626-'71), in Dublin, Ireland; Nathaniel (1680-'97), in London; Eleazar (1687-'69), in Northampton, Mass.; and Increase. His "Journal, Life, and Death" has been published for the Dorchester antiquarian and historical society (Boston, 1850). The following epitaph was written upon him:

Under this stone lies Richard Mather,
Who had a son greater than his father,
And also a grandson greater than either.

II. INCREASE, an American divine, son of the preceding, born in Dorchester, Mass., Jan. 21, 1639, died Aug. 28, 1728. He was graduated at Harvard college in 1656, and in 1658 at Trinity college, Dublin. He afterward preached in Devonshire and the island of Guernsey, and on the restoration was urged to conform and settle in England; but he refused, and on his return to Boston was invited to preach to the North street church, of which he was ordained pastor in 1664. This office he held for 62 years. He was a member of the synod of 1679, and drew up the propositions which were adopted concerning the proper subjects of baptism. In 1681 he was elected president of Harvard college, but the reluctance of his church to relinquish him induced him to decline the position. In 1684 the office was again offered him, and he accepted it with a stipulation that he should retain his relation to his people. He continued in this station till 1701, when he retired in consequence of an act of the general court requiring the president to reside in Cambridge. He procured an act authorizing the college to create bachelors and doctors of divinity, and received the first diploma for the degree of D.D. that was granted in America. He was engaged also in important political services. When in 1688 Charles II. demanded that the charter of Massachusetts should be resigned into his hands, he was foremost in opposing the measure; and when that monarch annulled the charter in 1685, he was sent to England as agent for the colonies. He was in England during the revolution of 1688, and, having found it impossible to obtain a restoration of the old charter, accepted a new one, under which the appointment to all the offices reserved to the crown was confided to him. He returned in 1692, when the general court appointed a day of thanksgiving for his safety and for the settlement of the dispute. He is stated

to have condemned the violent proceedings which followed relating to witchcraft. He was accustomed to spend 16 hours every day in his study, and always committed his sermons to memory. One tenth part of all his income was devoted to purposes of charity. He was the author of 92 distinct publications, now mostly very scarce. His "Remarkable Providences" was republished in the "Library of Old Authors" (London, 1856), with an introduction by George Offor. He married a daughter of John Cotton. III. CORRON, an American divine, son of the preceding, born in Boston, Feb. 12, 1668, died Feb. 18, 1728. He manifested an early passion for books and learning, studied at the free school in Boston, and entered Harvard college at the age of 12; and at his graduation in 1678 Pres. Oakes expressed his expectation that he would resemble his venerable grandfathers John Cotton and Richard Mather, who should be united and flourish again in him. He was early distinguished for piety, was accustomed to frequent prayer as a school boy, reprov'd his associates for profanity or misconduct, in his 14th year began a system of rigid and regular fasting and vigils which he continued through life, and at the age of 16 made the Christian profession. He was occupied after leaving college with teaching, and was for a time diverted from his purpose of becoming a preacher by an impediment in his speech; but having discovered how to avoid stammering by a "dilated deliberation" in his enunciation, he devoted himself particularly to theological studies, in 1680 became the assistant of his father in the pastorate of the North church, Boston, and in 1684 was ordained as his colleague. He discharged his pastoral duties with singular zeal, pursuing his studies, elaborately preparing his sermons, publishing numerous works of devotion, secretly praying for special and suitable blessings on each member of his church, ejaculating prayers for those whom he met when he walked the streets, and availing himself of every occasion to inculcate lessons of piety. It was his aim also to maintain the ascendancy which had previously belonged to the clergy in New England in civil affairs, but which was then on the decline. "New England," he wrote, "being a country whose interests are remarkably inwrapped in ecclesiastical circumstances, ministers ought to concern themselves in politics." When, at the report of the landing of the prince of Orange in England, Gov. Andros was seized and imprisoned in Boston, Cotton Mather prepared the public declaration justifying the measure. But it is in connection with proceedings concerning witchcraft that he is most generally known. It appears that his influence rather encouraged than restrained the delusion; but the belief in this kind of supernatural agency was common at that time, doubts existing only as to particular cases. In 1685 he published his "Memorable Providences relating to Witchcraft and Possessions," narrating cases which had occurred at intervals in different parts of the country, which was used as an authority in

the prosecution of the "Salem tragedy." When the children of John Goodwin became curiously affected, in 1688, he was one of the 4 ministers of Boston who held a day of fasting and prayer, and favored the suspicion of diabolical visitation. He afterward took the eldest daughter to his house in order to inspect the spiritual and physiological phenomena of witchcraft, and his experiments are wonderful instances of curiosity and credulity. He discovered that the devils were familiar with the Latin, Greek, and Hebrew, but seemed less skilled in the Indian languages, suspected that they were not all alike sagacious, and was persuaded that he himself was shielded against their power by special protection of Heaven. A discourse, in which he pronounced witchcraft "the most nefarious high treason against the Majesty on high," was printed with a copious narrative of his recent researches, and the particulars were reprinted in London with a preface by Richard Baxter. When the first phenomena occurred at Salem in 1692, he at once became a prominent adviser concerning them, expressing his eagerness "to lift up a standard against the infernal enemy," whose assaults upon the country he regarded as "a particular defiance upon my poor endeavours to bring the souls of men unto heaven;" and in order to convince all who doubted the obsessions and disapproved of the executions, he wrote his "Wonders of the Invisible World" (1692), a work which received the approbation of the president of Harvard college and of the governor of the state, though it was designed to encourage the excesses and to promote "a pious thankfulness to God for justice being so far executed among us." When the reaction in the popular mind followed, he vainly attempted to arrest it; and though he afterward admitted that "there had been a going too far in that affair," he never expressed regret for the innocent blood that had been shed, and, instead of taking the responsibility on himself and his coadjutors, charged it upon the powers of darkness, whose skill and malignity "had circumvented them, and made them proceed against persons who were not guilty." Finally, he sought to shun the odium of the popular feeling by declaring the subject "too dark and deep for ordinary comprehension," and referring it for decision to the day of judgment. By the publication of Robert Calef's "More Wonders of the Invisible World" (London, 1700), in which the veracity of many of the narratives of Mather was disputed, the delusion was at length dissipated. Though his influence consequently declined, his activity continued. The most learned of the alumni, he expected to have been called to the presidency of Harvard college in 1707, and was again disappointed in 1724 that this office was conferred on another. His publications amounted to 882, many of them small books and sermons. His *Magnalia Christi Americana* (London, 1702; 2 vols., Hartford, 1820) is a chaotic collection of materials for an ecclesiastical history of New England, concern-

ing which he was admitted to know more particulars than any other man. Though strongly marked by his partialities and prejudices, its somewhat quaint and grotesque character, its admixture of superstition, learning, and ingenuity, make it still interesting. In 1713 his *Curiosa Americana* was read before the royal society of London, and he was elected a member of that body, being the first American to receive this distinction. In its "Transactions" in 1721 appeared an account of the practice of inoculation for the small pox, recently introduced by Lady Mary Wortley Montagu; and it was by the efforts of Mather in connection with Dr. Boylston, against both professional and popular prejudice, that the operation was first performed in Boston. His "Essays to Do Good" (1710) was admitted by Dr. Franklin to have influenced some of the principal events of his life; and his "Christian Philosopher" and "Directions for a Candidate of the Ministry" enjoyed high repute. His greatest undertaking was entitled "Illustrations of the Sacred Scriptures." He labored industriously upon it from his 31st year to his death, and it now forms a prodigious manuscript volume in the library of the Massachusetts historical society. His life was written by his son, Samuel Mather (1729), and again by W. B. O. Peabody in Sparks's "American Biography." IV. MOSZA, D.D., an American clergyman, a descendant of Richard Mather, born in Lyme, Conn., Feb. 28, 1719, died in Darien, Conn., Sept. 21, 1806. He was educated at Yale college, of which he was a fellow for 18 years. In 1744 he was installed over the Congregational church in Darien, Conn., of which he remained the pastor until his death. He warmly espoused the cause of the colonies in the war of the revolution, and was twice taken captive by the British and Tories, and carried to New York, where he was confined in the Provost prison. He published a pamphlet in reply to Dr. Bellamy on the half-way covenant, and a sermon on predestination; and was the author of a posthumous work entitled "A Systematic View of Divinity, or the Ruin and Recovery of Man" (12mo., 1818).

MATHEW, THEOBALD, D.D., "the apostle of temperance," born in Thomastown, co. Tipperary, Ireland, Oct. 10, 1790, died Dec. 8, 1856. His father was an illegitimate member of the family of the earls of Llandaff, and died while his children were still young. Theobald was adopted by his aunt, who sent him to an academy at Kilkenny, whence he passed at the age of 20 to the college of Maynooth. While here he resolved to embrace a monastic life, and accordingly he entered a Capuchin convent at Kilkenny, where he remained until after his ordination in 1814, when he was placed in charge of a chapel in Cork. About this time he received from Rome the degree of D.D., and a dispensation permitting him to hold property. His urbane manners and charitable disposition soon acquired for him an extraordinary influence. He interested himself warmly in the

condition of the lower classes, and organized, on the plan of the society of St. Vincent de Paul, a religious association for visiting the poor and sick, in which he induced numbers of young men to enroll themselves. In 1838 his attention was called to the temperance movement by an invitation from a number of teetotalers in Cork to join them in devising means for the prevention of drunkenness; and a total abstinence society was formed, of which he was unanimously chosen president. Thirty-five persons took the pledge at his hands at once; on the following day several hundreds joined the society, and in the course of 5 months he numbered 150,000 converts in the city of Cork alone. No small part of this success was due to Father Mathew's personal popularity. The rapid improvement which was remarked in those who took the pledge served to increase the general enthusiasm, and many of the more ignorant even ascribed to their leader the power of working miracles. He was invited to all parts of Ireland. In Limerick the crowds who came to hear him from the furthest parts of Connaught were so large, that but for the liberality of the citizens there would have been a famine in the place. He now gave up every thing else to devote his life to the cause of temperance. At Galway he administered the pledge to 100,000 persons in two days, and after visiting every large town in Ireland he went to London, Liverpool, Manchester, and other places in England, where he was received with the greatest enthusiasm. His benevolent labors had involved him deeply in debt, and although he received from the queen a pension of £800, the whole or most of it was applied to paying an insurance on his life for the benefit of his creditors. His brother, a wealthy distiller in Ireland, assisted him until his business was ruined by the progress of the temperance movement. Another of Father Mathew's brothers and his brother-in-law were also engaged in the liquor manufacture. After travelling and lecturing for some time in England with scarcely less success than in his native country, he visited the United States, lecturing in the principal cities, and returned to Ireland in the autumn of 1851.

MATHEWS, CHARLES, an English actor, born in London, June 28, 1776, died in Plymouth, June 28, 1835. He was educated at the merchant tailors' school, and subsequently was apprenticed to his father, a bookseller in the Strand. Gifted with strong powers of mimicry, he gradually imbibed a predilection for the stage, and, after appearing at several provincial theatres as an amateur, was engaged as a comedian at the theatre royal, Dublin. Meeting with unjust treatment here both from the manager and the public, he determined to return to his father's business; but on the way to London he was tempted to accept an engagement at Swansea, where he performed for some time with success. After filling an engagement of several years at York, he became a member of the Haymarket company, and on May 16, 1803,

made his début before a London audience as Jubal in "The Jew." He continued for many years to perform at the principal London theatres; but feeling that the parts assigned to him did not afford fair scope for the exercise of his talents, he instituted in 1818, in imitation of Foote and Dibdin, a species of entertainment in the form of a monologue, which, under the title of "Mathews at Home," proved very successful. For 5 successive seasons he drew crowded audiences to the English opera house, where, by his comic songs, recitations, anecdotes of personal adventure, and imitations of well known actors, he greatly enhanced his reputation. In 1822-'3 he made a successful tour in the United States, where he gathered materials for his "Trip to America," which was received with not less favor than his "At Home." He continued both entertainments for upward of 10 years longer, appearing at intervals on the stage in the regular drama; and in 1834, at the urgent request of American managers, he returned to America and performed his "Trip" to delighted audiences. He died soon after his return to England. His powers of mimicry, in which he has scarcely been approached by modern actors, combined with an expressive countenance, a flexible voice, and keen discernment, gave him a high position on the English stage. He had the faculty of identifying himself with the part he personated, and his Mawworm, Sir Fretful Plagiary, Morbleu, Monsieur Mallet, Multiple in the "Actor of All Work," &c., were among the most finished and original conceptions of the comic drama. His imitative powers were abundantly displayed in his "At Home," which was written for him by various authors in succession. In private life he was greatly esteemed, and possessed the friendship of Coleridge, Lamb, and other eminent men.—CHARLES, son of the preceding, born in the early part of the present century, was educated as an architect, but subsequently went upon the stage, and has for a number of years held a prominent place as a light comedian. In connection with his wife, better known as Madame Vestris, he was for years manager of the Olympic and Lyceum theatres in London. In 1857-'8 he made a professional tour in the United States, where he was married a second time.

MATHEWS, CORNELIUS, an American author and journalist, born in Port Chester, N. Y., Oct. 28, 1817. He was graduated at the university of New York, and commenced his literary career in 1836 by a series of contributions in prose and verse to the "American Monthly Magazine." During the next two years he contributed to the "New York Review," the "Knickerbocker Magazine," and other periodicals, and in 1839 published "Behemoth, a Legend of the Mound Builders." In 1840 he produced "The Politicians," a comedy, and in 1841 "The Career of Puffer Hopkins," a novel illustrating various phases of political life in New York. His remaining works comprise "Poems on Man in the Republic" (1843); "Big Abel and Little Man-

hattan" (1845); "Witchcraft," a tragedy, first performed in Philadelphia in 1846, and which Margaret Fuller called "a work of strong and majestic lineaments;" "Jacob Leisler," a play produced in Philadelphia in 1848; "Money-penny, or the Heart of the World" (1850); "Obanticleer, a Thanksgiving Story of the Peabody Family" (1850); "A Pen and Ink Panorama of New York City" (1853); "False Pretences," a comedy (1856), &c. He was also for some time associate editor of "Arcturus," a monthly magazine, has edited various journals and contributed largely to the "Literary World" and other periodicals, and has been an active advocate of international copyright.

MATHEWS, GEORGE, an American jurist, born near Staunton, Va., Sept. 21, 1774, died at Bayou Sara, La., Nov. 14, 1836. He was the son of Gen. George Mathews, an officer of the revolutionary army, and subsequently governor of Georgia, and after a brief course of study at Liberty Hall academy, Rockingham co., Va., was in 1799 admitted to the bar of Georgia. In 1805 he was appointed by President Jefferson judge of the superior court of Mississippi territory, and in the succeeding year one of the judges of the superior court in the territory of Orleans. Although he had little knowledge of the civil law, and no experience in the system then prevailing in the territory, and which was rendered more complicated by engrafting upon the combined French and Spanish codes in vogue certain fundamental principles of the common law, his decisions did much to form a permanent system of jurisprudence. On the organization of the state judiciary of Louisiana Judge Mathews was appointed presiding justice of the supreme court, a position which he filled during the remainder of his life.

MATHIAS, THOMAS JAMES, an English author, born about 1750, died in Naples in 1835. He was graduated at Trinity college, Cambridge, in 1774, and several years later received an appointment in the royal household, which he held until 1818, when he retired on a pension. He commenced his literary career by publishing a volume of "Runic Odes" imitated from the Norse (4to., 1781), and in 1788 produced an "Essay on the Evidence relating to the Poems attributed to Thomas Rowley." In 1794 he published the first part of an anonymous poem, of which 8 other parts subsequently appeared, entitled the "Pursuits of Literature," remarkable for stinging criticisms on literary men and opinions. It was followed by a variety of minor pieces of a satirical character, after which he published in 1814 an edition of the works of Thomas Gray, with his life and additions (2 vols. 4to., Cambridge). The latter part of his life was passed at Naples, where he wrote and published much on Italian literature.

MATSYS, MEYSYS, or MEYSYS, QUINTIN, a Flemish painter, born in Louvain about 1460, or according to some authorities in Antwerp in 1450, died in Antwerp in 1529. He was of humble extraction, and brought up as a black-

smith, in which trade he continued until about his 20th year, when, according to the popular story, he became enamored of a painter's daughter, and in order to win her hand forsook the anvil for the easel. He probably studied with his wife's father, but his peculiar style and excellence in his art were due to his own genius and industry. He painted in the dry, hard style of the early Flemish masters, colored highly, and was distinguished for minuteness of finish and force of expression, particularly in pathetic religious subjects; although elsewhere he exhibits a peculiarly cheerful and fresh conception of life, and occasionally considerable humor. His chief work is the great altarpiece in the museum at Antwerp, consisting of a centre and two wings; in the former is represented the "Descent from the Cross," of which Sir Joshua Reynolds says: "There are heads in this picture not exceeded by Raphael;" the latter are devoted to incidents in the history of St. John the Baptist and St. John the Evangelist. The artist received but 300 florins for this work; but Philip II. subsequently endeavored in vain to purchase it, and Elizabeth of England is said to have offered the enormous sum of 64,000 florins for it. One of his best authenticated works is that in Windsor castle known as "The Misers," of which several repetitions are in existence. The heads are painted in a masterly manner, and are full of character. About 70 pictures are ascribed to him, and these are widely distributed throughout the chief galleries of Europe, and are highly prized.

MATTER, JACQUES, a French philosopher and historian, born in Alt-Eckendorf, department of Lower Rhine, May 31, 1791. Though of German parentage, he was early habituated to the use of the French language. He was intended for the legal profession, and enjoyed the best educational privileges under private instructors, at the gymnasium of Strasbourg, and under Heeren and Eichhorn at Göttingen. He went to Paris with a diplomatic career in view, attended the lectures of the faculty of letters, and wrote his *Essai historique sur l'école d'Alexandrie*, which, crowned by the academy in 1816, gave him reputation among those French scholars who were interested in German erudition, and was published in 1820. By favor of Royer-Collard and Guizot he received in 1819 a professorship in the college of Strasbourg, which he exchanged two years afterward for the direction of the gymnasium and the professorship of ecclesiastical history in the Protestant academy of the same city. Applying himself to the study of ecclesiastical history and philosophy, he wrote his *Histoire critique du gnosticisme* (2 vols., Paris, 1828), and *Histoire universelle de l'église Chrétienne* (3 vols., 1829-'32). In 1828 he was appointed inspector of the academy of Strasbourg, and in 1831 corresponding member of the academy of inscriptions. His treatise *De l'influence des mœurs sur les lois et des lois sur les mœurs* (Paris, 1832) received from the academy an extraordinary prize of

10,000 francs. In 1832 he was appointed by Guizot general inspector of the university of Paris, and removed to that city. Among his later productions are: *Histoire des doctrines morales et politiques des trois derniers siècles* (8 vols., 1836-'7); *De l'affaiblissement des idées et des études morales* (1841); *Schelling et la philosophie de la nature* (1842); *De l'état moral, politique et littéraire de l'Allemagne* (2 vols., 1847); *Histoire de la philosophie dans ses rapports avec la religion* (1854); and *Philosophie de la religion* (2 vols., 1857). He has also written occasional treatises concerning schools and education, and numerous articles in the *Dictionnaire de la conversation* and other cyclopædias. As a philosopher, he inclines rather to the Scotch than the German systems.

MATTHEW, SAINT, one of the 12 apostles, and author of the first Gospel. The New Testament tells us little of his personal history. He was a son of Alphaeus, and a receiver of customs at the lake of Tiberias. Jesus, while passing one day, said to him: "Follow me;" and Matthew at once obeyed. Most exegetical writers assume that the publican Levi, whose call to the discipleship is recorded by Mark and Luke, is the same person as Matthew; yet among the opponents of this view are Origen, Grotius, Michaelis, and Ewald. After the ascension of Christ, we find Matthew at Jerusalem, with the other apostles, continuing "with one accord in prayer and supplication, with the women, and Mary the mother of Jesus, and with his brethren." Then history loses sight of him. He is said to have preached the gospel during 15 years in Jerusalem, and then to have turned to other nations. Among these are mentioned the Ethiopians, Macedonians, Syrians, Persians, Parthians, and Medes. (See Wiltach, "Geography and Statistics of the Church," London, 1859.) He is said to have been burned alive in Arabia Felix; and according to Baronius, his body was brought to Palermo in 954. The Roman Catholic church keeps his festival on Sept. 21, the Greek on Nov. 16. —The Gospel of Matthew was, according to the unanimous tradition of the ancient church, composed in Hebrew, or rather Aramaic, the language spoken at that time in Palestine. Following Erasmus, a number of eminent Protestant theologians, as Calvin, Beza, Lightfoot, Oredner, De Wette, Ewald, &c., and among Roman Catholics Hug, have contested the correctness of this tradition, and advocated the originality of the Greek text; but the opposite theory has found able defenders, among whom are Rich, Simon, Marsh, Olshausen, Baur, and Delitzsch, and has clearly regained of late the ascendancy in the theological world. Opinions again are divided as regards the relation of the Greek text contained in the canon to a lost Hebrew original. Some, as Bengel, Olshausen, and Guericke, regard it as probable that the Greek translation was made either by Matthew himself or with his consent and co-operation; but this is more commonly denied. A considerable number of distinguished theo-

logians, as Lachmann, Oredner, Ewald, Reuss, and Meyer, infer from a passage of the early ecclesiastical writer Papias, that Matthew himself compiled only a summary of the sermons and sayings of Christ, which was put into historical form by another writer. But weighty authorities have since shown that this passage of Papias admits of another interpretation. The Gospel, whether composed in Hebrew or in Greek, was undoubtedly written for Christians of Jewish descent in Palestine. The time of its composition is entirely uncertain. The statements of the ecclesiastical tradition vary from A.D. 41 to 67; a majority of modern writers seem to agree in fixing it between 60 and 67. The chief aim of this Gospel is evidently to prove the Messianic character of Jesus. For its relation to the Gospels of Mark and Luke, see MARK; and for collective commentaries on all the four, or the first three Gospels, see LUKE. The commentary of Olshausen is especially valuable. The commentary by De Wette was in the former editions pervaded by the views of Strauss, but the 4th and last edition (1856) has been revised by a theologian of the orthodox school. More information on the origin and genuineness of the Gospel of Matthew may be found in Sieffert, *Ueber die Echtheit und den Ursprung des ersten Evangelii* (1832); Schneckenburger, *Ueber den Ursprung des ersten Evangelii* (1834); Schott, *Ueber die Authentizität des Ev. Matth.* (1837); Kern, *Ueber den Ursprung des Ev. Matth.* (1837).

MATTHEW OF WESTMINSTER, an English historian of the end of the 12th or beginning of the 13th century. He was a Benedictine monk of the abbey of Westminster, where he spent his life, and composed his *Flores Historiarum* in 8 books, the 1st of which extends from the creation to the birth of Christ, the 2d to the Norman conquest, and the 8d to the death of Edward I. The *Flores Historiarum* was published in London in 1567, and at Frankfort in 1601. A translation of it by C. D. Yonge forms 2 volumes of Bohn's "Antiquarian Library" (1858).

MATTHEWS, a S. E. co. of Va., bordering on Chesapeake bay; area, 68 sq. m.; pop. in 1850, 6,714, of whom 2,928 were slaves. It is a peninsula, having the Piankatank river on the N., the Chesapeake on the E., and Mobjack bay on the S. W., and connected with the mainland by an isthmus 1 mile wide; length 20 m., greatest width 8 m. It has a level surface and moderately fertile soil. The productions in 1850 were 7,640 bushels of wheat, 4,940 of Indian corn, and 4,059 lbs. of wool. Value of real estate in 1856, \$749,863; increase since 1850, 18 per cent. There were 9 churches, and 400 pupils attending public schools. Ship building is prosecuted. Capital, Westville.

MATTHEWS, GEORGE, an American soldier and statesman, born in Augusta co., Va., in 1739, died in Augusta, Ga., Aug. 30, 1812. At the age of 22 he commanded a volunteer company against the Indians, and acted a very important part in the battle of Point Pleasant,

at the junction of the Ohio and Kanawha rivers, Oct. 10, 1774. He held a colonel's commission in the revolution, and was present at the battles of Germantown and Brandywine. At the former he was taken prisoner, and confined on board a prison ship in New York harbor. He was not exchanged until after the termination of the war, when he joined the army under Gen. Greene, as commander of the 8d Virginia line. Subsequently he purchased a tract of land on Broad river, in Oglethorpe co., Ga., to which he removed with his family. In 1780 he was elected governor of Georgia, and reelected in 1794-'5.

MATTHIAS, a religious impostor, whose real name was Robert Matthews, born in Washington co., N. Y., about 1790, died in Arkansas. He kept a country store, married in 1818, and maintained an excellent reputation until 1816, when he failed and went to reside in New York. In 1827 he removed to Albany, where he became much excited by the preaching of the Rev. Messrs. Kirk and Finney. He afterward engaged actively in the temperance cause, and, claiming to have received a revelation, took to street preaching. Failing to accomplish his avowed object of converting Albany, he prophesied its destruction and fled secretly to the city of New York, where he involved a number of respectable families among the victims of his delusions; was tried and acquitted on a charge of poisoning a wealthy disciple in whose family he was domesticated; and his impositions having been exposed, he lost his influence, and soon disappeared from public view.—See "Matthias and his Imposture," by W. L. Stone (New York, 1835).

MATTHISSON, FRIEDRICH VON, a German lyric poet, born near Magdeburg in Jan. 1761, died near Dessau, March 12, 1831. Having developed considerable talents as a poet, and gained great popularity with the public, he was patronized by various German princes, but retired from court life in 1824. His "Elegy in the Ruins of an Old Castle" is one of his finest lyrics. He edited selections from the lyric poets of Germany under the title of *Lyrische Anthologie* (20 vols., Zürich, 1803-'7). His posthumous works were published in Berlin in 1832.

MATTO GROSSO, the westernmost province of Brazil, between lat. 7° and 24° S., and long. 50° and 65° W., bounded N. by Alto Amazonas and Para, E. by Goyaz, S. by Parana, and W. by Bolivia; area, 406,500 sq. m.; pop. in 1856 estimated at 85,000, mostly Indians. This immense region is covered to a great extent with dense forests, and traversed by a mountain chain which forms the principal watershed between the basins of the Amazon and the Rio de la Plata. From this chain numerous ramifications proceed, whose intervening valleys gradually expand into vast plains of exuberant fertility. The principal rivers are the Madeira,

Juruena, and Chingua, which flow N. to the Amazon, and the Parana, Paraguay, and Cuyaba, whose course is S. There are several lakes, and some of considerable size. The chief vegetable productions are rice, millet, cotton, sugar, tobacco, gums, balsams, and medicinal plants. Among the animals are the puma, jaguar, wolf, deer, and hare, and almost every variety of the feathered tribe. Minerals abound in many districts. This province is among the finest diamond districts of Brazil. The diamonds of Matto Grosso are very small, but exceed in brilliancy all other Brazilian diamonds.

MATURIN, CHARLES ROBERT, a British dramatist and novelist, born in Dublin in 1782, died there, Oct. 30, 1824. He was educated at Trinity college, Dublin, received holy orders and became curate of St. Peter's in his native city. To increase his limited income, he devoted his leisure to literary composition; and in 1807 he published the "Fatal Revenge, or the Family of Montorio," a novel written in the style of Monk Lewis and Mrs. Radcliffe. It was followed by several other romantic fictions, as the "Milesian Chief," the "Wild Irish Boy," "Women, or Pour et Contre," and "Melmoth the Wanderer," the wildest of them all, the hero of which is a sort of absurd Dr. Faustus, in league with Satan, and performing all manner of marvels. His last romance, the "Alligensee," appeared just before his death. In 1816 his tragedy of "Bertram" was accepted by the management of Drury Lane theatre, through the influence of Lord Byron, and was produced with Kean in the principal part. By its performance and its publication the author realized £1,000. His subsequent tragedies, "Manuel" and "Fredolpho," are very inferior. He also published a poem on the "Universe," and a volume of "Controversial Sermons." He was noted for his eloquence in the pulpit.

MAUCH CHUNK, the capital of Carbon co., Penn., situated on the W. bank of the Lehigh river at its passage through the Mahoning mountain, and on both sides of the mouth of Mauch Chunk creek, 112 m. N. by W. from Philadelphia; pop. in 1850, 3,727. The town is built chiefly in the valley of the creek, between the Mahoning and Sharp mountains, in so contracted a place that no room is afforded for gardens to the houses. The hills on each side rise precipitously to the height of several hundred feet, and not far back attain an elevation of more than 1,000 feet above the river. The place derives its importance from the mines of anthracite and of iron ore found in the Sharp mountain at this eastern extremity of the southern anthracite field of Pennsylvania. The mines of Summit hill or Sharp mountain, 9 m. W. from the village, up the valley of Mauch Chunk creek, have been famous as among the oldest known and most productive of the coal mines in the state. One bed more than 50 feet thick has been worked over many acres, and its products are brought down with those of the other mines of the vicinity to Mauch Chunk to

be sent down the Lehigh canal. The cars run by gravity the whole distance to Mauch Chunk, and were formerly drawn back by mules, which made the descent in cars provided for them. But by a bold system of engineering a return track is now laid out, along which the cars descend from the chutes at the canal to the foot of Mt. Pisgah, the high point of Sharp mountain next the river, and are then raised to its summit up an inclined plane by a stationary steam engine. From this point they then run 6 m. by gravity to the foot of another inclined plane, up which they are raised as before, and from its summit descend to the different mines. The Lehigh canal, with the slack water navigation of the Lehigh, is continued 25 m. further up the river to Whitehaven, whence a railroad is extended to Wilkesbarre in the northern anthracite field. The engineering work upon the river and canal is exceedingly bold and massive, some of the dams across the river being 50 feet high, and the lift of the water in the locks 88 feet. The timber collected from the forests on the mountains adds largely to the business of the canal and of Mauch Chunk. The town has 5 churches, 2 large blast furnaces for smelting iron, and 2 weekly newspaper offices.

MAULMAIN, or MOULMEIN, a port of Tenasserim, on the E. side of the bay of Bengal, at the mouth of the Salwin, on a small peninsula formed by that river and the Gyne and Attaram, and nearly opposite the Burmese town of Martaban; lat. $16^{\circ} 30' N.$, long. $97^{\circ} 42' E.$; pop. about 20,000. The banks of the river are lined with jungle from its mouth to the town, and the horizon is bounded, at the distance of from 1 to 6 m., by hills which run parallel with the stream and are covered with trees to their summits. The native houses are raised on piles, about 10 or 12 feet from the ground, and are formed of mats and palm leaves. The houses of the Europeans and those of the wealthier class of Burmans are built entirely of wood, also raised upon piles. There are a few scattered brick buildings. The native town consists of one long street, which runs for nearly 4 m. along the bank of the Salwin, and a few others which branch from it toward the heights on the E. and connect it with the European houses. There are several wooden jetties along the shore. The inhabitants of Maulmain consist of Burmans, Malays, Chinese, Bengalese, and Madrasese, with a few Armenians, Jews, and Cingalese. A considerable number of Europeans are settled there, and a few American missionaries, among whom the Rev. Dr. Judson was formerly the most prominent. There are 7 Christian churches, 5 of which are Protestant, 8 English and native schools, and 2 printing presses. Maulmain is a place of considerable trade, principally with Calcutta, Madras, Rangoon, and Penang. The exports consist chiefly of timber, ivory, wax, stick lac, caoutchouc, cajuput oil, gum resins, nut oil, sandal wood, dammar, tanning substances and dyes, bees, and sapan wood. With the exception of timber, all the articles used in ship building are

imported, beside cotton cloth, coarse earthenware, sugar, tobacco, arms, and gunpowder. The forests in the immediate neighborhood of Maulmain yield an abundant supply of teak timber, and ship building is successfully carried on, many vessels of large size and superior class having been built. The total value of the trade, both export and import, is nearly \$3,000,000 per annum. When the Tenasserim provinces were ceded by the Burmese to the British, in 1826, the site upon which Maulmain stands was covered with jungle overrun by tigers. The heat is not so oppressive as on the coast of Coromandel, the thermometer seldom rising above 90° in the shade.

MAUNA LOA, or MOUNA ROA ("long or high mountain"), a volcano of the Sandwich islands, situated a little S. of the central part of the island of Hawaii, 40 m. from the coast. Its height, as ascertained by Lieut. Wilkes of the U. S. exploring expedition, is 18,758 feet. From the sea it presents the appearance of a smooth, regular hill of no great elevation, clad with forests part way up its sides, and rounded off at the top like a dome. It has been built up by the accretions hurled from the bowels of the earth by volcanic agency (to which indeed the whole island owes its origin), but unlike many other volcanoes it has no cone of ashes. Its craters are numerous, occurring on the summit and on the sides, and new ones are frequently opening. The terminal crater, called by the natives Moku-a-weo-weo, is about 15,000 feet in length and 8,000 in width; its W. bank is 784 feet in depth and its E. bank 470 feet. The bottom was reached by Wilkes, who describes it as traversed by ridges from 10 to 50 feet in height, alternating with deep chasms, smooth beds of hardened lava, and fissures from which issue clouds of steam and smoke. A short distance to the N. of it is the smaller crater of Pohakuohanalei, and when Lieut. Wilkes was here (Dec. 1840) there were two others on the summit. The whole top of the mountain is one expanse of lava, which has been thrown out in a fluid state, and lies like a smooth mass of metal, or in vast beds of clinkers spread over an area of miles, and occasionally raised from 10 to 20 feet above the surrounding surface. There is no rock nor sand to be seen. On the S. E. side of the mountain is a pit crater 88 feet deep by 200 feet in diameter, in which Dr. Judd, who accompanied Lieut. Wilkes, was overtaken by a sudden eruption and narrowly escaped death, though not without a few burns. In 12 minutes from the first outbreak the pit was full of molten lava. On the same side of the mountain, at an elevation of 4,104 feet above the sea, is the great crater of Kilanea, which is $3\frac{1}{2}$ m. long, $2\frac{1}{2}$ m. wide, and 1,044 feet deep. A black ledge of hardened lava, from 600 to 2,000 feet in width, surrounds it at a depth of 660 feet, and the bottom is occupied by a surging lake of liquid fire, over which hangs a cloud, silvery by day and glowing red by night. Vapors and steam escape

from numerous apertures; and even in times when the fires are comparatively at rest, masses of red-hot matter are every now and then cast up to the height of 60 or 70 feet. During Lieut. Wilkes's visit (Jan. 17, 1841) the lake overflowed, and in one night discharged about 15,000,000 cubic feet of lava, while the discharge from the small pit, which he called Judd's lake, was calculated to amount in a day to 200,000,000 cubic feet. Kilauea was long held in awe by the natives as the abode of the goddess Pele, and the slender threads of hardened lava spray which are collected around it are called by them "Pele's hair." During the last 4 or 5 years Mauna Loa has been unusually active. A violent eruption occurred in 1855, lasting 18 months, and sending its streams of lava over an area estimated at 800 sq. m. Another began Jan. 28, 1859. Three new craters were opened in the side of the mountain, the highest being about 10,000 feet above the sea. The two lower were the scenes of the most violent action. They are about a mile apart, and were described by an observer as two cones of pumice and lava, each about 150 feet high; from the lower one, which was nearly 1,000 feet in diameter, rose a column of liquid lava from 200 to 500 feet high. From this place the fiery torrent found its way by a subterranean passage to an outlet about half a mile distant, where it bubbled up in a pool a few rods wide, and poured in a cataract, at a white heat, over a precipice of 50 feet. It spread over the whole lower slope of the mountain in a network of streams, and passing around the N. side reached the sea in 5 days, destroying a fishing village in its way. The meeting of the lava and the waves is described as one of the most terrific sights ever witnessed. In November the flow still continued; the lava on reaching the water, full 40 m. from the crater, was still at a light red heat, and moved with a velocity of 2 or 3 m. an hour. The stream in some places was 5 or 6 m. wide. Kilauea in the mean time continued comparatively quiet, but its fiery lake was gradually increasing in size, and in Nov. 1859 had risen to a level with the black ledge described by Wilkes. This rising of the lake has occurred before, as the structure of the ledge indeed shows, but it never runs over, its discharge always being effected by subterranean channels. Several shocks of earthquake accompanied the great eruption of 1859, two in February, one in July, and two in November.

MAUPERTUIS, PIERRE LOUIS MORREAU DE, a French geometer and astronomer, born in St. Malo, July 17, 1698, died in Basel, July 27, 1759. He was 5 years in the army, during which time he studied mathematics with great success; but he abandoned the service in 1728, and was admitted into the academy of sciences. The ability which he displayed in opposing the physical theory of Descartes, which was maintained by Fontenelle, and substituting for it that of Newton, gained him admission in 1727 into the

royal society of London. The controversy had excited public interest, when the French government resolved to verify one of the hypotheses of the British philosopher, that of the flattening of the terrestrial globe near the poles. Maupertuis was at the head of a commission of academicians, which in 1736-'7 measured a degree of longitude in Lapland; and the result, confirming the conjecture of Newton, gave him distinction throughout Europe. He was invited by Frederic the Great to Berlin, where he became president of the academy founded by Leibnitz, married a lady of a distinguished family, and received large pensions. In 1750 he became involved in a controversy with König, who disputed one of the principles which Maupertuis claimed to be an immense discovery in physics, and who moreover maintained that the principle was a plagiarism from Leibnitz. The leading savants of the time took part in the discussion, but the learned memoirs of Euler in defence of Maupertuis were an insufficient answer to the wit and satire of Voltaire in his *Diatribes du docteur Akakia, médecin du pape*. The latter years of his life were afflicted by illness, and he died at the house of Bernouilli while on a journey in Switzerland in quest of health.

MAUR, CONGREGATION OF ST., a congregation of reformed Benedictines in France, celebrated for the zeal with which they devoted themselves to literature. Their body was organized in 1618, and confirmed in 1621 and 1627. It comprised at one time about 124 houses, was divided into 7 provinces, and governed by a general who resided in Paris. All the generals of the congregations were distinguished scholars. Literature owes to this congregation a number of laborious works, especially the best collective edition of the Greek and Latin church fathers. Montfaucon, Mabillon, and Ruinart belonged to it. The congregation was broken up by the French revolution, and an effort of the few surviving members to effect its reestablishment in 1815 did not succeed. In 1833, however, the first convent was restored at Solesmes in the diocese of Le Mans, the monks of which have conjointly undertaken the publication of the *Spicilegium Solesmense*, a collection of inedited works and fragments of ecclesiastical antiquity, which has been well received in the literary world.—See Herbst, *Die Verdienste der Mauriner um die Wissenschaften* (in the *Theolog. Quartalschrift* of Tübingen, 1833 and 1834).

MAUREPAS, JEAN FRÉDÉRIC PHELYPEAUX, count, a French statesman, born in 1701, died in 1781. He was grandson of the chancellor Pontchartrain, and at the age of 14 years succeeded his father as secretary of state, the administration of the office being intrusted to his relative the marquis de La Vrillière till the death of the latter in 1725, when he became himself the acting minister. He discharged the duties of this office till 1749, embellished the capital, sent La Condamine, Maupertuis, and other savants to measure an arc of the meridian on the equator and another near the north pole, and

promoted the expeditions of Sevin and Fourmont to Greece and the Orient, and of Jussieu to Peru. An epigram which he wrote upon Mme. de Pompadour caused his banishment from court for 25 years; he remained two years at Bourges, and then lived near Versailles. He was recalled by Louis XVI., again became president of the council of state, restored the exiled parliaments, called Turgot and Necker successively into the ministry, but sacrificed them when they became his rivals, and by his fickle and frivolous administration hastened the catastrophe of the French revolution. Instead of serious efforts to save the government, he opposed reform with bon-mots and epigrams. The *Mémoires du comte de Maurepas* were published by the abbé Soularie (4 vols., Paris, 1792). They consist of materials which his secretary Sallé is supposed to have collected under his directions.

MAURICE, count of Nassau and prince of Orange, stadtholder of the United Dutch Provinces, born at Dillenburg, Nov. 14, 1567, died at the Hague, April 23, 1625. He was the 2d surviving son of William I. of Orange, surnamed the Silent, by Anna, the daughter of Maurice of Saxony. Maurice of Nassau was 17 years of age when his father was assassinated at Delft by Balthasar Gérard, a Burgundian fanatic (1584), and in spite of his youth was soon after proclaimed governor and captain-general by the states of Holland and Zealand, his elder brother Philip William having been carried by the duke of Alva to Spain, where he was educated in the Catholic religion. The celebrated grand pensionary Barneveldt, who managed the diplomatic affairs of the United Provinces, was equally attached to the freedom of his country and to the interests of the house of Orange; but yielding to the pressure of circumstances he opposed neither the ineffectual offer of the sovereignty of the states to the king of France, nor another to the queen of England. The latter, without assuming the proffered dignity, promised aid against the common enemy, Philip II. of Spain, and appointed her favorite Leicester governor and captain-general of the republic. Maurice, though commencing his military career under the control of the count of Hohenlohe, was elected in 1587, by the states, to fill the same dignity during the absence of Leicester, who had made himself generally detested, and, after the recall of the latter by Queen Elizabeth, was acknowledged as stadtholder and commander-in-chief by all the provinces, Lord Willoughby commanding the English auxiliary forces. Opposed to the greatest captain of that period, the duke of Parma, Philip's governor of the Netherlands, who in 1585 took Antwerp, Maurice soon proved worthy of such a rival; and the frequent expeditions of the duke into France, where Spain supported the league against both Henry III. and Henry IV., afforded ample opportunity for advantages over the enemy. In 1590 he covered himself with glory by the surprise and capture of Breda, and in the following year took Zutphen, Deventer, Nimeguen, and

other places. The conquest of Gertruydenberg (1593) and Groningen (1594), after protracted sieges, manifested still more clearly his abilities; and his camp soon became, like that of the duke of Parma, who died in 1592, one of the great schools of the military art, to which warlike youths flocked from every Protestant country. The two fortresses fell before the eyes of the successors of Farnese, one general, though with superior forces, being unable to break the prince's lines before Gertruydenberg, and another not even attempting to rescue the gallant defenders of Groningen. In these and many subsequent conquests, Maurice was assisted by the English auxiliary troops under Sir Francis Vere, and he was still more indebted to the aid of the latter in his first battle in the open field, before Turnhout in Brabant, where he routed the Spaniards and compelled the fortress to surrender (1597). In the following year Philip II. of Spain died, having bestowed the sovereignty of the Netherlands upon his daughter Isabella, betrothed to the archduke Albert of Austria. Philip III. conscientiously executing the will of his father, Albert assumed the government in Brussels, and demanded from the United Provinces a voluntary submission to their new rulers. The republic answered only by a more vigorous prosecution of the war by land and sea. Maurice routed the archduke at Nieuport near Ostend (1600), the issue of the battle being long disputed, and the English under Sir Francis Vere claiming the principal honor of the victory. The Protestant army, however, was exhausted, and Albert was allowed to resume the field with superior forces, and to commence the siege of Ostend, while Maurice successively laid siege to other places. The resistance of Ostend was heroic, and lasted for more than 3 years; but when the Italian Spinola, who was now to dispute with Maurice the glory of being the first general in Christendom, took the command of the besieging army, all efforts to save the fortress proved vain, and an honorable capitulation ended the struggle, which had cost the king of Spain no fewer than 80,000 men. Maurice had in the meanwhile achieved numerous conquests, which more than balanced the loss of Ostend; while the exertions of the republic on the sea, both in the East, where the conquest of the Spice islands was commenced, and in America, were of equal importance. The colonial possessions of Spain and of Portugal were successfully attacked, the latter country having been conquered by the former; the Dutch East India company was founded; and the commerce of the seas was wrested from the enemy. Spinola himself advising peace, Philip III. finally yielded, and a truce for 12 years was concluded at the Hague (1609), under which the Dutch retained their liberty and conquests. This termination of the struggle was owing chiefly to the diplomacy of Barneveldt, Maurice resisting it, from ambition, to the last. Bent on usurping supreme power, Maurice was ready to sacrifice the interests of his country in order to retain

his command ; and when checked by the energy of the veteran statesman, he eagerly sought for his destruction. The son of William the Silent, having achieved immortal glory by his military genius, which made him the founder of modern tactics, now stained the fame of his house by atrocious conduct toward its noblest benefactor. The religious conflict of the Gomarists and Arminians served as a means. Maurice hypocritically flattered and excited the passions of the former, while Barneveldt adhered to the latter. The synod of Dort was convoked (1618), a mock trial was held, and his religious and political opponent perished on the scaffold (1619). Grotius and others were thrown into prison. A son of Barneveldt, who undertook to avenge his father, was executed. The people, however, awakening to a feeling of shame and regret, now punished Maurice by unconcealed detestation, and he thus entirely lost the fruit of his crimes. Only the renewal of the war after the expiration of the truce (1621) restored him to popularity. He compelled his great rival Spinola to raise the siege of Bergen-op-Zoom (1622), for the conquest of which he had sacrificed 10,000 of his best troops, but was unable to rescue Breda, his grief on the fall of which (1625) is believed to have caused his death. His elder brother having died, as restored prince of Orange, in 1618, the younger, Frederic Henry, succeeded as stadtholder.

MAURICE OF SAXONY. See **SAXE**.

MAURICE, JOHN FREDERIC DENISON, an English clergyman and author, born in 1805. He is the son of a Unitarian minister, conspicuous for his learning, benevolence, and activity in promoting Christian enterprises, and was sent at a comparatively early age to Trinity college, Cambridge, where he contracted a friendship with John Sterling, only interrupted by the death of the latter, and which was more closely cemented by their marriage to two sisters. At the university he enjoyed a considerable reputation for scholarship, and passed his examinations with so much distinction that he was recommended to the authorities for a fellowship, which he declined on the ground that, being a dissenter, he could not sign the 39 articles of the church of England, and take a degree. It was then proposed to him to keep his name on the college books for a year or two, on the supposition that within that time his scruples might be overcome ; but he steadfastly refused, and left the university without taking a degree. Repairing with his friend Sterling to London, he embarked in a literary career, was for some time connected with the "Athenæum," then recently established by J. S. Buckingham, and published a novel entitled "Ernest Conway." At the end of two years he experienced such a change of religious sentiment as induced him not merely to become a member of the church of England, but a candidate for holy orders. From apprehension, however, that his motives in taking this step might be misinterpreted, he took his degree at Oxford instead of Cambridge, and

about 1828 received ordination. Entering upon his new duties with the purpose of making the theology of his church minister to the social wants of the people, he has since pursued a career of activity and usefulness in that direction, although, from the peculiar nature of his doctrinal views, he has encountered much opposition. Allying himself from the outset with that movement in the established church now known as the "Broad Church" party, and of which Dr. Arnold of Rugby was the acknowledged pioneer, he has since the death of the latter been commonly regarded as his successor in its leadership. His personal influence, remarkable in his university career, has secured the party many adherents ; and his numerous writings, nearly all of which are devoted to the exposition of "Broad Church" views, have been widely circulated in Great Britain and America. Prominent among these are his "Theological Essays" (8vo., London, 1853 ; republished in New York, 1854), which, from their supposed heterodoxical idea of the atonement and eternal punishment, were severely attacked in many quarters, and ultimately cost him the professorship of divinity which he held in King's college, London. Among others, Dr. Candlish of the Scottish church combated his views in a sermon delivered in Exeter hall, and subsequently published under the title of "Examination of Mr. Maurice's Theological Essays." His other most important works are : "The Kingdom of Christ: Hints on the Catholic Church ;" "Sermons on the Lord's Prayer ;" "The Doctrine of Sacrifice deduced from the Scriptures ;" "Lectures on the Ecclesiastical History of the First and Second Centuries ;" "Prophets and Kings of the Old Testament ;" "Patriarchs and Lawgivers of the Old Testament ;" "The Unity of the New Testament ;" "Christmas Day, and other Sermons ;" "Religions of the World ;" "Sermons on the Prayer Book ;" "The Church a Family ;" "Sermons on the Sabbath Day ;" "Philosophy anterior to the Time of Christ," "Philosophy of the first Six Centuries," and "Philosophy of the Middle Ages," which were enlarged from the pages of the "Encyclopædia Metropolitana," where they first appeared ; "Lectures on National Education," &c. Not less remarkable than his efforts in behalf of "Broad Church" doctrines has been his advocacy of what is popularly known as "Christian socialism," in which he has found an able and enthusiastic colleague in the Rev. Charles Kingsley. Believing that their sacred office imposed upon them the duty of promoting the social and material as well as the spiritual welfare of the people, they coöperated with other earnest men in establishing associations of artisans and laborers, who, by undertaking work in common and sharing the proceeds, might be able to overthrow the system of competitive labor which kept them down, and thus gradually develop their intellectual resources and improve their social standing. With a view of preparing working men for these new duties and rela-

tions, he founded a workingmen's college in London, to which of late years he has devoted much time and attention. His efforts in behalf of female education deserve no less honorable mention. His views on social questions have encountered opposition as decided as his theological opinions, and few persons in England holding ecclesiastical office possess warmer friends or more determined adversaries. Of the attachment manifested to him by the former an instance is afforded in the poetical epistle of Alfred Tennyson, inviting him to the isle of Wight. For several years he has held the office of chaplain to Lincoln's Inn, whither his sermons attract large numbers of hearers; and he has recently (1860) been appointed by the queen incumbent of the district church of Vere st., Marylebone. His latest publications are a reply to Mansel's Bampton lectures (1859) and "Parochial Sermons" (6 vols. 8vo., London, 1860).

MAURICE, THOMAS, an English clergyman and author, born in Hertford about 1755, died in London, March 30, 1824. He was graduated at Oxford, ordained, and appointed curate of Woodford in Essex. During the early part of his career at the university he had produced a metrical translation of the *Œdipus Tyrannus* and several original poems; but having subsequently become a pupil of Mr. Scott (afterward Lord Stowell), he imbibed from his preceptor a strong predilection for historical research. In 1785 he resigned the curacy of Woodford, and accepted a small pastorate at Epping for the sake of greater leisure. In 1799 he received the appointment of assistant librarian to the British museum. His principal works are: "Indian Antiquities" (7 vols. 8vo., London, 1791-'7); "History of Hindostan" (8 vols. 4to., 1795-'9); "Modern History of India" (2 vols., 1802-'4); and "Memoirs" (3 vols., 1820-'2).

MAURICIUS, FLAVIUS TIBERIUS, a Byzantine emperor, born in Arabissus, Cappadocia, about 539, assassinated Nov. 27, 602. Descended from an ancient Roman family, he passed his youth in the camp and at the court of Justin II., and on the accession of Tiberius in 578 was appointed to conduct the war against the Persians. In 580 and 581 he totally overthrew the Persians in two pitched battles, and returned to Constantinople in triumph. On the death of Tiberius in 582, after proposing Mauricius for his successor, the latter ascended the throne amid universal rejoicing. The Persians immediately renewed the war, and twice defeated the Byzantine commander-in-chief on their borders. Mauricius sent out his brother-in-law Philippicus, who gained a great victory at Solacon in 586, and soon after suffered a total defeat in Arzanene. Philippicus was deposed, but contrived to raise a mutiny, by which he regained the command only to give new proof of his incompetency; he was again deposed, and Heraclius retrieved the Roman fortunes by the victory of Sisarbene and by the recapture of Acbas. The war which succeeded between the Turks and Persians gave relief to the Roman arms. The Persian king

Chosroes II., being driven into exile, took refuge in the Roman territory, and wrote a letter to Mauricius imploring aid. The emperor gave him a large sum of money, and sent a powerful army under the command of Narses for the invasion of Persia. The Persian rebel Bahram was decisively defeated at Balarath, Chosroes was restored to his throne (591), and from this time till the death of Mauricius there was peace between Persia and the empire. The war with the Avars succeeded, which first broke out in 587. After one defeat the barbarians refrained from any incursion for 5 years. When they again threatened the empire, Mauricius intended to put himself at the head of the army; but it was already the Byzantine custom for the emperor not to command in the field, and yielding to the remonstrances of the senate, he sent Priscus as a substitute. He was unsuccessful, and was superseded by the emperor's brother Peter, and the latter soon after by Comneniolus, who suffered a disastrous defeat, in which 12,000 Romans were made prisoners by the Avars, and engaged in treacherous intrigues, when the fortune of the war was restored in 5 successive battles by Priscus, who was again placed in command. In 602 he was ordered by Mauricius to pass to the northern side of the Danube into the Avarian territory. The troops, already alienated, were prepared for mutiny. The emperor had allowed the prisoners taken by the Avars to be put to death rather than to ransom them, the reason probably being that they were the mutinous and dangerous soldiers of Comneniolus. The troops of Priscus now complained that they were destined to destruction like the 12,000 prisoners, organized a rebellion, made Phocas commander-in-chief, and marched toward Constantinople; and while an insurrection arose in the city, Mauricius escaped with his family by sea, took refuge in the church of St. Autonomus, near Chalcedon, and despatched his son to Chosroes to ask him in turn for aid in the recovery of his throne. The emissaries of Phocas, who had been proclaimed emperor, found him in the sanctuary, and dragged him thence to the scaffold. Five of his sons were executed with him, his eldest son Theodosius soon after, and the empress and 8 of her daughters were imprisoned and afterward put to death. He was distinguished for habits of self-control, affection, and piety. He strictly enforced beneficial laws, protected art and learning, and wrote a treatise on the military art which still exists.

MAURITANIA, or MAURETANIA, in ancient geography, the N. W. coast of Africa, including the modern Morocco and part of Algeria. It was bounded N. by the Mediterranean, E. by the river Ampsaga, which separated it from Numidia, S. by the Atlas mountains, and W. by the Atlantic. This region from the earliest times was inhabited by a people whom the ancients called Mauri (Moors), that is, blacks or negroes, who were of Numidian race, and were divided into many tribes. They first became known to the Romans when the latter in

their contests with the Carthaginians had carried the war into Africa. In the Jugurthine war Bocchus, king of Mauritania, was conspicuous, and his sons Bogudes and Bocchus were confirmed as joint kings of the country by Julius Cæsar in 49 B. C. In A. D. 42 the Romans divided the kingdom into two provinces separated from each other by the river Malva or Malucha; the western province was called Mauritania Tingitana, and the eastern Mauritania Cæsariensis. The Romans founded in these provinces 21 considerable colonies, and introduced into the population a large element of Italian origin. In 429 the Vandals, led by Genseric, conquered Mauritania; but in 534 it was reconquered by Belisarius, and remained a province of the empire till it was overrun and subdued by the Mohammedan Arabs in the latter part of the 7th century. (See MOORS, and MOROCCO.)

MAURITIUS, or ISLE OF FRANCE, an island belonging to England, in the Indian ocean, between lat. $19^{\circ} 58'$ and $20^{\circ} 32'$ S., and long. $57^{\circ} 17'$ and $57^{\circ} 46'$ E., about 480 m. E. from Madagascar, 90 m. N. E. from Réunion, and 2,327 m. from the Cape of Good Hope; length N. and S. 86 m., breadth 82 m.; area, 676 sq. m.; pop. in 1856, 238,863, about $\frac{2}{3}$ of whom were males. The island is divided into 11 districts, named Poudre d'Or, Pamplemousses, Flacq, Rivière du Rempart, Trois Îlots, Grand Port, Savane, Quartier Militaire, Moka, Plaines Wilhems, and Plaines St. Pierre. There are several straggling villages and military posts throughout the island, but the only towns of any importance are Mahébourg and Port Louis, the latter of which is the capital and the port from which all the foreign trade is carried on. The population is made up of various Asiatic, African, and European races, and of every conceivable admixture of them all. It is rapidly increasing by the immigration of laborers from Hindostan.—There are numerous capes and bays along the shore, and the island is encircled by coral reefs at various distances, but generally parallel to the land. In these reefs there are 11 passes, by the greater number of which vessels of considerable tonnage may enter and find good anchorage within. The rivers of the island are of little importance; in the rainy season they are swollen into torrents, while in the dry they are little more than brooks. One of the natural curiosities is the lake called Mare aux Vaconas, or Vaquots, named from the vaquois or screw pine (*pandanus utilis*), which abounds in the district, and with which it is encircled. Many streams flow into it; it is more than a mile in length, and in some places 25 fathoms deep, and is well stocked with crawfish, prawns, eels of enormous size, and a small red fish originally brought from China. There are two other smaller lakes near the centre of the island. Mauritius is exceedingly picturesque in appearance, and is thought by some to surpass even Tahiti in this respect. The island is intersected by 8 principal chains of mountains with spurs radiating to the coast. These mountains vary

from 1,800 to 2,800 feet above the sea, are well wooded, and many of them of very singular form. The most remarkable is Peterbote, 2,520 feet high, terminated by a spire of naked rock, on the top of which rests an immense mass of stone, larger than the point on which it is balanced. The summit of another, called the Pouce from its resemblance to the human thumb, is 2,484 feet high. There are many curious caverns, of considerable extent, in some of the ranges. In the centre of the island, on an elevated plateau, there is a mountain of a sugar loaf form called Piton du Milieu. The land rises gradually from the shore to the interior, and the N. end is more elevated than the S. The island presents numerous appearances of volcanic origin, and it has been conjectured that the principal crater must have been in the centre, the dome of which having fallen in, the Piton was thrown up by the last exertion of subterraneous force. The rocks rise in strata from the shore to the centre of the island, upon which there are many mountains composed of ferruginous rocks and grayish lava. Rich iron ore is very abundant, and at one time the mines were extensively worked.—The heat of the weather upon the coasts from November to April is very great, but in the central or elevated parts of the island it is much more moderate. In the interior the mean height of the thermometer in the middle of winter, July, was 67° , and in February, the middle of summer, 76° ; but at Port Louis it averages from 7° to 10° higher throughout the year. The windward side of the island, in the neighborhood of Mahébourg, has a lower temperature by several degrees than the leeward about Port Louis, owing to the cooling influence of the S. E. trade wind. The average annual fall of rain at Port Louis is 89.25 inches. The rainy season is from January to April, but showers are frequent at all times, particularly in the interior. Between December and March the island is subject to hurricanes, for which its neighborhood is famous. In 1778, during one of these storms, the church and about 800 houses were destroyed at Port Louis; and on the opposite side of the island the sea rose 45 feet. In Feb. and March, 1817, two hurricanes did immense damage to the plantations and shipping, and caused the loss of many lives. Some years ago a small house upon Signal mountain, inhabited by two men whose business was to attend to the signals, was blown into the sea, about a mile distant, by a violent hurricane, and neither the men nor a vestige of the house were ever seen again. To guard against a repetition of this misfortune, a residence for the men on the lookout for shipping has been excavated in the solid rock, and a roof attached by strong iron chains. The mortality among the troops is very little greater than that of Europe, and does not much exceed 8 per cent. per annum.—The chief production is sugar; coffee and rice are grown, but in small quantities, not sufficient for the consumption of the colony. Indigo, cotton, and spices

have been successfully cultivated. The native timber is of excellent quality and considerable variety, including ebony, oak, ironwood, and a kind of pine. The indigenous fruits are of little value, and are chiefly those of the ebony and palmists; but guavas, 18 kinds of bananas, peaches, pineapples, mulberries, and strawberries are raised on most of the plantations. The government botanical gardens at Pamplemousses, established by M. Poivre, the governor, about 80 years ago, are remarkable for their varied productions, and contain the richest and rarest plants of the East. Deer and wild hogs and goats are abundant in the mountains, and short-legged hares are numerous in the plains. Apes are to be found in the forests, and are frequently used as food by the negroes. There are great numbers of rats, which prove exceedingly destructive, and mice are common. The birds of the island are not numerous, and are mostly of the smaller tribes. The only bird of prey is a species of hawk. There are partridges, wood pigeons, and doves, and in the marshy spots a kind of water hen. The dodo formerly inhabited Mauritius and the neighboring island of Réunion. The martin was introduced from Asia for the purpose of checking the increase of insects, which it has completely effected. There is still, however, a considerable variety of beautiful insects on the island, butterflies, caterpillars, moths, great numbers of grasshoppers, wasps, and wild bees. A most destructive insect, called the *kakerlac* (*blatta Americana ferruginea*) is one of the greatest pests of the island, attacking every kind of substance, leather, binding of books, and provisions. Ants infest every place, and one kind occasions great damage to trees and wood work. There are no serpents, nor any venomous insects, except a small species of scorpion and centipede. The fish on the coast are abundant and excellent; and there is a great variety of crabs and mollusks. The lobster attains a prodigious size. The sea slug so highly esteemed in China is found within the reefs. Horses, mules, donkeys, horned cattle, sheep, and hogs are imported. In 1854 the live stock of the island consisted of 12,389 horses and mules, 12,907 horned cattle, and 17,076 sheep and goats.—About one third of the entire population are employed in agriculture, and about 8 percent. in manufactures. From the great and unnatural disproportion of the sexes, the annual number of deaths greatly exceeds that of births; and it is recorded as a singular fact that while, as in other parts of the world, among the white inhabitants the number of boys born in a year is greater than that of girls, among the blacks the number of girls is greater than that of boys. Several thousands of Indian immigrants have permanently settled upon the island, who follow various occupations and cultivate land upon a small scale on their own account. The sugar estates are worked entirely by these people; and the satisfactory accounts of their treatment, and the considerable amount of savings taken back to their native villages by those who re-

turn to Hindostan, render the emigration to Mauritius so popular that there is no difficulty experienced in procuring any required number. On Jan. 1, 1858, the Indian population was 120,884 males and 48,670 females. During the year 1859, 44,897 Indian immigrants arrived at Mauritius, 12,754 of whom were women, or a proportion of 40.31 per cent., showing a marked improvement on the disparity of the sexes in the arrivals of former years. The other great branch of the population of the island, the liberated negroes and their descendants, looking upon plantation labor as degrading, and upon themselves as a superior race to the Asiatics, have turned their attention to raising supplies upon their own account for the markets, and to petty traffic of various sorts. In 1854 there were 167,989 acres under crops, and 54,390 uncultivated. With a view to improving the culture of the cane, an agricultural society was formed in 1853 by the principal planters. The surface of the ground being to a great extent covered with stones, renders the use of the plough impracticable, and cultivation is chiefly carried on by the hoe. Guano is extensively used as a manure, and 25,707 tons were imported within the year 1856. The fertilizing power of this manure in the production of sugar is said to be almost fabulous, converting, as if by magic, sterile wastes into luxuriant plantations. In 1845 the entire crop was 102,168,000 lbs.; and in 1855 it had reached 228,480,000 lbs., and is still steadily increasing. During the year ending Sept. 30, 1859, the exports of sugar amounted to 218,945,648 lbs., viz.: to Great Britain, 122,767,825; France, 42,554,788; Australia, 39,419,181; Cape of Good Hope, 9,887,197; other places, 4,816,702. The total crop showed an increase of about 9,000,000 lbs. over that of the previous year. The other exports, beside sugar, are trifling, and with the exception of between 1,000 and 2,000 lbs. of tortoise shell are not worth notice. The value of the produce imported into Great Britain from Mauritius in 1856 is officially stated to have been \$12,135,035. Mauritius is entirely dependent upon imported provisions, and has seldom more than a month's supply in store. In 1856 there were imported 7,817 oxen for the butchers, 53,731 tons of rice, 31,067 quarters of wheat, 9,754 tons of other grain, and 90 tons of salt meat. Grain of all descriptions and various manufactured articles come from India; cattle from Madagascar; horses, cattle, oats, and hay from the Cape of Good Hope; ponies from the Indian archipelago; donkeys from Muscat and the Red sea; mules from France and Spain; sheep from India and Africa; machinery, and almost every article used by a civilized community, from Europe and America. In the year ending Sept. 30, 1859, 797 ships arrived, of which 494 were British, 234 French, and 49 American; value of imports, \$14,956,872. A regular trade has commenced between this island and New York and Boston, and there is now a considerable consumption of American butter, cheese, preserved

meats and fruits, flour, naval stores, timber, &c.; and the traffic is constantly increasing.—The main roads of the island are good, but the by-roads are not in a satisfactory condition. Railroads have been projected, but not yet constructed. A new road has been lately made from Mahebourg which shortens the distance between that town and the capital some 5 or 6 miles, and opens up large tracts of virgin land hitherto untilled and inaccessible.—There is at Port Louis a convent with a large boarding school attached for young ladies. There is also a royal college attended on an average by nearly 800 scholars, which is supported partly by a grant from government and partly by fees paid by the pupils. In 1857 the annual grant for schools, exclusive of the royal college grant, was \$35,080. There are 1,860 scholars at the government schools; 2,285 at private schools; 89 at the school of the Christian knowledge society; and 908 at the Roman Catholic schools. The religious condition of the colony is not favorably reported upon by the Protestant bishop. There are but 6 clergymen of the established church of England, and two others of Protestant denominations; while the Roman Catholic church has a bishop and 18 priests. The whole of them are paid out of the colonial treasury. Several newspapers are published at Port Louis. Monthly communication is maintained with the rest of the world by the Australian line of mail steamers, which touch here once a month, each way, on their route to and from the Red sea.—The government of the island is vested in a governor aided by an executive council, of which the colonial secretary, advocate-general, and the second officer in command of the troops, are *ex officio* members. There is also a legislative council, consisting of 7 official and 7 non-official members; the former comprise the 8 executive members above spoken of, and the collector of customs, auditor-general, treasurer, and collector of internal revenues; the 7 non-official members are chosen from the chief landed proprietors of the island, and submitted to the sovereign of England in council for approval and confirmation. When Mauritius capitulated to the British it was stipulated that the inhabitants should preserve their religion, laws, and customs; and by virtue of this provision their codes, with slight alterations, have since been recognized on the island. There is a supreme court of civil and criminal justice, presided over by 8 judges. There is also a petty court, from which there is no appeal, for the trial of trivial crimes and offences. The revenue of the island in 1857 was \$2,256,045, which slightly exceeded the expenditures. With the exception of part of the governor's salary, and some of the expenditure for a military force (which in 1857 cost the British exchequer £74,881), the island is self-supporting.—The island of Rodrigue, the Seychelles islands, Diego Garcia, and several smaller, are dependencies of Mauritius. Rodrigue is about 300 m. to the eastward, in lat. 19° 18' S. It is 26 m. long by 12 broad, and is composed of hills,

with intervening valleys covered to a great extent with rocks and stones. The soil, however, is exceedingly fertile and productive, and the climate healthy. There is an abundance of fish around the island, but some of them are poisonous at certain seasons of the year. Several colonists from Mauritius have settled here. The Seychelles, or Mahé islands, are between lat. 4° and 5° S. When Mauritius was taken possession of by the British, this group fell into their hands along with it. Beside a number of smaller ones, the chief of the Seychelle islands are Mahé, Praslin, Silhouette, La Digue, and Curieuse, and the area of the whole group is about 50,000 acres. More than half of this area is included in Mahé, which is 16 m. long and from 8 to 5 wide, with a very steep and rugged granite mountain running through the centre. The vegetation of this island, as well as of many others of the group, is exceedingly luxuriant; and among the productions are various spices. The town of Mahé is situated on the N. side of the island; pop. estimated at about 7,000. These islands are a favorite resort for whaling vessels; all have abundance of excellent water. The most remarkable production is the *coco de mer*, so called because the nuts, weighing some 20 lbs. each, were found on the coast of Malabar long before the place of their growth was known. Tortoise shell is procured in considerable quantities. Storms are unknown; and notwithstanding their nearness to the equator the climate is agreeable, the heat being tempered by the sea breezes. Diego Garcia lies about 4° further E., and is a low coral island. It abounds with turtle, and has a few residents from Mauritius.—Mauritius was discovered by the Portuguese in 1507, who called it *Ilha do Cerne*, supposing it to be the *Cerne* of Ptolemy. They landed deer, goats, monkeys, and pigs, and kept nominal possession of it till near the end of that century. In 1598 part of a Dutch squadron, while on a voyage to Batavia, accidentally fell in with the island, which they knew only by name. Upon landing they found it thickly covered with forest trees and a most luxuriant vegetation, with an abundance of water and an astonishing number of birds. The commander changed the name of the island from Cerne to Mauritius, in honor of Prince Maurice; he did not leave any colony, but planted some seeds. The first Dutch settlement was made in 1644, but it was afterward abandoned; they again settled upon the island, and made it a penal establishment for criminals from their Indian possessions, but finally withdrew to the Cape of Good Hope in 1710. The French took possession of Mauritius in 1715, and called it *Ile de France*. The first regular settlement took place in 1735 under M. de Labourdonnais, who introduced the cultivation of the sugar cane, indigo, and manioc, which he had himself brought from Brazil. He changed the port from the E. side of the island to what is now the city of Port Louis, built forts, hospitals, barracks, mills, and quays, and made roads. He returned to France,

and came back to Mauritius in 1745; and it was during his second administration that the ship *St. Geran* was wrecked, in which was lost the young lady whose story was the basis of St. Pierre's tale of *Paul and Virginia*. M. de La-bourdonnaie, upon his second return to his native land, was imprisoned in the Bastille, where after remaining 8 years he was acquitted and thrown penniless on the world. He survived this ungrateful treatment about 8 years. Many troubles now visited Mauritius—hurricanes, locusts, and sickness. The English sent an expedition from India to take it; but having on the way stopped at the island of Rodrigue, the soldiers ate of the fish and were poisoned, and the expedition was abandoned. The isle of France was a source of great mischief for a long time during war to the merchant vessels of England. Its position afforded great facility for the French men-of-war and privateers to intercept the Indian bound to and from the ports of Hindostan. After a fruitless attempt to capture the island in 1809, the British fitted out a formidable expedition from India the year following, which proved completely successful. Port Louis, and with it the whole island and its dependencies, capitulated upon very honorable terms; the French code of laws was retained, and the garrison was sent to France with arms and equipments. At the peace of 1814 the English possession of the island was ratified, and Mauritius has since continued to be a portion of the British dominions. The subject of introducing immigrants from India was first discussed in 1834, and 75 came in that year to the island. In 1835 the emancipation act of the British parliament, passed Aug. 28, 1833, came into operation, and slavery ceased to exist in Mauritius.

MAURY, a central co. of Tenn., intersected by Duck river, by which and its tributaries it is drained; area, 570 sq. m.; pop. in 1850, 29,520, of whom 12,670 were slaves. It has a diversified surface, and the soil is fertile, particularly near the streams. The productions in 1850 were 2,016,600 bushels of Indian corn, 185,170 of oats, 74,893 of sweet potatoes, and 167,517 lbs. of tobacco. There were 20 grist mills, 14 saw mills, 10 tanneries, 53 churches, and 2,233 pupils attending schools.

MAURY, JEAN SIFFREIN, a French cardinal and orator, born at Valréas, department of Vaucluse, June 26, 1746, died May 11, 1817. The son of a shoemaker, he early showed remarkable aptitude for learning, and was educated for the priesthood at Avignon. At the age of 20 he went to Paris as *abbé précepteur*, was induced by the favorable reception of several discourses to devote himself to preaching, obtained an *accessit* from the academy for an *éloge* on Fénelon in 1770, and by his panegyrics on St. Louis in 1772 and St. Augustine in 1775 placed himself at the head of the French pulpit orators of the time. He was appointed preacher to the court, succeeded at once in pleasing the believers and the philosophers, and through the influence of the former obtained the abbey of Frénade

and the priory of Lihons, and through that of the latter a seat in the academy. In 1785 he pronounced his masterpiece of religious eloquence, a panegyric on St. Vincent de Paul. At the convocation of the states-general he was chosen to it as a deputy of the clergy, immediately took a leading part in the debates as a defender of the church, aristocracy, and royalty, and was the most daring and powerful antagonist of Mirabeau. Until the flight of Louis XVI. he opposed with preëminent skill and at constant peril, the revolutionary measures, excelling not only in impassioned oratory, but in felicitous bon-mots, and in familiarity with the details of war, commerce, and finance. At the close of the constituent assembly he left France, and was received with a triumph at Rome, where he took up his residence. He was made successively archbishop of Nicæa *in partibus*, nuncio to the diet at Frankfort for the election of emperor, cardinal, and bishop of Montefiascone and Corneto. On the invasion by the French in 1798 he escaped in disguise to Venice, and passed thence to St. Petersburg. Returning in the following year, he was appointed by the count of Provence (Louis XVIII.) his ambassador to the holy see, but subsequently became reconciled to Napoleon, and returned to France in 1806. He was declared a French cardinal, was consulted in ecclesiastical affairs, and elected a member of the institute, but lost the esteem of his former friends. In 1810 he was appointed archbishop of Paris, and his florid episcopal charges were subjects of ridicule, and showed no sign of the resolute energy which had made him formidable in the assembly. When the pope was taken to Savona a captive of Napoleon, he ordered Cardinal Maury to relinquish the administration of his diocese. The latter paid the penalty of his disobedience by a few months' imprisonment at Rome after the restoration, and he afterward lived in retirement. His *Essai sur l'éloquence de la chaire* (2 vols., 1810) is still esteemed.—See Poujoulat, *Le cardinal Maury, sa vie et ses œuvres* (Paris, 1855).

MAURY, LOUIS FERDINAND ALFRED, a French scholar and author, born in Meaux, March 23, 1817. He was prepared to enter the polytechnic school with reference to mathematical pursuits, but his tastes led him to engage in various general studies, and in 1836 he became attached to the royal library, which he quitted in 1838 for greater leisure. Chiefly occupied with archæology and philology, he at the same time studied medicine and was admitted as an advocate. His bibliographical knowledge caused him to be recalled to the royal library in 1840, where he continued for 4 years, when he was elected sub-librarian to the institute. In this office he rendered important services till in 1857 he was elected a member of the academy of inscriptions and belles-lettres. In the previous year he was made a chevalier of the legion of honor. His principal publications are: *Essai sur les légendes pieuses du moyen âge* (Paris, 1843); *Les fées du moyen âge* (1855); *Histoire*

des grandes forêts de la France (1856); *La terre et l'homme* (1856), a summary of recent geographical, ethnological, and philological researches; and *Histoire des religions de la Grèce antique* (1857 et seq.). He has also written a large number of articles in periodicals, and in the transactions of learned societies.

MAURY, MATTHEW FONTAINE, LL.D., an American naval officer, astronomer, and hydrographer, born in Spottsylvania co., Va., Jan. 14, 1806. His parents removed while he was still young to Tennessee. In 1825 he entered the naval service as midshipman, and was appointed to the *Brandywine*, then fitting out to convey Gen. Lafayette to France. He returned with this vessel in the following year, and made a voyage in her to the Pacific, where he was transferred to the sloop of war *Vincennes*, in which he circumnavigated the globe. During this cruise, which occupied about 4 years, and while yet a passed midshipman, he began his "Treatise on Navigation," which has passed through several editions, and is used as a text book in the navy. He was again sent to the Pacific as master of the *Falmouth*, and when that vessel was about to return to the United States was transferred to the frigate *Potomac* as acting lieutenant. In 1836 he was regularly promoted to a lieutenantcy, and received the appointment of astronomer to the South sea exploring expedition, but resigned it. In 1839, while traveling on professional duty, he met with an accident which resulted in permanent lameness and unfitted him for active service afloat. He was now placed in charge of the depot of charts and instruments at Washington, afterward known as the hydrographical office; and upon the organization and union with it of the national (now called the naval) observatory in 1844, he was made superintendent of the combined institutions. Before this time, however, Lieut. Maury had begun a series of investigations in what Humboldt has called the "physical geography of the sea," and had gathered many observations of the ocean winds and currents from the records of naval and merchant vessels. Commencing with such log books as could be collected here and there, the experience of each route as to winds, currents, &c., was carefully marked down with appropriate symbols; and afterward, as sufficient materials were obtained, the results of these mappings were reduced to numbers, a bare inspection of the symbol-covered chart being generally sufficient to indicate the proper direction for the subsequent investigation. These results were made the basis of study with the view of directing further observations. In some cases, where data were scanty or entirely wanting, special cruises have since been made to fill the vacancies, until material was collected for a systematic study of the actual course of winds and currents. In 1842 he communicated to the bureau of ordnance and hydrography a plan for supplying model log books to the commanders of vessels in the naval and merchant marines, in

which a systematic series of observations might be recorded, and for causing abstracts of these records to be returned to the department. The scheme was adopted, and in the course of 8 or 9 years he had thus collected a sufficient number of logs to make 200 large manuscript volumes, averaging each from 2,000 to 3,000 days' observations. These materials were digested and examined by a staff of officers appointed for the purpose. In 1844 Lieut. Maury made known his conclusions respecting the Gulf stream, ocean currents, and great circle sailing, in a paper read before the national institute, and printed in the "Southern Literary Messenger" for July of that year, under the title of "A Scheme for Rebuilding Southern Commerce." With the accumulation of material for his investigations, the need was felt of systematizing the observations and records themselves, particularly as ships of different nations used different methods of observation and registry. Lieut. Maury accordingly entered with zeal into a project for assembling a general maritime conference, which at the suggestion of the United States government met in Brussels in 1853, and recommended a form of abstract log to be kept on board ships of war and merchant vessels, in which a condensed and uniform statement is given of all important and noticeable facts in meteorology or the general history of winds and waves during the voyage. Cordial cooperation was obtained from the British government, the royal society of London, and the British association. The principal results of Maury's researches are embodied in the wind and current charts and the sailing directions published by the observatory for general distribution among navigators, and in more popular style in the "Physical Geography of the Sea" (New York, 1856). The charts, consisting of several independent series, as the track, pilot, storm, thermal, and whale charts, are ingeniously constructed so as to present upon simple inspection, and for every part of the ocean, the results of all previous experience there, whether of winds, storms, rain, or any other possible phenomena. Each square of 5° contains the meteorological and other history of the locality clearly expressed to the eye. In the sailing directions, the lessons deduced from the charts are expressed in numbers, giving for every great thoroughfare guides indicating the shortest and best routes. But beside these practical results there are also given here, and in the smaller work mentioned above, many theoretical investigations respecting the general course and laws of the winds and principal currents of the sea. Thus the new theory, originating with Maury, of the crossing of the trade winds at the equator, whereby the excess of evaporation in the southern hemisphere is made to supply the greater requirements of precipitation upon the dry land of the northern, is fully developed and discussed. Among the practical commercial results of these explorations are claimed to be the shortening of the passage from the Atlantic to the Pacific

ports of the United States by about 40 days, and of voyages from America to Europe in proportion; the discovery of the telegraphic ocean plateau; and the indication of good whaling grounds. In 1855 Lieut. Maury was promoted to the rank of commander. He is a member of many of the principal scientific associations of America and Europe, and has received from several foreign governments valuable testimonials of their appreciation of his services. Beside the works already mentioned, he has published "Letters on the Amazon and the Atlantic Slopes of South America;" "Relation between Magnetism and the Circulation of the Atmosphere," in the appendix to "Washington Astronomical Observations for 1846" (1851); "Astronomical Observations" (1853); and "Letters concerning Lanes for the Steamers crossing the Atlantic" (1854).

MAUVE (Fr., purple mallow), one of the new dyeing materials obtained by the oxidation of aniline, a product of coal tar. It was first extracted by Mr. Perkins of England, who gave it this name; but the substance may possibly prove to be the pittacal of Von Reichenbach. It is prepared by dissolving equivalent proportions of sulphate of aniline and bichromate of potash in water, mixing and allowing them to stand some hours. A black precipitate, obtained on filtering, is washed, dried, and digested in coal tar naphtha to extract a brown, resinous substance. The coloring matter is then extracted by digestion in alcohol, and is obtained on distilling off the spirit in a coppery friable mass; or it may be kept in a liquid state in alcohol. The colors it gives are a variety of shades of purple, the blue predominating in some, and the red in others. The dye is especially valuable for the permanence of the colors, the purples obtained from other sources being for the most part fugitive.

MAVROCORDATO, or **MAUROCORDATOS**, a Greek statesman, born in Constantinople about 1790. Both by his father and mother, who on the outbreak of the Greek revolution became victims of the infuriated Moslems of the Turkish capital, he belonged to distinguished families, several members of which, at various periods, officiated as hospodars of Moldavia or Wallachia. He received an education befitting his connections, early developed a remarkable linguistic talent, which eventually enabled him to acquire a knowledge, beside the Greek, of the Turkish, Persian, French, Italian, English, and German languages; and in 1817 he became secretary of his uncle Caradja, hospodar of Wallachia. While acting in this capacity, he joined the secret associations which were then preparing the regeneration of Hellas. When his uncle was replaced by Sutzo, he followed him to western Europe, and lived for some time in Switzerland and Italy. Having received the news of the outbreak on the mainland of Greece in 1821, he immediately embarked to join the insurrection,

accompanied by a number of French and Italian volunteers. On his arrival in the Peloponnesus he was despatched to Ætolia, where he organized a provisional government for western Greece. He exerted himself to bring about a union of the chiefs, and when Demetrius Ypsilante withdrew from the national assembly he was elected its president, and intrusted with the elaboration of the declaration of independence (Jan. 1822). He was soon after elected *proedros* or president of the executive committee, Negris becoming secretary of state, and personally took the command in western Greece. In Missolonghi, by the gallant defence of which in 1823 he saved the Peloponnesus, he made the acquaintance and gained the friendship of Byron. Persecuted by the partisans of Demetrius Ypsilante and Colocotronis, he left Missolonghi, and after some time withdrew to Hydra, where he prevailed upon the navarchs to sail to the relief of Missolonghi. Having once more acted for some time as president of the government, he again took the field in 1824, successfully opposed the progress of Omer Vrioune, and subsequently distinguished himself by the heroic defence of Navarino and Sphacteria. The intrigues of the Russian party, the principal representative of which was Colocotronis, greatly checking his activity, he gradually withdrew from public service, without neglecting however to aid the provisional government by his numerous Philhellenic connections. In England, especially, toward which he showed a persistent leaning, his influence was often of high importance. During the latter years of the presidency of Capo d'Istria, he became one of the most violent denouncers of the Russian tendencies of the government, joined the opposition movements of Miaoulis, and, when the latter finally committed open acts of rebellion, was declared a traitor (1831). After the assassination of Capo d'Istria, he also opposed the measures of his brother and successor in office, Augustine. The election of the Bavarian prince Otho as king in 1832 put an end for a time to this strife of the various factions, and in the following year Mavrocordato entered the royal cabinet. The numberless difficulties of the new government, however, and particularly the dissensions which broke out between the president and various members of the Bavarian regency, compelled him to retire from the ministry in June, 1834, and he now served for a number of years as ambassador to the courts of Munich, Berlin, and London. The Turkish-Egyptian war of 1840 bringing about serious complications with the allied European powers, which had guaranteed the integrity of the Porte, while Greece was all in a ferment to take advantage of the prostrate state of her enemy, King Otho saw himself obliged to call Mavrocordato to the presidency of the ministry, with the portfolio of home affairs (July, 1841). This career was of very short duration, the English connections of Mavrocordato exposing him to the combined attacks of the native as well as foreign representatives of all other interests.

He was sent to Constantinople to conciliate the Porte. The revolution of Sept. 15, 1848, which annihilated the influence of the Bavarian companions of the king, recalled Mavrocordato from Constantinople. Together with Metaxas, the leader of the Russian, and Colettis, the leader of the so called national or French party, he entered the new cabinet; and when both these colleagues left it, he concentrated almost all power in his hands, and became minister president of a new cabinet in April, 1844. He had in the mean time been active, as a representative in the national assembly, during the debates on the constitution, displaying a remarkable ability as an orator. The state of the kingdom, however, was almost desperate. The finances were entirely exhausted, Russia and other powers were hostile and engaged in intrigues, the factions more violently opposed to each other than ever, and the royal troops unable to check the depredations of the Klephts, and still more the insurrections which followed each other. That of Grivas in Arta could be checked only by an operation which was stigmatized as treachery. The hostility of the press provoked measures in the highest degree unpopular. Other acts of the ministry betrayed a very dangerous party spirit. It finally succumbed, in Aug. 1844, to a general outcry of indignation, and was succeeded by a ministry under Colettis, consisting of a coalition of the national and Russian parties. The new assembly was animated by a spirit of the most decided hostility to the partisans of England, and Mavrocordato with a number of colleagues was ejected. He continued an opponent of Colettis till the death of the latter in 1847, as well as of his successor, but in 1850 accepted the Paris embassy. The open hostility both of the king and the people to the Porte during the Russian war having caused the occupation of the Piræus by the fleet of the allies, and brought Greece upon the brink of ruin, Mavrocordato was recalled by the king, and was again placed (May, 1854) at the head of the cabinet, which he soon after left with some of his colleagues, being dissatisfied with the influence of the court. Although nearly blind, he still continues (Aug. 1860) actively engaged in the cause of education at Athens.

MAXCY, JONATHAN, D.D., an American clergyman, born in Attleborough, Mass., Sept. 8, 1768, died in Columbia, S. O., June 4, 1820. Evincing in his youth considerable intellectual precocity, he was sent at 15 years of age to Brown university, where he was graduated in 1787. The college faculty immediately appointed him to a tutorship, an office which he held for 4 years. In the mean time he studied divinity, and in April, 1790, was licensed as a preacher in the Baptist church. In Sept. 1791, he was instituted pastor of the first Baptist church of Providence, and at the same time was elected a trustee and professor of divinity in Brown university; and in the succeeding September, although but 24 years of age, he was called to the presidency of that institution.

After filling this position 10 years, he was elected in 1802 president of Union college, N. Y., whence 2 years later he went to Columbia, S. O., to accept the presidency of the South Carolina college. This latter station he occupied until his death. He was an eloquent preacher, and well versed in philology, criticism, and moral philosophy. A number of his sermons, including one on "The Existence of God demonstrated from the Works of Creation," with other literary remains, were published in 1844, preceded by a life, by Romeo Elton, D.D.

MAXIMIANUS I. See DIOCLETIAN.

MAXIMIANUS II. See GALERUS.

MAXIMILIAN I., emperor of Germany, born at Neustadt, near Vienna, March 22, 1459, died in Wels, Jan. 12, 1519. He was the son of the emperor Frederic III., of the house of Hapsburg, and of Eleanor, a princess of Portugal. He learned to speak a number of languages, acquired various branches of knowledge, and, spending his youth in the wars of his father with Podiebrad of Bohemia, Matthias Corvinus of Hungary, and others, became an excellent horseman, tilter, and hunter, gallant, chivalric, and adventurous. His fine and stately personal appearance, which in some features reminded one of his ancestor Rudolph of Hapsburg, also advantageously distinguished him from his slothful father. The latter, faithful to the maxim of his house to conquer by marriages, sought for him the hand of Mary, the daughter and heiress apparent of Charles the Bold of Burgundy, promising a royal crown to the duke. The parties and their parents met at Treves in 1478; but the mutual distrust of the latter respecting the fulfilment of the conditions broke off the negotiations. When 4 years later Charles perished on his flight from the battle field of Nancy, his widow Margaret rejected the offers of Louis XI. of France in behalf of his infant son Charles (afterward VIII.), telling his barber and envoy Oliver that Maria was to be married to a man, with whom she hoped to have children of her own. Soon afterward the rich and beautiful heiress became the wife of Maximilian, and in a few years the mother of two children, Philip and Margaret. But her husband neither succeeded in saving all her possessions from the rapacity of Louis XI., nor in obtaining the ready allegiance of the rich cities of the Netherlands, when on her sudden death, in 1482, caused by a fall from her horse while hunting, he claimed the regency for his son Philip. Louis was active in instigating and promoting revolts in those provinces, and Maximilian suffered still greater injury from France a few years later, when, after his election and coronation as king of the Romans (1486), having married by proxy another rich heiress, Anne of Brittany, and promised his own daughter Margaret to Charles VIII., Anne de Beaujeu, the regent of the latter, suddenly broke off both engagements, bringing Brittany with Anne into the hands of Charles, and sending back Margaret to her father. The war which ensued was of

short duration. Maximilian now married Bianca Sforza, the daughter of the murdered duke of Milan, Galeazzo Maria, receiving 300,000 ducats from her uncle and guardian, the bloody Ladovico Moro, on whom he bestowed Milan, the heritage of the brother of his bride. The wife of the lawful heir, however, a Neapolitan princess, sought for aid from her native country, and the usurper Moro thereupon prevailed on the king of France to renew the old claims of the house of Anjou to Naples, and to enter on an Italian campaign. This led to those long Italian wars, in which during Maximilian's lifetime Charles VIII., Louis XII., and Francis I. of France, Ferdinand the Catholic of Spain, the popes Alexander VI. and Julius II., the empire, Switzerland, the republic of Venice, and Naples were principally engaged. Campaigns, treaties of peace, alliances, and treacherous desertions of allies followed in rapid succession; but the details belong to the history of the more important actors, Maximilian, who in 1493 had succeeded his father as emperor, playing in the whole a secondary part, so far inadequate to his adventurous and often chimerical schemes were the meagre supplies which he was able to extort in numerous diets from the unwilling states. One of these plans was that of becoming pope after the death of Julius II. Instead of aiding their emperor, the states of Germany were always ready to complain, and the empire itself was not a little distracted by feuds, in spite of the eternal peace decreed by the diet of Worms in 1495, of the new *Reichskammergericht*, and the exertions of the Swabian confederacy for the maintenance of order. Switzerland, which was to be reconquered, now entirely detached itself from the Germanic body, whose head saw himself often deserted by his allies, sometimes by his own troops, and frequently penniless. The troubles of the reformation broke out shortly before his death. In the mean time he had not neglected to continue the safer and peaceful conquests of his house. Philip and Margaret, his only two children by Mary of Burgundy, married Juana and Juan, the children of Ferdinand of Aragon and Isabella of Castile; Philip succeeded to the throne of Castile in 1503, and died in 1506; and his son Charles, on the death of Ferdinand in 1516, inherited the whole of Spain. This young prince also became the successor of Maximilian as emperor of Germany, under the name of Charles V., his younger brother Ferdinand inheriting the German possessions of Austria, and subsequently, in consequence of other marriage connections, also ascending the thrones of Hungary and Bohemia. Having also succeeded Charles V. in the empire, Ferdinand I. left all his thrones to his good-natured but feeble son Maximilian II. (1564-1576). Maximilian I. left a number of treatises on military science, gardening, the chase, and other subjects, and a poetical work on his own life.

MAXIMINUS, CAIUS JULIUS VERUS, Roman emperor, born in Thrace toward the close of

the 2d century, killed before Aquileia in 238. He was the son of a Goth by an Alan woman, and was brought up as a shepherd. During the passage of the emperor Septimius Severus through Thrace, on his return from the East, he attracted the attention of that monarch by marvellous feats of strength and agility, as well as by his gigantic stature, being upward of 8 feet in height, and eventually able to wear the bracelet of his wife as a ring on his finger. Admitted to the army, though a barbarian, he rose from rank to rank, gained the admiration of his fellow soldiers by valor equalling his strength, and after several reigns succeeded in supplanting the virtuous Alexander Severus, on whose assassination by the soldiers in Gaul he was proclaimed emperor (235). He appointed his son Maximus to the dignity of Cæsar. Though successful in his almost continual wars against the Germans, the imperial barbarian, who is said to have eaten 40 pounds of meat and drunk an *amphora* of wine a day, was tormented by a sense of insecurity, and in order to preserve his power stained his reign with cruelties which surpassed those of his previous masters, Caracalla and Elagabalus. He spared none whom birth or merit exposed to suspicion. In consequence of an alleged conspiracy, Magnus, a senator, with 4,000 others, was put to death. Simple death was regarded as a favor. His rapacity was no less disastrous than his cruelty, and he finally sunk under the general indignation of the provinces aroused by a wholesale confiscation of municipal property for the use of the imperial treasury. The insurrection broke out in Africa, where the two Gordians were proclaimed emperors. These perishing soon after, the senate proclaimed Maximus and Balbinus their successors. Maximinus, who had his winter quarters on the lower Danube, hastened to Italy, crossed the Alps, and besieged Aquileia, but was soon murdered, together with his son, by his own soldiers.

MAY (Lat. *Maius*), the 5th month in the Gregorian calendar, consisting of 31 days. The name is of uncertain origin. Ovid suggests its derivation from either *majestas*, *majores*, or *Maia*, the mother of Mercury; and others think it a Teutonic word. Among the Romans it was sacred to Apollo, and almost every day was a festival. On the 9th, 11th, and 18th days was celebrated the festival of the *lemuria* in memory of the dead, and consequently it was believed that marriages contracted in this month would soon result fatally. Traces of the same superstition still exist, as in the French proverb: *Noces de Mai, nocēs de mort*. From the ancient *Floralia*, or festival in honor of Flora, celebrated from April 28 to May 2, is perhaps derived the mediæval and modern custom of observing May 1 (May-day) with festive and floral rites. The druids also were accustomed to light large fires upon the summits of hills on the eve of May. From the time of Chaucer references to May-day festivities are common in English poetry. In the "Knights Tale," on May morning:

Fourth goeth al the court, both moste and leste,
To fêche the floures freshe, and braunch and blome.

Polydore Vergil says that it was usual to adorn not only houses and gates, but also churches, with boughs and flowers. Hall mentions in his "Chronicle" that Henry VIII. rode a-Maying with Queen Catharine and many lords and ladies from Greenwich to the high ground of Shooter's hill; and he adds that it was customary for the citizens of London to join together and have their several Mayings, with May poles, warlike shows, arches, morris dancers, and other devices. Milton wrote a song on May morning, and Shakespeare and Herrick frequently refer to its observance. Robin Hood and Maid Marian, the queen of the May, are associated with the traditions of May games.

MAY, CAROLINE, an American authoress, is the daughter of the Rev. Edward Harrison May, for many years pastor of one of the Dutch Reformed churches of New York, of which city she is a resident. She has edited "American Female Poets" (1848), with numerous biographical and critical notes; "Treasured Thoughts from Favorite Authors" (12mo., 1851); the "Woodbine" (1852), an annual, &c.; and has produced occasional poems and prose essays.

MAYENNE. I. A N. W. department of France, formed from the old province of Maine, bounded N. by La Manche and Orne, E. by Sarthe, S. by Maine-et-Loire, and W. by Ille-et-Vilaine; area, 1,998 sq. m.; pop. in 1856, 373,841. The surface is rugged and diversified. Iron, coal, and slate are found. The river Mayenne traverses the department from N. to S. The climate is mild and healthful. The soil, except in the S. districts, is not fertile, but the greater part of it is under cultivation. The chief manufactures are linen, canvas, cotton, and paper. The principal towns are Laval, the capital, Mayenne, and Château-Gontier. II. A river of France (anc. *Meduana*), which rises in the department of Orne, and, after a S. course of over 120 m., unites with the Sarthe to form the Maine (7 m. long) near Angers. Its chief tributary is the Varenne. The river is navigable from Laval to the junction of the Maine with the Loire, about 55 m.

MAYER, BRANTZ, an American lawyer and author, born in Baltimore, Md., Sept. 27, 1809. Educated at St. Mary's college, Baltimore, after leaving that institution he sailed for the East, visiting Java, Sumatra, and China, and returned in 1828. He entered on the profession of the law in 1832, practising until 1841, and in that year, having visited Europe meanwhile, was appointed secretary of legation to Mexico, where he remained one year. Since his sojourn there he has devoted some time to literature as well as to his profession, and for a short period edited the "Baltimore American" newspaper. His first book, "Mexico as It Was and as It Is," was published in 1844, and was followed by a more elaborate work, "Mexico—Aztec, Spanish, and

Republican" (2 vols. 8vo., 1851). In 1854 appeared "Captain Canot, or Twenty Years of an African Slaver," written from the notes, journals, and conversations of Canot himself. Mr. Mayer has also written "Observations on Mexican History and Archæology, with a Special Notice of Zapotec Remains, as delineated in Mr. J. G. Sawkins's Drawings of Mitla," &c., published in the Smithsonian "Contributions to Knowledge" (Washington, 1856), and another work on "Mexican Antiquities" (Philadelphia, 1858). His occasional addresses have been numerous, and he has contributed to the Maryland historical society, of which he was corresponding secretary, the "Journal of Charles Carroll of Carrollton during his Mission to Canada," "Tah-gah-jute, or Logan and Captain Michael Cresap," &c.

MAYER, JOHANN TOBIAS, a German astronomer and mathematician, born in Marbach, Wurtemberg, Feb. 17, 1728, died in Göttingen, Feb. 20, 1762. His knowledge of elementary mathematics was derived from his father, a civil engineer; but the rest of his education was self-acquired. He gained a living, when a mere youth, by teaching mathematics. His first scientific production, "A Treatise on Curves for the Construction of Geometrical Problems," appeared in 1745. The university of Göttingen in 1751 chose him its professor of mathematics, and appointed him director of its observatory. His "Zodiacal Catalogue," comprising 998 stars, is of the very highest authority; and his "Lunar Tables," published in 1755, were deemed of such value by the English astronomer royal that the British parliament awarded his widow £3,000. The most important of Mayer's discoveries was the principle of the "repeating circle," employed by Borda in measuring the arc of the meridian.

MAYFLY, an insect generally placed in the order *neuroptera*, with the dragon flies, ephemeræ, myrmeleon, and termites or white ants, forming the genus *phryganea* as restricted by Latreille. The jaws are hardly perceptible; the lower wings are broader than the upper, and longitudinally plaited; they have no sting nor piercer, and the antennæ are as long as the body; they undergo complete transformation, the larvæ and pupæ living in the water and feeding on aquatic insects and plants. The eggs are laid on the leaves of willows and other trees overhanging the water, attached by a viscid matter; the small 6-footed larvæ, when hatched, fall into the water, and there form for themselves cases of bits of straw, wood, leaves, stones, and shells, cemented together by a glutinous silk; they are hence called case or caddis worms; the larva protrudes its head and shoulders from the case when searching for food; the manner in which these cases are made, ballasted, and balanced, affords a striking example of insect architectural ingenuity. (See Rehn's "Insect Architecture.") The pupa is incomplete, and is enclosed in the larva case, at one end of which is a silken grating through which

the water for respiration is admitted and ejected; just before quitting the case the grating is cut through by a pair of curved mandibles, and the insect leaves the water by means of the 4 anterior legs, which are unconfined, to assume the perfect state. The flies as well as the larvæ are greedily eaten by fish, and are well known to anglers, who imitate the perfect insects by colored feathers as bait for trout, grayling, &c. Mayflies fly heavily, and generally alight on bushes near the water's edge; most of them are of a brown color, with cinereous, greenish, and yellowish markings; they include the willow, alder, green tail, and dun flies, which cover the surface of the water during the cloudy days of spring, affording plentiful food for fish; as the season advances they appear chiefly in the morning and evening, and during the heat of summer are principally nocturnal. About 800 species are described, one of the largest of which is the *P. grandis* (Linn.) of Europe, nearly an inch long, with a spread of about 2 inches; the upper wings are brownish gray with cinereous spots, and the antennæ as long as the body. Kirby established the order *trichoptera* for these insects, which present some peculiarities connecting them with *lepidoptera*; the larvæ resemble the moths in making cases; the perfect insects have the wings hairy but scaleless, without reticulations, and the under ones folded longitudinally; the antennæ are like those of moths, and the tibiæ are often armed with the 2 pairs of spurs observable in the latter; but they have not a spiral tongue, and the head has 3 single eyes as well as the usual compound ones; the abdomen is never furnished with terminal setæ. There are some of the *pyralides* or delta moths, in the larva state living in leafy cases under water, and feeding on aquatic plants, which seem to make a transition to the *trichoptera* or this division of the *neuroptera*.—Another neuropterous insect, of the subulicorn family and genus *ephemera* (Linn.), is also called mayfly; the lower wings are much smaller than the upper, and both are carried perpendicularly; the abdomen is terminated by 2 or 3 setæ; the antennæ are short, and the body is soft, long, and tapering. These frail creatures appear in the winged state toward evening in summer, often in immense numbers; the *E. albipennis*, a European species, with white wings, occurs sometimes in such abundance in midsummer as to remind one of a snow storm. The larvæ are aquatic, and excavate burrows in the banks of streams under water, in which they are safe from fishes and yet amply supplied with food; after changing their skins several times they become nymphs, with the long caudal appendages and lateral fringes of the larvæ, but with rudimentary wing cases in addition; after attaining the winged state, they cast off a complete envelope of skin. Passing a year or two in their imperfect condition, they assume their perfect shape and sport for a few days, perhaps for a few hours only, in the summer day or evening.

They are good emblems of the fleeting pleasures and life of man, and have so been frequently employed in verse and prose. Swammerdam, Réaumur, and De Geer have written fully upon their aerial dances in a very interesting manner. The fishermen of France call them *manna* from their furnishing abundant food for fish, covering as they do the surface of the water with their countless swarms in August. (See Rennie's "Insect Transformations.") These are generally called day flies, and are imitated, like the preceding, as baits for river fish.

MAYHEW, the name of several brothers distinguished in contemporary English literature. I. HENRY, born in London, Nov. 25, 1812, was educated at Westminster school, and after a somewhat irregular course of life established himself in London as a literary man. In 1841 he was engaged in founding the comic periodical "Punch" (which was preceded by "Figaro in London," also started by himself), and for some years was its chief editor. A disagreement with the proprietors caused him to retire from this position, and he has since devoted himself to the preparation of original works published under his name. His chief publication is "London Labor and the London Poor" (2 vols. 8vo., 1851), a work commenced in the columns of the London "Morning Chronicle," but left incomplete in consequence of involvement in legal proceedings from causes over which the author had no control. In conjunction with his brothers Horace and Augustus, the former of whom has for many years been attached to the staff of "Punch," he has also aided in the production of a series of humorous novels and Christmas stories by the "Brothers Mayhew," including "The Greatest Plague of Life, or the Adventures of a Lady in Search of a Husband;" "Whom to Marry and How to get Married;" "The Image of his Father;" "The Good Genius that turned Every Thing into Gold;" "The Magic of Kindness," &c. Under his own name he has published two interesting juvenile books, entitled "The Story of the Peasant-Boy Philosopher," founded on the life of James Ferguson, and the "Wonders of Science," founded on that of Sir Humphry Davy. He has also produced an anonymous work, entitled "The Mormons, or Latter-Day Saints, a Contemporary History" (1852). II. EDWARD, born in London in 1813, was during his youth the manager of a strolling company, and in that capacity wrote the farce of "Make your Wills." He has published a valuable manual on the "Management and Treatment of Dogs," "Treatise on the Mouth of the Horse," and the "Illustrated Horse Doctor" (London, 1860). III. THOMAS, born in 1810, was one of the first to prepare cheap publications for the poorer classes, and started a number of "penny dictionaries," "penny grammars," and similar works, forming the "Penny National Library." He was at one time editor of the "Poor Man's Guardian," which during the agitation of the reform bill encountered the opposition of government in consequence of its

radical opinions. IV. HORACE, beside sharing largely in the authorship of the books by the "Brothers Mayhew," has published several humorous works under his own name, including "The Toothache, imagined by Horace Mayhew, and designed by George Cruikshank," "Letters left at the Pastry Cook's," &c. V. AUGUSTUS had an equal share with Horace in the production of the "Brothers Mayhew" series, and has also been an industrious contributor to periodical literature.

MAYHEW, JONATHAN, an American clergyman, born in Martha's Vineyard, Mass., Oct. 8, 1720, died in Boston, July 9, 1766. He was graduated at Harvard college in 1744, and in 1747 was ordained minister of the West church in Boston, a position which he filled during the remainder of his life. He was distinguished as a preacher and a writer of controversial tracts, evincing extensive learning, and an independence of spirit which occasionally betrayed him into indiscretions. Many of his writings were republished in England, and in 1749 he received from the university of Aberdeen the degree of D.D. Among the most prominent acts of his life was his opposition to the proceedings of the British society for the propagation of the gospel in foreign parts, which involved him in a controversy with Dr. Apthorp and other divines of the church of England, including Dr. Secker, the archbishop of Canterbury. On this occasion he opposed with vigor and effect the introduction of bishops into the colonies. He coöperated with Otis and other early opponents of the arbitrary designs of the mother country, occasionally introducing his liberal opinions into his sermons with a boldness which ranked him among the ultra whigs. Among his published works may be enumerated a volume of 7 sermons (8vo., 1749); "Christian Sobriety, in 8 Sermons to Young Men;" "Observations on the Charter and Conduct of the Society for Propagating the Gospel in Foreign Parts," &c. A memoir of him has been written by Alden Bradford (8vo., Boston, 1838).

MAYNOOTH, a market town of Ireland, co. Kildare, on the royal canal, 15 m. W. N. W. from Dublin; pop. in 1851, 2,129. It has a ruined castle built in 1426 by John Fitzgerald, earl of Kildare, and is the seat of the royal college of St. Patrick, founded in 1795 by act of the Irish parliament for the education of Roman Catholics for the priesthood. The sum of about £8,000 was voted annually for its maintenance until 1808, and since that time the government grant has been gradually increased, until it is now £80,000 per annum. Beside this, more than £60,000 has been voted at different times for the enlargement of the buildings, and the college likewise possesses an income of £460 per annum from the Dunboyne estates in the county of Meath. By the act of 8 and 9 Victoria, cap. 25, passed under the ministry of Sir Robert Peel, the institution was placed on a new foundation, and endowed for the support and education of 500 students, and of 20 senior

scholars on the Dunboyne foundation. Allowances are made to 250 members of the 3 higher classes and to the 20 Dunboyne scholars. Candidates over 16 years of age, and intended for the priesthood in Ireland, are admitted on the recommendation of their bishops, and no others can be received. The faculty consists of a president, vice-president, 4 deans, a prefect of the Dunboyne establishment, who is also librarian, a bursar, 4 professors of moral and dogmatic theology, and 1 professor of each of the following branches: natural philosophy; sacred Scripture and Hebrew; ecclesiastical history; logic, metaphysics, and ethics; rhetoric and belles-lettres; humanity; English rhetoric and French; and the Irish language. Frequent attempts have been made in the British parliament to obtain a repeal of the Maynooth grant, and a motion to that effect was negatived in the house of commons, April 29, 1858, by a vote of 210 to 155. During the parliamentary session of 1857-'8, 100 petitions with 27,000 signatures were presented to parliament for the repeal.

MAYO, a maritime county of Ireland, in the province of Connaught, bounded E. by Sligo and Roscommon, S. by Galway, and W. and N. by the Atlantic ocean; greatest length 72 m., greatest breadth 58 m.; area, 2,131 sq. m.; pop. in 1851, 274,880. The coasts are indented by numerous bays and harbors, the principal of which are Killala bay on the N., and Broadhaven, Blacksod, and Clew bays on the W. The surface toward the E. is level and fertile, but the W. districts are for the most part barren and mountainous, some of the summits attaining an elevation of more than 2,500 feet above the sea. The only river of any importance is the Moy, but the lakes are numerous, the largest being Loughs Corrib, Mask, Conn, Cullin, and Carra, the two first named belonging in part to the county of Galway. The most important minerals are iron, marble, and slate; but the iron mines, though valuable, are not worked for the want of fuel. The principal manufactures are linens, flannels, woollen stockings, and straw hats. The county returns 2 members to parliament. Chief towns, Castlebar (the capital), Ballina, and Westport.

MAYO, AMORY DWIGHT, an American clergyman, born in Warwick, Mass., Jan. 31, 1823. He passed his youth till nearly 20 years of age in his father's country store, alternating with teaching in the district schools in the winter. He entered Amherst college at the age of 20, but was compelled to leave after one year on account of ill health. He then entered upon private theological studies, particularly under the direction of Dr. Hosea Ballou, now president of Tufts college, was ordained as an evangelist in School street Universalist church, Boston, and was settled at Gloucester, Mass., over the Independent Christian church. After a ministry of 8 years in Gloucester, Mr. Mayo removed to Cleveland, Ohio, and preached one year to the Congregational society of Liberal Christians. In 1855 he took charge of the first

Congregational Unitarian society of Albany, of which he is now pastor. He has published "The Balance" (Boston, 1847); "Graces and Powers of the Christian Life" (Boston, 1852); and "Symbols of the Capital" (New York, 1859); and has also prepared a selection from the writings of his wife, with a memoir (Boston, 1849), beside contributing extensively to periodicals. Some of his latest works have appeared in a serial publication, the Albany "Tracts for the Times," and are in vindication of his peculiar religious tenets.

MAYO, WILLIAM STARBUCK, an American author, born in Ogdensburg, N. Y., April 20, 1812. He was educated at the academy of Potsdam, at the age of 17 commenced the study of medicine, and in 1838 received his diploma of M.D. After practising his profession for several years, he made a tour through the Barbary States and Spain. In 1849 appeared his first work, "Kaloolah," purporting to be the autobiography of Jonathan Romer, whose imaginary adventures in Africa are described with much vigor. This has proved the most popular of his productions. He has also written "The Berber, or the Mountaineer of the Atlas" (1850), a romance of travel and adventure, similar in vein to "Kaloolah," and "Romance Dust from the Historic Placer," a collection of stories chiefly founded on historical incidents. He has been a resident of New York for some years past.

MAYOR (Lat. *major*; Fr. *maire*), the chief municipal officer in a borough or corporate town. The office arose out of the immunities granted to free cities by sovereigns in the middle ages, and in England dates from the reign of Richard I., previous to which time the chief magistrate of a town was called portreeve or boroughreeve. In England mayors are addressed as "your worship," and those of London, Dublin, and York enjoy the prefix of lord to their titles by special royal grant. In France the *maire* is the first municipal officer in each commune. The office was alternately elective or in the gift of the government until the decree of 1855, which places the appointment of *maire* in the capital of each department, arrondissement, and canton, and in communes containing 3,000 inhabitants, in the hands of the emperor; in communes of a less number of inhabitants he is appointed by the prefect of the department. Apart from his special municipal functions, he is charged, as the agent of the imperial government, with the publication and execution of its decrees, the preservation of public security, the preparation of statistics of marriages, births, &c., and with judicial power over certain minor offences. The chief executive officers of cities in the United States are termed mayors, and are elected annually or biennially by the citizens.

MAYOR OF THE PALACE (Lat. *major domus regis*, *magister palatii*), an officer of state in France under the Merovingian kings, who originally exercised the functions of royal steward, having the management of the king's es-

tates and the direction of his household. By degrees these functionaries usurped almost the entire power of the state, the king remaining such only in name, while the mayor, becoming his guardian or overseer rather than his minister, exercised his prerogatives in the interests of the feudal aristocracy. This assumption of absolute power dates from the middle of the 7th century, when the administration of Austrasia, Neustria, and Burgundy was engrossed by their mayors, Grimoald, Archambaud, and Ebroin. Pepin, who subsequently became mayor of Austrasia, from 688 to his death in 714 ruled France with absolute sway, and was succeeded by his natural son Charles Martel, whose son Pepin, the father of the emperor Charlemagne, took the title of king, and founded the Carolingian dynasty of French monarchs. After the accession of Pepin to the throne the office lost much of its importance, or was altogether abolished.

MAYSVILLE, a city and the capital of Mason co., Ky., on the Ohio river, 63 m. S. E. from Cincinnati and 60 m. N. E. from Lexington; pop. in 1860 estimated at 7,000. It was settled in 1784, and was originally called Limestone, but received its present name in 1788 after John May, one of its early settlers. It lies on a bend of the river, and is backed by a range of hills which give it a very attractive appearance. The city has an active trade derived from a large portion of north-eastern Kentucky, and is the most extensive hemp market in the United States; it also contains numerous manufactories of cotton and hemp fabrics. Two railroads are projected, one to Lexington, and another to the mouth of the Big Sandy river, to connect with the Covington and Ohio railroad. It contains, beside the county buildings, a handsome city hall, a hospital, 2 banks (capital \$750,000), about 90 stores, 2 steam cotton factories, a large bagging factory, several iron founderies, an extensive coal oil refinery, 7 churches, and many schools.

MAZARIN, JULES (Ital. MAZARINI, or MAZARINO, GIULIO), cardinal, a French statesman, born at Piscina, in the kingdom of Naples, July 14, 1602, died in Paris, March 9, 1661. He was of a noble Sicilian family, received his early education at Rome, and afterward studied law at the universities of Alcalá and Salamanca in Spain. He embraced the military profession, and in 1625 was a captain in the papal army. Even at this early age he displayed remarkable diplomatic talent, and was employed in important negotiations with the French and Spanish commanders in Italy. He, however, soon quitted the army, and entering the civil service of the pope was attached to the suite of Cardinal Sacchetti, the papal ambassador at Turin. In 1629 the cardinal returned to Rome, leaving Mazarin at Turin, with the title of internuncio, and full powers to conclude a peace. In this capacity he went to Lyons in 1630, where he was presented to Louis XIII., and subsequently to Cardinal Richelieu, who greatly admired his talents, and succeeded in attaching

him to the interests of France. In 1634 Richelieu caused him to be made vice-legate of Avignon, and in 1641 procured for him a cardinal's hat from Pope Urban VIII. After the death of Richelieu in Dec. 1642, Mazarin became a member of the council of state; and on the death of Louis XIII. in May, 1643, the regent Anne of Austria made him prime minister. He affected at the beginning of his administration much humility and moderation. He was affable and complaisant in his manners, and appeared in public without guards and without any assumption of state. In spite, however, of this cautious policy, a powerful party was soon organized against him, headed by the duke of Beaufort, the prince of Conti, the duchess of Longueville, and the wily and turbulent De Retz, archbishop-coadjutor of Paris. The people being already heavily taxed, the parliament of Paris refused to consent to a new impost, and the cardinal caused Blancmesnil, its president, and Broussel, one of its most popular members, to be arrested. Instigated by De Retz and the other leaders of the opposition, the citizens of Paris rose in insurrection in Aug. 1648, and thus began the civil war of the Fronde. Mazarin fled to St. Germain with the queen regent and the young king, and was proscribed by the parliament as a disturber of public order. Peace was restored March 11, 1649, chiefly through the influence of the great Condé, who, however, conducted himself with such arrogance that Mazarin in self-defence caused him to be arrested and imprisoned, Jan. 12, 1650, together with the prince of Conti and the duke of Longueville. The parliament espoused the cause of the princes, and issued a decree of banishment against Mazarin. As the parliament was sustained by the people, the cardinal yielded to the storm, liberated the princes in 1651, and fled himself to Germany. His influence over the queen, to whom he is supposed to have been secretly married, was so great that he still governed the kingdom from his exile; and in 1652, the excitement against him having apparently subsided, he entered France at the head of an army of 6,000 men under the authority of a passport from the queen. The prince of Condé was at this time again in rebellion, and the young king Louis XIV., who had recently assumed his majority at the age of 14, was at Poitiers with his court, and toward that city Mazarin directed his march. The news of his return to France created great commotion at Paris. The parliament hastily assembled; and although a letter from the king was read declaring his approbation of Mazarin's movements, the parliament decreed that the cardinal was a rebel, and ordered his magnificent library and other property to be sold, and from the proceeds of the sale 150,000 livres set apart as a reward to whoever should deliver him up dead or alive. The cardinal, regardless of these decrees, continued his march, and at the end of a month reached Poitiers, where he was received by the king and the whole court with the greatest demonstrations of delight. The civil war

continued for some months longer, being carried on by the princes and the parliament on the pretext that the king was a prisoner in the hands of Mazarin, whose foreign birth made him peculiarly unpopular. At length the cardinal, finding that nearly all parties were weary of the contest and only needed an excuse for laying down their arms, prudently tendered his resignation as prime minister, and withdrew from the court. His resignation being accepted, the parliament at once submitted, together with all the great leaders of the Fronde except Condé, and the king returned to the capital amid the acclamations of the people. Louis immediately began to assert his authority with vigor. He ordered Cardinal de Retz, the principal instigator of sedition, to be arrested, and sent him to prison at Vincennes. As this decided step was not resisted by the people, though it made a great sensation, Mazarin, who had meanwhile taken command of the army on the frontier, and gained some successes over the Spaniards, seized the occasion to return to Paris while his military glory was yet fresh. The king and the courtiers went out several miles beyond the walls to welcome him, and he entered the capital in triumph, in the same carriage with the king, amid the general rejoicings of the fickle Parisians, who kindled bonfires in his honor in the streets, and gave him a splendid banquet at the city hall. His first care after his return was for the public finances, which were in great disorder, and next for his own, which had suffered considerably by confiscation during his exile. His financial skill and his thrifty habits soon restored his own fortunes. He advanced those of his family, and gratified his pride at the same time, by marrying one of his nieces to the prince of Conti, a scion of the younger branch of the royal house of Bourbon, and another to the eldest son of the duke of Modena. Others were already married to great noblemen, and he had refused the hand of yet another, Maria de Mancini, to Charles II. of England, at a time when there seemed to be little prospect of that prince regaining the throne of his ancestors. From his return to Paris till his death Mazarin ruled France with absolute power, the king quietly submitting to his guidance in every affair of state. His last great stroke of policy was his masterly negotiation of the peace of the Pyrénées with Spain in 1659, and the marriage of Louis XIV. with the Spanish infanta, which was celebrated in the following year. "Cardinal Mazarin," says Hénault, "was as gentle as Cardinal Richelieu was violent; one of his greatest talents consisted in knowing men thoroughly. The character of his policy was rather finesse and prudence than force. There was in Cardinal Richelieu something greater, vaster, and less composed; in Cardinal Mazarin more address, more management, and fewer extravagances. People hated the one and derided the other; but both were masters of the state." Mazarin had accumulated during his administration a sum of 40,000,000

livres, equivalent to 200,000,000 francs at the present day. On his deathbed his conscience troubled him about his property, and he gave it to the king, who after keeping it 8 days restored it, and it became the inheritance of the cardinal's relations.

MAZATLAN, a seaport town in the state of Sinaloa, Mexico, and the most considerable on the Mexican coast; pop. about 12,000. It has a very picturesque appearance, whether approached from the sea or by land. On the N. side of the bay or roadstead is a long neck of rocky and fantastic hills, their sides exhibiting projecting crags and deep indentations. Beneath these hills, on the verge of the sea, the houses are thickly crowded together; but the best portion of the town lies on more level ground, and directly facing the roadstead. On the S. are rocky islands, protecting the harbor in that direction. But there is no protection from the W. and S. W.; here the harbor is exposed to the broad Pacific; and when the wind is from that quarter, the sea rolls in with great force. The town is handsomely laid out, and its streets, though narrow, are lined with large and well built houses. Much taste and sometimes luxury are displayed in many of the public buildings and dwelling houses. The style of the buildings is that of the old Castilian, with short columns, Moorish capitals, and ornaments. Some of them present long lines of colonnades. The shops are numerous and well filled. Mazatlan is the port for the neighboring districts, and carries on an extensive commerce with England, France, and the United States. Formerly it received many goods from India. The steamers running between Panama and San Francisco usually stop here in passing. In 1856, 81 foreign vessels arrived there, tonnage 7,168.

MAZEPPA, JAN, hetman of the Cossacks, born about 1635, died in Bender, Turkey, in 1709. He was the son of a Polish gentleman in Podolia, and at an early age became page at the court of John Casimir, king of Poland. On returning to his native province he formed an improper intimacy with a married lady, whose husband caused him, according to the common story, to be tied to a wild horse, which was then let loose on the plains and ran till he reached the country of the Cossacks, where Mazeppa was unbound, and kindly treated by the inhabitants. Another account says that Mazeppa was fastened to his own horse, which brought him back to his own door, and that, unable to endure the disgrace of his position, he left his country and took up his residence among the Cossacks. However he may have arrived among them, his abilities soon gave him great influence, and on the death, in 1687, of the hetman Samoilovitch, whose secretary and adjutant he had been, he was chosen to the chief command. He attained to high favor with Peter the Great; but when the Russians began to encroach on the liberties of his adopted country, he entered into secret connection with Stanislas Leszczynski of Poland, and subsequently into a

league with Charles XII. of Sweden. These plans failed, Mazeppa being besieged by the czar in his capital, whence he at last escaped with an inconsiderable force. The result of the battle of Pultowa (1709) put it out of the power of Charles to aid him, and both fled to Turkey. Mazeppa is the hero of one of Lord Byron's poems, and of several of Horace Vernet's pictures.

MAZZINI, GIUSEPPE, an Italian political leader, born in Genoa in 1809. He is an only son, and grew up in company with two younger sisters and a mother, who encouraged his patriotic aspirations, which however met with no sympathy from his father, a wealthy physician. He received an excellent education at home, learned the German, French, and English languages, devoted considerable attention to literary studies, and excelled in playing the guitar. With a view of becoming a lawyer, he studied jurisprudence at the university of Genoa, where his earliest friend and constant associate, Jacopo Rufini, studied medicine. The two young men set forth their political views in poetical effusions and literary essays in a Florentine publication (*Antologia*), from 1820 till about 1830 the great repository of the thoughts of the most accomplished and enthusiastic youths of Italy. The French revolution of 1830 was hailed with delight by the young patriots, and led them to instigate political conspiracies, which were detected, and Mazzini was imprisoned in the citadel of Savona. His mother could only communicate with him by putting slips of paper in his bread, and informed him in this manner of the rising of the Poles, an event which tended to inflame his revolutionary ardor. After 6 months' detention he was set free, but only to be expelled from the country. He betook himself to Marseilles, at that time the head-quarters of Italian exiles, who mainly at his suggestion organized a league called *la Giovine Italia*, or Young Italy, the object of which was to republicanize the peninsula. This project was furthered by a journal of the same name, edited by Mazzini. Most of the members, including Mazzini, were at that time carbonari, but afterward dissolved their connection with that body, the centralizing tendencies of which they opposed. The motto of "Young Italy" was: "Now and ever;" the emblem of the league was a branch of cypress. Inscribed upon one side of the national flag were the words: "Liberty, equality, and humanity;" and upon the other, "Union, independence, God, and humanity." The bond of union consisted in an oath of allegiance to a common political creed. Faithless members were arraigned by the league, and in case of treason even sentenced to death. Secret sessions were held, and a central committee appointed to wield the executive authority. The members further pledged themselves to resort to active measures for the purpose of liberating their country and for the promotion of the interests of humanity. Mazzini was the leading spirit of this movement. His influence

was enhanced by a commanding presence, expressive both of manly beauty and moral elevation, by the eloquence of his fiery appeals, and by literary capacities of a high order. Even one of his opponents, Mariotti, admitted that there was something in his dark luminous eyes, and in his majestic brow, which commanded obedience. Among the most active emissaries of Young Italy were sailors, who scattered Mazzini's inflammatory publications all over the peninsula. The movement soon attracted the attention of the authorities. A private correspondence in cipher was intercepted, and disclosed the purpose of raising guerilla bands, and other formidable preparations of a revolutionary character. Extracts of this correspondence were published in the latter part of 1832 in the Roman journal *Notizie del giorno*, and traced to Mazzini and his fellow conspirators. A circular inviting the coöperation of republican leaders in foreign countries was addressed, in Feb. 1833, to a journalist of Paris, and was signed Strozzi, the *nom de guerre* of Mazzini, each member of the Young Italy association assuming a feigned name. On Oct. 20, 1832, one of the Italian refugees (Emiliani) at Rhodéz, in southern France, was murderously attacked by 6 of his compatriots, who were said to have acted under the instructions of Young Italy, but which was denied by Mazzini in a letter addressed (Nov. 18) to the *Éclaireur de la Méditerranée*. In Jan. 1833, however, the *procureur général* at Rhodéz was said to have received positive information of a sentence of death signed by Mazzini and passed by the central committee of Young Italy upon Emiliani and Sturiatti, and of a sentence of flogging upon Lazzareschi and Andriani (all of whom were members of the league), the two former having been found guilty of circulating publications "hostile to the holy alliance of the Italian patriots," and of being on friendly terms with the holy see. According to the same authority, 4 persons were appointed by the committee to carry out the sentence; and failing to do so, they would have forfeited their own lives. Although the assailants of Emiliani in 1832 had been sentenced to 5 years' imprisonment by the French authorities at Rhodéz, those intrusted with the execution of the alleged sentence were not to be deterred; and one of them, Garioli, on meeting Emiliani and Lazzareschi (on May 31, 1833) in a coffee house of that town, fatally stabbed the latter with his stiletto. Stabbing Emiliani's wife, who had endeavored to save her husband, he next inflicted mortal wounds upon Emiliani, from which he died soon afterward. In the legal proceedings, however, which were instituted against Mazzini by the French government, he could not be convicted as a party to the assassination; but in addition to the suspicion which rested on him in this matter, his name was associated with political and military conspiracies which were discovered in Piedmont in 1833, and with their ramifications in Naples and other parts of Italy. After continuing for some time to issue his jour-

nal from a hiding place in Marseilles, he was at length compelled to leave the French territory and to seek refuge in Switzerland, where, in connection with Polish, German, and other Italian refugees, he planned the adventurous Savoy expedition. The central committee of the "Young Italy" league at Geneva, with Mazzini as its head, and the Polish general Roman Soltyk, constituted a council of war; and among its most conspicuous members were also the retired French general Damas and the Spanish general Mendez Vigo. In Nov. 1833, propositions were made to Gen. Ramorino (who had fought in the Polish revolutionary war) to command the expedition; and according to Mazzini, who furnished a large proportion of the funds for this enterprise, that adventurer received nearly \$8,000 for his services. The plan of the revolutionists, who were assembled partly at Carouge, and partly on the northern shore of the lake of Geneva, was to seize the fortress of St. Julien, in Savoy, and the small town of Annecy which commanded the road to Chambéry. Another wing of the revolutionists was to advance from Les Échelles, Ramorino's whole force (which consisted, however, of hardly 1,000 fighting men, chiefly Poles, Italians, and Germans) to unite at Chambéry, the capital of Savoy, and to organize from that place military operations against Piedmont. The attack was actually made on Feb. 1, 1834, at the frontier of Savoy, upon a handful of custom house officers; the custom house was destroyed, and the insurgents advanced to the village of Annemasse, where a proclamation signed by Mazzini, Melegari, and Jacopo Rufini, announced the formation of a provisional government at St. Julien; but it had no effect upon the people, except to afford to some shrewd traders opportunities of smuggling during the confusion in the custom house department. Ramorino, lingering on the road to St. Julien, without attempting to seize that fortress, left the battle field on the evening of Feb. 1, as soon as he heard of the advance of the royal troops; while the insurgents, who had succeeded (Feb. 8) in crossing the bridge near Les Échelles, were completely routed by the soldiers of the garrison at Pont de Beauvoisin. Ramorino was accused of treachery; but after his arrival in Paris he endeavored to vindicate his conduct and to throw the blame of the failure upon Mazzini and his friends. Sentence of death *in contumaciam* was passed by the Sardinian courts upon Mazzini, who however remained unmolested in Switzerland, residing partly in the cantons of Vaud and Geneva, but chiefly at the watering place of Bachtelen, near Grenchen, in the canton of Soleure. Many of those implicated in the Savoy expedition were expelled from Switzerland, particularly the Polish refugees. But before their actual departure from the country, Mazzini had succeeded in obtaining the coöperation of the principal representatives of the various nationalities in the organization of a new association, to be called Young Europe. "Young Italy," "Young Po-

land," &c., appointed delegates, who on April 15, 1834, solemnly agreed to abide by the political, social, and religious platform which was laid down by Mazzini, and the terms of which were published in the languages of the different nationalities. The new league summoned the nations of Europe to rise against their despotic rulers. Mazzini's general instructions for its members imposed faith in God as the sole and supreme ruler of the universe, in his immortal laws as the expression of the divine will, and in humanity as the sole interpreter of those laws. The main object of Young Europe was, according to Mazzini, to lay the foundation for a universal development of thought and action, which would lead to the discovery and practical application of the divine laws of human government. Mazzini defined the league as the young Europe of the people, which was to supplant the old Europe of kings; as a conflict between the modern principles of freedom and the mediæval system of servitude, between the modern sentiments of equality and the old spirit of caste, monopoly, and privileges; and finally, as a triumph of new religious aspirations and ideas over the tottering fabric of a decaying ecclesiasticism. The social application of Mazzini's principles is fully explained in his work, *Fori et senar* (Biel, 1835). His ideal of a republic, according to this work, consists in a bond of love and union between mankind, founded upon the principle of association. Freedom was to be one of its elements and one of its most essential conditions, but the association was to be rather religious than political; for "political parties fall and expire," he says, "but religious parties never die, unless they have attained their utmost perfection and accomplished their mission by becoming thoroughly identified with the life of humanity." Dissensions between Mazzini and the "Young Switzerland" (in whose interest a journal of that name had been published at Biel chiefly under his influence) and the "Young Germany" parties led him to withdraw from the central committee of Young Europe, and also of the Young Italy league, without however relaxing his zeal for the furtherance of the ends of both of these associations, of which he continued the principal leader. With the exception of a brief term of arrest in 1835, Mazzini was not interrupted in his agitation in Switzerland until 1837, when, yielding at length to the representation of foreign powers, the Swiss authorities requested him to leave; and provided with a passport from the French embassy, he departed for England via France. London became henceforward his head-quarters for revolutionizing Italy and Europe, while a secret asylum near Geneva enabled him to be near the scene of action in the contingency of an insurrection in Piedmont. His numerous partisans and friends continued the secret political agitation in Italy, while Mazzini labored by writing and by public addresses in the meetings of the Poles, Italians, or other oppressed nationalities in London. He wrote

articles for the "People's Journal," the "Monthly Chronicle," Lowe's "Edinburgh Journal," the "Foreign Quarterly Review," and the "Westminster Review." Among them are papers on Byron and Goethe, George Sand, Victor Hugo and Lamartine, Thiers and Carlyle, on Fourierism and communism, and on Italian and German music. Beside publications, in journals and in pamphlets, on the political condition of Italy and other European states, he wrote extensively in behalf of a comprehensive system of popular education. Some of his most striking ideas in that regard are laid down in the Italian journal *Apostolato popolare*, which he published in London from 1840 to 1843. In 1842 he wrote a preface to a new edition of Dante's *Divina Commedia*, and prepared a complete edition of the works of Ugo Foscolo. He founded in London in 1840 a Sunday school for poor Italian children, and officiated in person as one of the teachers.—The tragic fate of the brothers Bandiera called public attention with increased force to Mazzini in 1844, he being considered as the inspiring spirit who had led those patriots to make the daring attempt upon the Austrian fleet which cost them their lives, although Mazzini had in reality opposed that particular movement. At the same time the English minister, Sir James Graham, was detected in having opened and intercepted letters addressed to Mazzini, which led to the discovery and the suppression of the Bandiera conspiracy; and the proceedings which the despotic powers wished the English government to institute against the Italian refugees fell to the ground amid the general cry of indignation at the conduct of Sir James Graham, to whom Mazzini addressed a spirited letter on the occasion, which contributed to increase the popularity of the latter. After having protested in 1846 against the enlistment of Swiss soldiers for the papal army, and against the annihilation of the republic of Cracow, he founded in 1847 an "international league of peoples," the principal object of which was to enlighten the people of England upon foreign politics, and to diffuse principles of self-government among the nations of Europe. At the end of 1847 he proceeded to Paris to confer with other leaders in regard to the growing revolutionary feeling in Italy, but soon returned to London, where the revolution of Feb. 24, 1848, took him like many others completely by surprise. Five days afterward he returned to the French capital, where he had an interview with Gioberti, Mamiani, and other leaders of the constitutional party; but Mazzini was opposed to the annexation of the smaller Italian states to Sardinia, which was eventually proposed by those statesmen. On March 3 he issued an address to the people of Lombardy, congratulating them upon the success of their insurrection, and 11 days afterward (April 10) he set foot on Italian soil after 17 years' of exile. His reception at Milan was a triumph, but his exertions there in behalf of national in-

dependence were neutralized by the vacillating policy of Charles Albert, whom he characterized as the Hamlet of monarchs. After having been foiled in Milan, and endeavored in vain to raise the standard of rebellion in other parts of Italy, Mazzini offered to enlist as a common soldier under Garibaldi, whose vanguard was on the point of advancing in forced marches from Monza to Bergamo, when the capitulation of Milan to the Austrians (Aug. 5) led to the disbandment of the patriots. In a pamphlet published in 1850 in Brussels, *Cenni e documenti intorno all' insurrezione Lombarda e alla guerra regia del 1848*, Mazzini relates the circumstances which proved fatal to his efforts and those of other radical leaders in Milan during the revolution of 1848, and which compelled him to retire to Switzerland. Soon after his arrival there, the news of the rising in Tuscany was received, together with the continued resistance of Venice, which from the beginning had acted in accordance with his republican views under the lead of Manin, and encouraged him to depart for Florence. Here he became a member of the provisional government, and was sent as deputy to the Roman republic, which had been proclaimed in Feb. 1849. He was elected a triumvir by the Romans, and became the ruling spirit of the republic, the hopes of which, however, were blighted by French intervention, Rome surrendering to Marshal Oudinot after a heroic resistance, and the French entering the city, July 8. Mazzini left Rome without a passport in an Italian ship, and proceeded to Marseilles, and from thence to Lausanne, where he was met by Saffi and other friends. Venice surrendered to the Austrians in August, but Mazzini continued at Lausanne the journal entitled *Italia del popolo*, which he had commenced at Milan, and addressed letters to De Tocqueville, De Falloux, and Montalembert, vindicating his administration in Rome, and denouncing them as the destroyers of Roman liberty. He remained for some time in Switzerland, organizing there a new national committee for continuing his agitations. His secret asylum there consisted of a cottage which had been purchased by his friends, only the most intimate of whom were acquainted with its locality. Persons were conducted there in a carriage with their eyes bandaged until they reached the vineyards in the midst of which it is situated. His other hiding places on the continent and in London were equally inaccessible and well protected by his friends. On his return to London he united his efforts with those of Ledru-Rollin, Kossuth, Arnold Ruge, and other revolutionary leaders. His name was associated with the dagger insurrection in Milan (Feb. 6, 1853), started by a number of young enthusiasts who were led on by the inflammatory zeal of Mazzini, but which was promptly suppressed by the Austrian government. Among those most active in coöperating with Mazzini was Orsini; but on returning to London, after an abortive insurrection attempted at Milan in

1854, at the suggestion of Mazzini, he separated himself from him; and in his memoirs, which appeared in Edinburgh in 1857 before his attempt upon the life of Napoleon III., he reproached Mazzini with recklessness and disregard of the lives of his friends, and expressed his distrust in his ability to control the storms roused by his agitation, and which generally proved fatal to those who embarked in these efforts. Mazzini, however, persisted in his propagandism; and notwithstanding the disapprobation of Manin and of other republican leaders, he again instigated an insurrection in Sardinia in 1857, and proceeded to Genoa to superintend it. His followers seized Fort Diamante in the night of June 29; but as the people did not join the movement, Mazzini was compelled to abandon the enterprise. Miss White (now Mme. Mario), an English lady and one of his devoted followers, was arrested on this occasion. His friends who attempted similar outbreaks at Leghorn and Naples fell into the hands of the government, including those captured on board the steamer Cagliari, and were put to death or doomed to imprisonment, while Mazzini himself retired to his place of concealment near Geneva, and afterward returned to London, where he endeavored to vindicate his course in a pamphlet entitled "The late Insurrection defended by Joseph Mazzini" (London, 1858). After the suppression of the *Italia del popolo* in Genoa, he established at the end of 1858 a weekly journal in London, entitled *Pensiero ed azione*. During the war of 1859 in Lombardy, he constantly resisted the idea that Italy could be benefited by the intervention of Napoleon III., though he called upon his countrymen to promote the expulsion of the foreign enemy by revolutionary movements in other parts of the country. However, since the consolidation of Upper Italy he has exhibited a less hostile frame of mind toward the Sardinian royal house as the representative of Italian unity. Still it is certain that a manifesto attributed to him, and renouncing republicanism, was a fabrication. Garibaldi's expedition to Sicily in 1860 called him to new activity, the character of which is not yet clearly defined.—Conspicuous among the many qualities for which Mazzini is admired by his friends, are his Spartan-like simplicity and frugality, and his integrity. He has sacrificed his own patrimony for the cause of his country, and although considerable sums of money have passed through his hands, he has always restricted his private expenditures to the barest necessities of life, and submitted himself to the greatest privations.

MAZZOLINI, Lodovico, an Italian painter, born in Ferrara about 1481, died there in 1530. He was a pupil of Lorenzo Costa, and in small pictures, particularly his miniature altarpieces, attained great excellence. His architectural backgrounds are especially admired. His works are not numerous, but are to be found in the chief galleries of Europe. The national gallery in London possesses two excellent holy families by Mazzolini.

MAZZUCHELLI, GIOVANNI MARIA, count, an Italian jurist, antiquary, and biographer, born in Brescia in 1707, died there in Nov. 1765. He was educated at Bologna, and afterward became keeper of the Quirinian library in his native city, where he devoted himself to Italian antiquities and biographical literature. He wrote *Notizie storiche e critiche intorno alla vita, alle invenzioni ed agli scritti di Archimede Siracusano* (Brescia, 1737); *Gli scrittori d'Italia, cioè notizie storiche e critiche intorno alle vite ed agli scritti dei letterati Italiani* (6 vols. fol., 1758-'63, not complete), and many other works; and left a vast collection of casts and medals, afterward engraved and published.

MEAD, RICHARD, an English physician and author, born at Stepney, near London, in 1675, died in London, Feb. 16, 1754. He studied at Utrecht and Leyden, received the degree of M.D. at Padua in 1795, and returning to England settled at Stepney. In 1708 he was elected a member of the royal society, of which Sir Isaac Newton was then president, and in the same year was chosen physician of St. Thomas's hospital. In 1711 he was appointed anatomical lecturer to surgeons' hall, and in 1714 removed to London. In 1719, when the plague broke out at Marseilles, he was consulted by the government as to the best method of excluding it from England, and in 1727 was nominated physician to George II. The wealth derived from his practice was chiefly devoted to the patronage of science and literature, and to the collection of a valuable library, antiquities, and works of art. His "Medical Works" were published in 1762 (4to., London).

MEADE, a N. co. of Ky., on the Ohio river, drained by Otter and Spring creeks and other tributaries of the Ohio; area, about 400 sq. m.; pop. in 1850, 7,898, of whom 1,578 were slaves. It has an undulating surface and fertile soil. The productions in 1850 were 878,145 bushels of Indian corn, 125,188 of oats, 210,427 lbs. of tobacco, and 13,095 of wool. There were 10 grist mills, 2 saw mills, 2 tanneries, and 9 churches. Capital, Brandenburg.

MEADE, RICHARD KIDDER, an American revolutionary soldier, born in Nansemond co., Va., about 1750, died in Frederic, now Clarke co., in the early part of the present century. He was educated at Harrow school in England, and soon after his return to Virginia embarked in the revolutionary contest. In Dec. 1775, he commanded a company at the battle of the Great Bridge near Norfolk, the first fought in the state, and soon after he was appointed by Washington one of his confidential aids, in which capacity, with the rank of colonel, he rendered signal service throughout the war. He was with the commander-in-chief in all his great battles, and superintended the execution of Major André, a duty which he was accustomed to say he could not perform without tears. The latter part of his life was passed on his estate in Frederic co., where he principally

occupied himself with agricultural pursuits.—**WILLIAM, D.D.**, son of the preceding, an American clergyman, bishop of the Protestant Episcopal church in the state of Virginia, born in Frederic, now Clarke co., Va., Nov. 11, 1789. He was graduated at Princeton college in 1808, and 3 years later was ordained to the ministry of the Protestant Episcopal church by Bishop Madison of Virginia. Entering upon his duties at a time when the Episcopal organization in Virginia had from various circumstances fallen into decay, he attracted attention by the earnestness of his preaching and his efforts to strengthen the numbers and influence of his denomination. The centre of his ministerial labors was from the first the parish church near his patrimonial home; and being independent in his pecuniary circumstances, he for many years officiated gratuitously in his own parish and in the surrounding country. In 1818-'14 he took an active part in procuring the election of Dr. Moore of New York as the successor of Bishop Madison in the episcopate of Virginia, and contributed materially to the establishment of a diocesan theological seminary, and various educational and missionary societies connected with his denomination, now in active operation in Virginia. In 1829 he was unanimously elected assistant bishop of Virginia, and in August of that year was consecrated in Philadelphia to the episcopal office. He thenceforth assumed the chief care of the diocese, and in 1841, upon the death of Bishop Moore, had the sole charge of it. Ill health soon compelled him to ask for an assistant, who was provided in 1842 in the person of Dr. Johns of Baltimore. Bishop Meade has, however, steadily performed his episcopal duties down to the present time, visiting his large diocese biennially, beside delivering annually a course of lectures at the Episcopal theological seminary, and publishing occasional tracts and treatises on doctrinal questions, local church history, &c. His doctrinal views are of that class known as evangelical, and he has been for a number of years the acknowledged head of the evangelical branch of the Protestant Episcopal church in the United States. His publications comprise "Family Prayer" (Alexandria, 1834); "Lectures on the Pastoral Office;" "Lectures to Students" (New York, 1849); and "Old Churches, Ministers, and Families in Virginia" (2 vols. 8vo., Philadelphia, 1856).

MEADOW LARK, a starling, of the American genus *sturnella* (Vieillot). The body is thick and stout, the legs large, with hind toes reaching beyond the tail, which is short, even, and of narrow pointed feathers; the bill is nearly straight, and 3 times as long as high; inner lateral toe longer than the outer; hind claw nearly twice as long as the middle; feathers of head stiffened, the shafts above extended into a black bristle. The common species (*S. ludoviciana*, Swains.) is about 11 inches long, with an extent of wing of 16, and the bill 1½ inches; the color above is dark brown, each feather with a brownish white margin and a

pale reddish brown terminal spot; wings and tail with dark brown bars; yellow beneath, with a black pectoral crescent; sides, rump, and tibiae pale reddish brown, with blackish streaks; a light median and superciliary stripe, yellow in front of the eye, and a black line behind. It is found in the eastern United States to the high central plains, extending perhaps as far south as Mexico. It is abundant in the southern states in the winter, whence it proceeds northward as far as Maine to breed, returning in the autumn in small flocks; the flight is generally short, unsteady, and at a moderate elevation; the notes at early morning are loud and melodious. The males are very pugnacious in breeding time; the nest is made of grasses in a hollow of the ground, and is covered over like an oven; both sexes incubate; the eggs, 4 or 5, are white, with reddish brown spots at the larger end; the young are hatched about the end of June in the middle states. The meadow lark is the friend of the farmer in its destruction of injurious larvae, but it sometimes pulls up the young corn, grain, and rice; it occasionally kills small birds, especially in confinement. In autumn and winter meadow larks are fat, and are sought by the sportsman; the flesh of the young is esteemed as food. On the Pacific coast there is found the western meadow lark (*S. neglecta*, Aud.), nearly resembling the other, but rather paler in tint, with the yellow on the chin and throat extending on the sides of the lower jaw. This bird is related to the starlings of Europe, of the genus *sturnus* (Linn.).

MEADOW MOUSE, the common name of the small rodents of the genus *arvicola* (Lacép.). The molars are $\frac{3}{2}$, and rootless; the ears are short, nearly hidden in fur; the muzzle is broad and rounded; the tail shorter than the body, cylindrical and hairy, soles naked anteriorly; the skull short, deep, and broad; whiskers in 5 horizontal series. The common meadow mouse (*A. riparia*, Ord) of this country is $4\frac{1}{2}$ inches long, and the tail about $1\frac{1}{2}$; the feet large and scaly; hair rather short; the eyes small, the thumb of the fore foot obsolete, and mammae 4 inguinal and 4 pectoral; the color above is dark brown, varied with reddish and yellowish brown; ashy plumbeous below; tail and feet dusky. Many other species are described in vol. viii. of the report on the "Pacific Railroad Survey." The European species are called also *campagnols* and *voles*; the largest is the *hypudatus amphibius* (Ill.), which is aquatic in its habits, inhabiting the banks of streams and digging in the marshes for roots. The *campagnol* (*H. arvalis*, Ill.), of the size of a mouse, is yellowish gray above, and whitish gray below; it lives in holes dug in the ground, in which it collects food for the winter. The economic meadow mouse (*H. aconomus*, Ill.) lives in Siberia, laying up ample winter stores, and sometimes migrating in large troops like the lemmings.—The meadow mice are spread over the northern hemisphere of America, Europe, and Asia, as yet not having been found in South America

and Africa; they are abundant in the mossy swamps in the vicinity of the arctic circle. Some are aquatic, having the antitragus of the ear so developed as to act as a valve under water; others live in dry places and high lands, where they do much mischief by gnawing the bark of trees and destroying grain and fruit; they do not climb, and are not dormant in winter, but retreat at that time to their well-stored burrows. They are very prolific, and, from the great number of individuals, are the source often of considerable loss to the farmer; in 1818 and 1819 most of the harvest of Holland, and in 1837 of that of an entire province of Italy, was destroyed by them; in a German province in 1822, 1,500,000 were captured in 14 days. These animals in their turn furnish a supply of food to carnivorous mammals, birds, and reptiles. For an account of their habits, see Audubon and Bachman's "Quadrupeds of North America."

MEADOW SAFFRON. See COLCHICUM.

MEADVILLE, the capital of Crawford co., Penn., on the left bank of French creek; pop. in 1850, 2,578. It is in the midst of a very fertile country, for which it is the principal market. It is the seat of Alleghany college, founded in 1817, and since 1838 under the direction of the Methodist Episcopal church. This institution has a president and 6 professors, with 104 students and 299 alumni in 1859, and a library of 9,600 volumes, and occupies a fine edifice on an elevation near the town. It is also the seat of the western theological seminary under the direction of the Unitarians. In 1850 there were 8 churches (Baptist, Cumberland Presbyterian, Episcopal, Lutheran, Methodist, Presbyterian, Roman Catholic, and Unitarian), a handsome court house, and a state arsenal.

MEAL WORM, the name given in Europe to the larva of a black heteromorous beetle, the *tenebrio molitor* (Linn.). The perfect insect, about $\frac{3}{4}$ of an inch long, appears in the evening in the least frequented parts of dwellings, in flour mills, bake houses, and pantries. The larva is more than an inch long, cylindrical, scaly, and of an ochrey yellow color; it is destructive to flour and meal, and to articles made from them; it is said to remain 2 years in this condition, and occasionally to have been eaten and rejected from the human stomach; it forms a favorite food for the domesticated nightingale.—The name of meal worm is given in New England to the larva of a small delta moth (*pyralis farinalis*, Linn.). The moth is often seen on the ceiling of rooms, resting with its tail curved over the back; the fore wings are long and narrow, and cover the hind ones when at rest; they are light brown, crossed by 2 curved white lines, and have a dark chocolate spot at the base and tip of each. The larvae are long and slender, tapering at each end, naked, and with numerous legs; they are often seen in flour barrels, meal chests, and similar places. Some of the larvae of the moths of the genus *tiar* make a thick whitish gray web over corn and meal.

MEALY BUG, a very destructive insect in

greenhouses, of the order *hemiptera*, and family *coccidae* or bark lice, the *O. Adonidum* (Linn.). The perfect insects resemble small scales; the reddish larvæ are small, but very active, flat and oval in shape; the females have a beak with which they pump up the juices of plants; they fix themselves from time to time for the purpose of changing their skin, when they cover themselves with a white, powdery, cottony substance, which has given them their common name. Several broods are produced in a year, which cause great annoyance in hot-houses; the eggs are deposited in a similar cottony material. In the natural state many are destroyed by ichneumon parasites and are devoured by birds. Alkaline washes have been found most effectual in checking their ravages, both within and out of the greenhouse.

MEANS, ALEXANDER, M.D., D.D., an American clergyman, born in North Carolina, Feb. 6, 1801. He taught school for a time in Mocksville, N. C., and soon afterward removed to Georgia. He determined to become a physician, but was able to attend only one course of medical lectures at Transylvania university, Ky. In 1840-'41 the medical college at Augusta, Ga., conferred upon him the degree of M.D. He became a local minister in the Methodist Episcopal church in 1828, and has gained a high position in the southern pulpit. In 1884 he was requested by the church to become superintendent of the manual labor school, near Covington, Ga. On the organization of Emory college in 1838 he was called to the chair of natural science, which post he occupied for 18 years, lecturing also on chemistry during part of the year at the medical college of Augusta, Ga., from 1841 to 1858. In 1858 he presided over the masonic female college in Covington, and in the following year was chosen to the presidency of Emory college, which he resigned in 1855. He then accepted the chair of chemistry in the medical college at Atlanta, lecturing there during the summer and at Augusta in winter; since 1858 he has devoted all his time to the former institution. He visited Europe in 1851, and was elected in the same year a member of the American association for the advancement of science. He received from Emory college in 1854 the degree of D.D., and in 1858 that of LL.D., and the title of emeritus professor.

MEARNS, THE. See KINCARDINESHIRE.

MEASLES (*rubeola*, *morbilli*), a contagious exanthematous fever, attended with a characteristic eruption. Up to the latter part of the last century measles and scarlet fever were confounded together, or at least were esteemed, like simple and confluent small pox, to be mere varieties of a common disease. Measles commences with the ordinary symptoms of fever, chilliness, loss of appetite, and lassitude, succeeded by heat of skin, thirst, and frequency of pulse; but in addition to these, the attack is almost invariably attended with inflammation of the mucous membrane lining the air passages; the eyes are red and watery; there is deflux-

ion from the nostrils, hoarseness, and cough. The eruption commonly appears on the 4th day, at first about the head and neck, then the trunk and arms, and finally reaching the lower extremities; it takes 2 or 3 days to complete its course, and when it reaches the feet and legs has often begun to disappear from the face. The eruption consists of little papules, somewhat resembling flea bites, of a dark red color, and which as they coalesce at their edges assume an irregularly crescentic form. The period of incubation, that is, the time elapsing from exposure to the contagion to the time of attack, is put down as from 7 to 14 days. All ages are liable to it, though infants at the breast are not so apt to be attacked as those somewhat older. A few years ago it made its first appearance at the Farøe islands, and spread like a pestilence from house to house and from village to village, sparing neither infancy nor old age in its progress. The disease is not commonly a dangerous one, though when introduced into the Society islands, some years since, it proved exceedingly fatal. When the eruption is fully out, the cough, at first dry and troublesome, generally becomes softer and less frequent; and at the end of 6 or 7 days from the coming out of the first papules they have again disappeared. Where danger occurs, it is from inflammation of the air passages; the disease may thus become complicated with croup, or in subjects predisposed to consumption the seeds of that disease may be developed. The eyes, too, are sometimes left irritable and inflamed. In all ordinary cases, a simple diet, the maintenance of an equable temperature, and perhaps the exhibition of a mild diaphoretic or expectorant, are all that is required.—For an account of measles in swine, see ENTROZOA.

MEATH, an E. maritime county of Ireland, in the province of Leinster, bounded N. by Cavan, Monaghan, and Louth, E. by the Irish sea and Dublin, S. by Kildare and King's co., and W. by Westmeath; area, 906 sq. m.; pop. in 1851, 140,750. It has only about 10 m. of coast, and no harbor of importance. The surface is generally level, the soil fertile, and the climate healthful. The chief rivers are the Boyne and Blackwater. Coarse linens, cottons, frieze, paper, &c., are manufactured. Meath returns 2 members to parliament. The chief towns are Navan, Kells, and Trim. The midland great western railway, and the Dublin and Belfast junction railway pass through the county.

MEAUX, a town of France, in the department of Seine-et-Marne, 28 m. by railway E. N. E. from Paris; pop. in 1856, 8,097. It is situated on the Marne, near the canal of Ourq. Meaux is an episcopal town, and was the see of Bossuet, the "eagle of Meaux," as he has been called, whose remains repose in the cathedral, and relics of whom are preserved in the episcopal palace.

MECOA, the chief of the three holy cities of the Mohammedans, capital of the province of El Hejaz, Arabia, 70 m. E. from Jiddah, its port

on the Red sea, and 250 m. S. from Medina, in lat. $21^{\circ} 30'$ N. and long. $40^{\circ} 8'$ E.; pop. about 45,000. It lies in a narrow valley shut in by high bare hills. Its length from N. to S. is about $2\frac{1}{2}$ m., and its breadth is somewhat less than a mile. It is not surrounded by walls, but is defended by a fortress situated on an elevation S. of the city. The houses are well built of brick and stone, and, unlike those of most oriental towns, have windows opening to the street; they generally contain apartments intended to be let as lodgings to the pilgrims who annually visit the holy city. The streets are broad and unpaved. The only public building worthy of note is the shrine or temple called *Bait Ullah*, "House of Allah," or more commonly *Caaba*, "Square House." This great sanctuary, the most famous and holy in the Mohammedan world, stands in the centre of an oblong square, enclosed by a wall 250 paces long and 200 broad, none of the sides of which run in a straight line, though at first sight the whole appears to be of regular shape. Inside of the wall is a colonnade consisting of a quadruple row of pillars on the eastern side and of a triple row on the other sides. These pillars are upward of 20 feet in height, and generally about 18 inches in diameter. Some are of white marble, granite, or porphyry, but the greater number are of common stone from the neighboring hills. The number of these pillars is variously stated by authors. Burton, the latest authority, counted 554. They are united by pointed arches, every 4 of which support a small dome plastered and whitened on the outside; these domes are 152 in number. Parts of the walls and arches are gaudily painted in stripes of yellow, red, and blue. The floors of the colonnades are paved with large stones badly cemented together. The *Caaba* is 115 paces from the northern colonnade and 88 from the southern. It is an oblong, massive structure, 18 paces in length, 14 in breadth, and from 35 to 40 feet in height, and is built of fine gray granite in horizontal courses of masonry of irregular depth; the stones are well fitted together, and held by excellent mortar like Roman cement. It was entirely rebuilt as it now stands in 1627, a torrent in the preceding year having thrown down 8 of its sides. The roof of the *Caaba* being flat, it has at a distance the appearance of a perfect cube. At the S. E. corner of the *Caaba* is the famous "black stone," which is believed to have been brought from heaven by angels. It forms a part of the angle of the building, 4 feet 9 inches from the ground, and is an irregular oval about 7 inches in diameter, with an undulating surface, composed of about a dozen smaller stones of different sizes and shapes well joined together with a small quantity of cement, and perfectly well smoothed. It looks as if the whole had been broken into many pieces by a violent blow and then united again. The color is black and metallic. Burckhardt thought it looked like a lava containing several small extraneous particles of a whitish and of a yellowish substance;

while Burton says it appeared to him a common *aërolite*. It is surrounded by a border of reddish brown cement, which is encircled by a gold or gilt ring. The pilgrims who walk around the *Caaba* begin their procession at the black stone, which is touched and kissed with the highest veneration. A pavement of granite, polished like glass by the feet of the faithful in their circumambulations, surrounds the *Caaba*. Outside of this pavement, which forms an irregular oval, is a line of iron posts supporting cross rods from which hang white or green glass globe lamps. The interior of the *Caaba* is plain, and there are no windows or any other opening except the entrance and a small door leading to a staircase to the roof. The floor and walls are covered with marble of various colors, but mostly white; and the roof and upper part of the walls are covered with red damask embroidered with gold. The interior is lighted by many lamps, but there is no other furniture except a small press in one corner in which the key of the building is sometimes placed. Near the door, outside, is a small hollow, where Abraham and Ishmael are said to have mixed the cement for building the *Caaba*. On the N. W. side are the supposed graves of Ishmael and Hagar enclosed by a semicircular wall covered with white marble. Opposite the E. corner of the *Caaba* is the *zem zem* or sacred well, believed to be that of Hagar. Its water is unpleasant in taste, and has a cathartic effect; the Mohammedans ascribe to it great and peculiar virtues. None but Mohammedans are admitted to the *Caaba* or its enclosure, but a few travellers from Christendom have ventured to enter in disguise at the risk of their lives. The most noted of these were Burckhardt and Burton. Mt. Arafat, 12 m. E. from Mecca, is visited by all pilgrims, who must perform there certain devotions and listen to an annual sermon before they can justly claim to have performed the pilgrimage. It is about 200 feet in height, and rises from a gravelly plain on which the pilgrims pitch their tents.—The trade of Mecca is chiefly derived from the pilgrims, who come from all parts of the Mohammedan world, and generally bring merchandise with them. The people are lively and polished in their manners, and have a remarkable knowledge of various languages, owing to their constant intercourse with people from remote countries. There are few artisans, and some small potteries and dye works are the only manufactories. The climate of Mecca is sultry and unwholesome, especially in August, September, and October. Little is known of the history of the place, which is undoubtedly of very great antiquity. It was the birthplace of Mohammed, and has ever since his time been regarded with peculiar reverence by his followers. It is ruled by a sherif, who at present is nominally dependent on the Turkish sultan. The Wahabees took possession of Mecca in 1802 and held it till 1818, when they were expelled by Mehemet Ali, pasha of Egypt.

MÉCHAIN, PIERRE FRANÇOIS ANDRÉ, a French mathematician and astronomer, born in Laon, Aug. 16, 1744, died in Castellon, Spain, Sept. 20, 1805. After receiving such education as the limited means of his father enabled him to give him, he became a mathematical tutor, devoting his leisure hours to the study of astronomy. Trying to sell his telescope in order to assist his father, he attracted the notice of the astronomer Lalande, who procured him a situation as hydrographer under the government. In this capacity he assisted M. Bretonnière in surveying the French coast between Nienport and St. Malo; but it was chiefly to the theory of eclipses and comets that his attention was directed, 11 of the latter having been discovered and the orbits of 24 computed by him. In 1782 the academy of sciences admitted him to membership and awarded a prize to his "Memoir on Comets." In 1791 he was employed by the national convention, together with Delambre, to measure the arc of the meridian comprised between Dunkirk and Barcelona, and, on returning to Paris, refused to deliver his papers to the academy, because he had detected a difference of 8" in his calculations respecting the latitude of Barcelona. This discrepancy so troubled his mind that, even after being appointed director of the observatory of Paris, he solicited the board of longitude to permit him to prolong the measurement of the arc from Barcelona to the Balearic islands, that he might have an opportunity of correcting his error. The board consented, and Méchain set out for Spain to conduct the operation, but fell a victim to an epidemic disorder on the way. The most important of his scientific papers are to be found in the *Mémoires des savants étrangers*; in the *Transactions* of the French academy; and in the *Connaissance des temps* subsequent to 1785, of which ephemeris he was for some time editor.

MECHANICS (Gr. *μηχανή*, *μηχανεύω*, to contrive, invent, or construct), the science in which are developed the laws of the phenomena attending or produced by means of the action of machines, or resulting from agencies such as are or could be employed in propelling machinery, and that are hence termed mechanical. In itself, this science is complete and distinct, and its usual association with certain branches of physics, under the common title of natural philosophy, is due to no necessary connection, but at the most to an incidental relationship. As in so many similar instances, the actual devising and use of mechanical combinations for needful purposes, long preceded the discovery of the general principles underlying their efficiency. Machines impelled by human or brute power, by weights, springs, water, or moving air, were invented during very early periods. Ctesibius, probably about 250 B. C., is said to have discovered and applied the elastic power of air, and to have invented certain hydraulic machines. To these his pupil, the elder Heron, added still others, including

the common pump; and among other works of this writer, his "Mechanics" and *Barulcos* (lifting of weights) especially, though, with all the mechanical writings of early times, wanting in true conception and explanation of principles, show already a very considerable progress in the descriptive knowledge and classification of machines. Heron treats of five of the so called "mechanical powers," omitting only the inclined plane; and he attempts to resolve all these into cases of the lever. Archimedes appears to have been the first to demonstrate correctly the law of the lever, and the important principle of centre of gravity. But not until the labors of Galileo and his successors, dating from the discovery of the first law of motion (1638), did mechanics begin to assume in any degree the character of a science. As now developed and extended, the subject of machinery proper is but one of its branches, though a very comprehensive one, and of growing importance.—The objects considered in mechanics are bodies, single or variously united in construction; and mechanical forces, or those which act upon bodies from without, and move or tend to move them visibly and in the mass. A body is any separately existing mass of matter. A force is any cause of motion or change, or that is capable of preventing such motion or change. Mechanical forces must be distinguished, in their nature, from those that are physical or chemical; though among the effects produced by these latter some are mechanical. Now, one or many of the forces considered in mechanics acting upon any body, and not counteracted, produce or tend to produce motion. Counteracted by equal and opposite force or forces, no motion results; the forces are then said to be in equilibrium, or the body to be in equilibrium between them; and the body is kept in a state of rest. When motion occurs, it is over certain spaces in certain times; and the relation of the space to the time fixes the speed or velocity. Again, by the motions they produce, or can produce, forces are compared and measured; and by the motions they can destroy, resistances are measured. All these, and also volumes or masses of bodies, are magnitudes consisting of a single factor, i. e., of one dimension, and so can be represented by lines. But the weight of a body is a product of two factors, a certain unit of gravitative force into a certain mass, and a pressure or momentum is a like case; these are magnitudes of two dimensions, and representable by areas. Now the elements of every mechanical question or problem are these and like magnitudes, as, 1, number; 2, space and direction, giving rise to lines, areas, solidities, and angles; and 3, time, mass, force, velocity, pressure, weight, momentum, resistances, &c. All these are quantities that can be expressed and reasoned about geometrically, and of course also arithmetically and algebraically. When, therefore, observation has collected the phenomena accurately, a pure mechanics—simply a branch of the pure mathematics—is developed, and on

one or more bases. Taken in its widest sense, mechanics deals with phenomena of all bodies, so far as these are not distinctively the results of a solid, a liquid, or an æriform state. The modifying effect of these states regarded, we have a threefold division, into solid or geo-mechanics, liquid or hydro-mechanics, and ærial or æro-mechanics. Of these, the first usually receives the name proper to the general subject. In another view, as treating of motion or equilibrium, the subject, or any one of its three divisions, has two branches: dynamics, which considers the laws of phenomena of motion; and statics, those of phenomena of equilibrium. The practice of discussing statical phenomena first in order has arisen from a misconception of the case; in reality, these are always more complex than the dynamical, since they include the counteracting as well as the acting forces. Thus, statics is a peculiar case under and offshoot of dynamics; but the science has not yet been so far recast in this method, as to warrant its presentation as a popular account of the subject. Very recently, the labors of Monge, Ampère, Willis, and Rankine have further differentiated the subject matter of the science, in a way promising to be of advantage in mechanical studies. To speak here of nothing further, it is well known that dynamics embraces the modifications and results of both motions and forces; these writers have removed out of the total subject the consideration of the modifications of pure motion—a department to which they have given the name *cinematics* (Gr. *κίνημα*, motion). Mr. W. J. M. Rankine, the last named of the above writers, recognizes as composing the theory of machines the following topics: 1, pure cinematics, which is the consideration purely of space and motion; 2, applied cinematics, or the simple theory of mechanism, dealing with such questions as the motions of a point, of a fluid surface, of a rigid solid, of a pair or elementary combination of pieces, of trains of pieces, and of aggregate combinations; 3, applied dynamics, considering the laws of motion and of deflecting forces, the nature and measure of work, the conditions of loss to which the application of various motors is subject, and the uses of the dynamometer; 4, purposes of machines, as for observation or for work, and special applications in each sort; 5, applied energetics, or the theory of prime movers and sources of power. For the best recent authorities, not only in respect to the general exposition of mechanics, but also as developing the subject in the new directions here briefly indicated, the reader is referred to Poncelet, *Mécanique industrielle*; Morin, *Leçons de mécanique pratique* (translated into English, 8vo., New York, 1860); Moseley, "Elements of Engineering and Architecture," and Rankine, "Applied Mechanics" and "Steam Engine" (London, 1859). Dealing with motions of bodies at large, mechanics investigates the movements of the celestial bodies, as well as of the terrestrial. Thus its principles run through

astronomy; and they wholly constitute that branch of the science known as physical astronomy. Again, mechanical properties and laws enter into and modify physical, chemical, and even vital phenomena. The present summary will be devoted to the principles of general and of solid mechanics. For the special subjects of liquids and æriform bodies, see *HYDRO-MECHANICS*, and *PNEUMATICS*.—The study of properties of material objects finds its place in somatology; it will be proper here to enumerate those relating to mechanical questions. These are of two classes, the general and the peculiar. Among the general, magnitude, figure, and impenetrability are necessary properties, being essential to the very idea of body; indestructibility, molecularity (constitution of molecules), porosity (physical), inertia, and mobility, inferential properties, or such as we infer from the observed behavior of bodies; while, from one or another of these latter, flow certain derived properties, as divisibility, density (in the general sense), compressibility, expansibility, &c. General properties have, of course, no opposites. In nature, and usually in our nomenclature, each peculiar property has its opposite; so that here we find porosity (sensible) and imperviousness, density (in the particular sense) and rarity, hardness and softness, flexibility and rigidity, elasticity and inelasticity, ductility and brittleness (to extension), malleability and brittleness (to lamination), tenacity and fragility. The quantity of matter a body contains is termed its mass. And because the weight of a body varies with the force of gravity, though its mass be unchanged, if we call a mass M , its weight W , and the force of gravity g , then, for any body, $M = \frac{W}{g}$; and hence, $W = Mg$. The density (in the general sense) of any body is the mass of a unit of its volume; or again, $M = dv$. In respect to elasticity, a body distorted with a certain force c , restores itself with an equal, with less force, or not at all. Calling the force of restitution r , and the ratio of this to the disturbing force c , we have, universally, $e = \frac{r}{c}$, as the expression for the fraction of the disturbing force to which in any case the elasticity is equal; e is hence the *modulus* of elasticity. In the mechanical point of view, impenetrability, inertia, mobility, elasticity, and mass are the elements in body which are of highest importance. Preeminently so is inertia, that property in virtue of which all bodies are in themselves passive, and hence incapable of changing their state, whether from motion to rest or the contrary. Indeed, the so called "three laws" of motion are but so many consequences flowing directly from this property; so that out of it, by means of the relations it establishes of mass to force, the whole of dynamics may be said to arise.—Rest, in any body, may be: 1, absolute, i. e., actual; 2, apparent, as when a real motion of the body is not perceived; 3, relative, as when the body, really in motion, preserves its place with reference to

other moving bodies. So, in itself considered, motion is: 1, absolute, or actual; 2, apparent, when, whether the body really move or not, it is by any means made to appear to move with some velocity or direction which it has not at the time; 3, relative, as when, and by the amount to which, the speed of one of two moving bodies exceeds or falls short of that of the other. Again, in reference to its character, motion is: 1, translation, when the body as a whole passes through a succession of places in space; 2, rotation, when the parts of a coherent body are made to turn about some fixed line or axis passing through its form; 3, translation and rotation combined; 4, irregular, in character. And, in reference to directions, a motion of translation is: 1, rectilinear, or straight-lined; 2, curvilinear, or along some curve, of which kind circular motion is a variety; 3, irregular, in direction. Of a translated body, the path is that of a point, the centre of mass, and is called the trajectory. By the speed or velocity of a moving body is to be understood the relative swiftness or rate of the motion. It is determined by the length of the path described in a unit of time, as the number of feet or parts of a foot traversed in one second. The most general division of velocities is into two kinds: 1, uniform; 2, variable, as when in equal times equal spaces are not passed over. The latter kind are then divided into: 1, irregularly variable; 2, continuously variable, or that which increases or diminishes by equal amounts in equal times; this is subdivided into: 1, uniformly accelerated velocity, in which the change is by equal increments; 2, uniformly retarded, in which it is by equal decrements. In a uniform velocity, V , the time being T , and the space S , it is evident that $S = V.T$; whence $T = \frac{S}{V}$, and $V = \frac{S}{T}$. In lifting a weight, we may say that we exert force which gravitation resists; or that gravitation is exerting on the body a force which we resist; both expressions are correct. It follows that force and resistance (active) are differently named only for convenience; the terms are convertible; but we conveniently call that a force which produces, and that a resistance which opposes, useful effect. But when we exert force against an immovable obstacle, or when a moving body loses part of its velocity in imparting motion to one previously at rest, the resistance experienced in either case is passive, not active; the body impinged on merely subtracts so much momentum or force from that acting on it. This passive sort of agency is never a force, but is a true resistance; though in the theory of mechanism, three like agencies, friction, fluid media, and rigidity of cordage or of bending pieces, take the name of the passive or resisting forces. True mechanical forces are of two kinds: 1, impulsive, or acting during an extremely small period of time; 2, incessant, or continued. The latter are subdivided into: 1, constant, in which the energy of application is uniform, as is true

of terrestrial gravity at a given place and elevation upon the earth; 2, variable, as is the moving force of wind passing over any fixed obstacle; and a variable force may be uniformly augmented or diminished, or irregular. A force may be measured and expressed in units of two kinds, the pressure it produces at a given moment, or the space through which it can urge a body in a given time. Weight is the form in which the first of these measures is usually taken; the unit may be one ton or one pound, &c. In the latter, if the velocity occasioned be uniform, the force $F = MV$; and hence, it is measured by the velocity it can impart to a unit of mass. If the force be constant, and V be now used to represent the velocity it can generate in a unit of time, then again $F = MV$; and the measure is the velocity the force can generate in a unit of mass in a unit of time. Motions and forces irregularly variable usually require to be averaged or summed by methods proper to analytical geometry or the calculus. The leading statical and dynamical cases will be presented under the 8 heads following.

I. Composition and Resolution of Forces or Motions. The effect and value of a mechanical force will depend on three circumstances: 1, its magnitude, or intensity; 2, the direction in which it is applied to the body acted on; 3, the relation of the point of application to the centre of mass. Evidently, mechanical forces must admit of addition or subtraction. If three horses pull in parallel directions upon a load, whether with equal or unequal effort, the amount of force they together apply is the sum of their separate forces. Any number of forces, applied on the same side of a body at the same time and in the same direction, may be replaced by a single force in that direction, applied at the common point or some intermediate one, and equal to their sum. The separate forces, or parts, are termed components; the equivalent, or total, is the resultant; the case is one of composition of forces. But of forces acting in opposite directions, the resultant is the difference, and takes effect in the direction of the greater. When the opposing forces are equal, their sum is 0, and the result is equilibrium. Of this an illustration is found in the dead pull resulting at the moment when two wrestlers put forth precisely equal efforts, so that neither can move the other. But the most important case of composition is that of forces acting in directions oblique to each other. Suppose in the same instant a body receives two impulses, one that alone would carry it northward 8 feet in one second, the other in the same time eastward 4 feet; then, at the end of the time the body is found at the opposite angle of a parallelogram, the adjacent sides of which are 8 and 4 feet respectively. The body being freely movable, this result is invariable. It is generalized in the proposition known as the parallelogram of forces: If two forces acting on a body at the same time are representable in quantity and direction by the adjacent sides of a parallelogram, their resultant

will be, in amount and direction, such a force as is represented by the diagonal of the parallelogram. This truth is only possible, however, through the existence of the further principle, which it therefore proves, that two or more motions or forces may coexist in the same body and in the same time, each having its full and proper effect. That is, no force is destroyed by the simultaneous action of one or more others; a body already in motion is relatively to any new force the same as at rest; and a body can move, or press, in such a line as to obey perfectly at the same time two motions or pressures imparted to it. This is the substance of the so called "second law" of motion, which first received a formal statement by Galileo in 1680, but was more fully established by Newton. Whether this law is susceptible of demonstration is doubted; it seems rather to be an axiom drawn from experience and reflection, and corroborated by the conformity of all subsequent observations. But a body can as well obey in the same time three, or any number of forces, the resultant of the first two with a third component yielding a second resultant, and so on; or if the forces be represented by all the sides of a polygon but one, taken around in a common direction, the resultant will be the remaining side, taken in the corresponding direction. But if the resultant of two forces answering to the sides of an oblong be that shown by the diagonal of the oblong, then it follows that a force in magnitude represented by such diagonal, and acting in the opposite direction, is just that which is required to counteract the effect of the two components first named; and when such force is applied, the result will be equilibrium; the body will be held at rest. The three forces in this case correspond to the three sides of a triangle taken around in a continuous order; so that this statical case has been termed that of the triangle of forces. The principle in this form was distinctly announced and applied by Simon Stevin, or Stevinus, of Bruges, in 1586. So, with any number of forces tending to give motion, and represented by all the sides of a polygon but one, the remaining side taken in the reverse direction is the force requisite to preserve the body in equilibrium, under the impulsion of all the others. The motions resulting in these cases are often called compound; they are exemplified in a multitude of instances, as in the movements of cannon balls, discharged from ships moving in the same or some other course; while compound motions and equilibrium are successively illustrated in the interesting phenomena of the common kite. But for the universal truth of the principle, it is evident that, on a base already performing a motion so complicated as that of the earth, no dependence could be placed on the results of the application of forces for the various purposes of labor. If, however, any number of impulses may thus be replaced by a single equivalent, the converse must be true, and a single impulse may be replaced by two or more others having to it the

relation of components; or of any single force, a component in one direction may be neutralized by some pressure, while the other component gives rise to a motion in a third but related direction. In this way, when a ship sails by any wind not directly aft, resolution of the force of the wind must occur. In this separation of a single impulse into parts, we have resolution of the force or motion. To one or both of these principles are traceable all cases of curvilinear and reflected motions, and of rotation. With respect to its action upon any point not in the direction in which it is applied, the product obtained by multiplying the magnitude of any force by the perpendicular distance from such point to the line of such direction, is termed the "moment" of the force. The point taken is the centre of moments; the perpendicular distance is the lever arm of the force; and the product measures the ability of the force so applied to produce rotation about the centre of moments. The resultant moment of any number of forces situated in any manner in space, with reference to any straight line assumed as an axis of moments, is equal to the algebraic sum of the component moments with reference to the same axis. And again, if the system of forces applied to different points of the same body be parallel, the lever arm of their resultant, with reference to an axis at right angles to their direction, is found by dividing the algebraic sum of the moments of the forces by the algebraic sum of the forces. These principles lead us directly from the composition of forces to the principle of centre of gravity; while they also constitute one method of resolving the cases of the six elementary machines. II. *Centre of Gravity*. Each molecule of a coherent body has, of course, its own weight; but being restrained by cohesion, the molecules cannot fall or press independently. The soliciting forces or pressures on all the molecules may be considered parallel; and their direction is toward the centre of the earth. Hence, through every body, considered with reference to terrestrial gravitation, there will be a plane in a vertical direction, on the two sides of which the sum of the moments of the parallel pressures will be the same. The centre of all the pressures, that is, of the weight of the body, is evidently somewhere in this vertical plane. Now suppose the body placed successively in two other positions with reference to the vertical direction; for each of these there will be a different vertical plane, on the two sides of which the moments of pressure will balance. And since the centre of parallel pressures is in each of these three successively vertical planes, it must be at that single point in which the three planes will intersect. This point is termed the centre of gravity. A remarkable and important consequence now is this: since, into whatever position the body be turned, the moments of pressure on all sides of this point must balance each other, it follows that the entire weight of any body or rigidly connected structure whatever is in effect concentrated in the point in re-

lation to it now discovered; so that, in whatever position of the whole, if this point be supported, the entire body is supported, and is, with reference to the attracting body, the earth, at rest. In a single line of homogeneous particles, this point must be at the middle of its length; in any symmetrical and homogeneous surface or film of matter, it must be at the middle point, as in the centre of a circle, and at the point of intersection of the diagonals of a parallelogram. In any surface or solid the parts of which are symmetrical with reference to an axis, the centre of gravity is in that axis; hence, at the centre of a homogeneous sphere, and at the middle point of the axis of a cylinder or prism; while in the cone and pyramid it is at $\frac{1}{4}$ the length of the axis from the base. In irregular solids, the place of this point is found by trial. Suspend the body successively from three different points of its surface, and by an attached plumb line find in each case the direction of the vertical line through the body when it has come to rest; these three lines will intersect in a point, and this will be the centre of gravity of the body. The vertical line through the point of suspension of a freely hanging body, which has come to rest, must pass through this point, and also through the centre of the earth's mass. It is the line of the resultant of the action of all the particles of the earth and of the body mutually upon each other. This line is of course different for different points on the earth's surface; and it is known as the "line of direction." It is for any place the line in which a free body tends to fall, and in which a supported object, as a wall or structure, must press. Hence the obvious value of the indications of the plumb line, whose direction is at any place that of the line under consideration. The centre of gravity of any system of bodies, connected in construction, or separately placed in space, as the sun, earth, and moon, is readily found; and in cases of the latter kind it is often some point in free space. Join the centres of mass of any two of the bodies by a straight line, and the common centre of these two bodies will be in this line, at a point whose distances from the two centres of mass are inversely as the masses; join this point with the centre of mass of a third body, and at the point first found will be the combined weight of the first two bodies, and the distances of the new centre of gravity from this point and the centre of mass of the third body are found as before; and so proceed until all the parts or bodies are included. The common centre of gravity of the sun, earth, and moon lies far within the surface of the first of these bodies. A body so placed that the line of direction falls without the supporting base, must overturn or roll, and continue so to do until it can come to rest with this line falling within such base. If the support be at points or lines, as in case of the feet of the quadruped or of man, the base is the entire polygon of surface included by lines joining the extreme points, and hence is greater or less in different positions of these

supports. The stability of any body or structure is the relative capacity it has of resisting causes that tend to overthrow it. This stability, when present, is imparted by gravity, the very agent to which overturning is also due; the circumstance which determines the one result or the other is the position of the centre of gravity, and hence of the line of direction, with reference to the surface of support. A body or structure is more stable in proportion: 1, as the area of the base is larger; 2, as the base is more nearly perpendicular to the line of direction; 3, as the centre of gravity is lower; and, generalizing all these conditions, the body is more stable as, in order to overturn it, the centre of gravity must be lifted through a greater extent. It is the necessity of maintaining the stability of our own bodies, that controls all our postures and attitudes. Again, since support may be rendered to a heavy body in three ways, at the centre of weight, above, or beneath it, there are corresponding three kinds of equilibrium: 1, in the first case, neutral or indifferent equilibrium, the body resting in any position; 2, stable equilibrium, as in the case of the pendulum, which, if disturbed, tends always back to a state of rest; 3, unstable equilibrium, the body overturning upon the least deflection from the vertical. III. *The Laws of Falling Bodies.* The ancients looked upon rest as the natural state of bodies; and reasoning from the actual movements of the planets and of water when made to whirl, as well as led by a fancied perfection of the circle, they concluded that motions actually produced tend to take place in a circular direction. The true doctrine was possible only after arriving at the conception of bodies as wholly inert. Galileo, and still more clearly Newton, found the circular motion to be always due to at least two forces; and as one result flowing from such discovery, we arrive at the "first law" of motion, which may be thus expressed: Any body tends to persist for ever in the condition in which, whether of rest or of motion, it may be at the time; and if in motion, to advance continually at uniform speed and in a straight line. But a body free to move must have motion communicated to it by the smallest imaginable impulse; the velocity imparted when the impulse is a fixed quantity being directly proportional to the magnitude of the latter, and inversely as the mass acted on; or,

V varies as $\frac{F}{M}$. In the case of bodies gravitating toward the earth, however, F is not a fixed quantity; each new molecule in the mass acted on is attracted with the same energy as any molecule previously in the mass; so that the attraction increases always in the exact ratio of the number of molecules; $\frac{F}{M}$ is a constant ratio, and V therefore a constant quantity; or in other words, at a given distance from the earth's centre, bodies large or small must fall with the same velocity, not with velocities in proportion to their weights, as taught by the

early philosophers. This truth is proved by the familiar experiment in which, *in vacuo*, a guinea and a feather fall with the same velocity. In lat. 45° , at the sea level, and *in vacuo*, a body falling freely descends through 16.0847725 feet, or very nearly $16\frac{1}{2}$ feet = 193 inches, in the first second of time. But, gravity being, for distances from the earth's centre that are nearly the same, in effect a uniform or constant force, it is equivalent to a number of impulses repeated uniformly through the second. The body, starting at 0 of velocity, has its average velocity at the end of the first half second; hence, at the end of the second, it has double the average velocity of that period; hence, no new impulse being given to it, it would describe in the 2d second double the distance of the first, and, when the effect of the renewed action of gravity during this second is added, three times the distance of the first, or about 48 feet; and therefore, calling $16 = g$, in the first two seconds, $g + 3g = 4g = (2)^2 \times g = g.T^2 = 64$ ft. nearly. By pursuing the same line of reasoning, all the relations of spaces and velocities of falling bodies, for any required times, are readily deduced, as in the following table:

Time, in the order of seconds.	Spaces in successive seconds.	Whole times in seconds.	Spaces in whole times.	Velocities acquired at end of whole times.
1st.....	$g = 16\frac{1}{2}$	1	$16\frac{1}{2}$	$2g$
2d.....	$3g$	2	$64\frac{1}{2}$	$4g$
3d.....	$5g$	3	$144\frac{1}{2}$	$6g$
4th.....	$7g$	4	$257\frac{1}{2}$	$8g$
5th.....	$9g$	5	$402\frac{1}{2}$	$10g$
.....	$*$	$*$	$*$	$*$
10th.....	$19g$	10	$1608\frac{1}{2}$	$20g$

&c. An inspection of this table will at once show certain laws of the spaces and velocities, all that are ordinarily required of which are expressed in the following formulas. Calling the space described in the first second g , the whole space H , the time in seconds T , and the velocity V , then $H = g.T^2 = \frac{V^2}{4g}$; $V = 2g.T = 2\sqrt{g.H}$;

$T = \frac{V}{2g} = \sqrt{\frac{H}{g}}$. When a body is projected downward, the uniform movement due to projection is added to the uniformly accelerated motion due to gravity; and calling h the space moved through in consequence of projection in each second, the whole space described in a given time is, $H = g.T^2 + h.T$. When a body is projected upward, gravitation acts as a uniformly retarding force; hence, theoretically, such a body must rise to the same height as that through which it would have to fall, to acquire a final velocity equal to the initial velocity of projection; it will lose $32\frac{1}{2}$ feet of velocity in each second; and generally, the relations of spaces and times already found will hold true of its motion, in the reverse order. The same laws serve for the case of a body rolling down or projected up an inclined plane; the unit, however, or descent from a state of rest in the first second, is different, being such part of g as the height of the incline is of its slant length.

Into the theory, as now stated, some disturbances enter, chiefly those due to resistance of the air and the revolution of the earth. By the first cause, the velocity of fall is lessened, and the time prolonged. A ball of lead was found to be $4\frac{1}{2}$ seconds in dropping from the lantern of St. Paul's to the pavement, a distance of 272 feet; while by theory it should have fallen 324 feet in the same time. As the speed of fall is augmented, so also is the resistance of the air; the result being that a sphere of lead $\frac{1}{4}$ inch in diameter cannot attain to a velocity greater than about 117 feet per second; a like drop of water 86 feet, and a sphere of cork 18 feet. Falling rain and hail are thus limited to a comparatively moderate velocity. A body projected upward does not rise to the height indicated by the theory; and yet it is longer in falling than in rising. To a like cause, as well as to the fact that our impression of the speed acquired during falling is usually erroneous—such speed increasing, not as the whole height, but in the less ratio of the double of the number of seconds—and in part also to other influences, is due the impunity, sometimes quite astonishing, of a certain proportion of the cases of persons, especially children, falling from considerable heights. Again, owing to the revolution of the earth, a body let fall deviates from the vertical, in the northern hemisphere, slightly to S. E.; in the southern, to N. E.; while a body projected upward lags somewhat, and falls, north of the equator, to S. W.; south of it, to N. W. IV. *Projectiles*. A heavy body discharged in any direction through a medium as the air, is a projectile. The fundamental fact of the theory of such motions is, that the projected body, flying through the air with any velocity whatever, perfectly obeys in and for the same period of time the laws of a falling, or, as the case may be, of an ascending body. The projectile is acted upon by gravitation, in precisely the same manner as if dropped from a state of rest. Hence, the air being supposed removed, a ball fired horizontally from the top of a tower 257 feet high, will reach the ground in precisely the same time, whether the horizontal velocity be less or more; namely, in 4 seconds. The projectile, therefore, advances along a curve, the horizontal distances of which for as many seconds, i. e., the abscissas, are 1, 2, 3, 4, &c.; while the vertical distances measured from above, i. e., the ordinates, are $1^2, 2^2, 3^2, 4^2$, &c. But any curve so determined is a parabola; and this, in whatever oblique direction the discharge, is in theory the true geometrical character of the path of a projectile. The horizontal distance of flight is the range or random of the shot; the angle the axis of the gun makes with the horizon, is the elevation. To Galileo, who first developed the effect of a uniformly accelerating force, and the law of a falling body, we owe also this first and most obvious deduction—the theory of projectiles. From known relations of parts of a parabola, he deduced the following consequences: the range is

a maximum when the elevation is 45° ; and for equal deviations above and below, say for 70° and 20° , the range is equal; incidentally, therefore, the higher elevation is preferable when obstacles, as walls, intervene; the time of flight is increased as the elevation is greater; and this, as well as the height reached, is a maximum when the projection is vertically upward; and finally, fired at any elevation, a body can only remain in the air a given time, and hence, to fly further, should receive a greater initial velocity. The theory, thus developed, is useful as a basis only; the business of loading, and taking aim, so as to secure the desired execution, is largely modified by considerations such as the resistance of the air, and the nature of the materials at command; and thus modified, constitutes the practical subject of gunnery. It may be added here, however, that the principles remaining most nearly true in practice, are those relating to greatest height, time of flight, and, within certain limits, the increase of range by increase of velocity. When we remember that the action of moving air has overthrown strong edifices, and lifted and transported very heavy bodies, even cannon and rocks, it will be evident that the reaction of air at rest against balls or bullets flying at a speed greater than that of the most rapid tornado, must be enormously great. A speed of projection however great is thus very soon reduced to one of less than 1,100 feet per second; and the actual path of the ball is in a curve deviating within the parabolic, and more rapidly at the last, and called the ballistic curve. For the explanation of the deviation of projectiles to the right, in consequence of the rotation of the earth, see *GYROSCOPE*. This deviation, in a ball fired due south 5,600 yards, has been observed as amounting to nearly 11 yards. *V. Rotation and Centrifugal Force.* For the nature of rotation, composition of rotations, and the gyroscope, see *GYROSCOPE*. If a disk or globe be turned, since all circumferences are as their diameters, and hence as their radii, it is obvious that a particle so far from the axis of rotation as to have its radius twice that of some nearer particle, will during a revolution or any part of one describe an actual path just twice as long as that of the nearer particle; one at three times the distance, a path three times as long, &c. Thus, while the actual velocities of the particles will increase as their radii, the ratio of any such velocity to the corresponding radius remains always the same; this constant ratio of velocity to radius, in a turning body, is called the angular velocity, expresses its velocity as a whole, or at a unit of radius, and may be marked V_1 . To this quantity are directly related the moment of inertia of a rotating body, and hence also its living force or quantity of action, the work of a force expended in bringing into rotation at any given rate a mass of known magnitude and form, and the quantity of moving force such a mass so rotating can accumulate, and which, as in a fly-wheel, it can again expend in overcoming

irregularities of movement of machinery, or in performing direct labor, as of coining, shearing and punching metallic plates, &c. Any body or parts of a body describe a circular or elliptical movement only when, having received an impulsion or projection, the moving mass is at the same time drawn or restrained toward a centre or axis of motion, by cohesion of the mass itself or of a connecting cord, or by gravitation, as in the case of the planets, or by the cohesion of a rigid, confining surface without. If the attraction or other restraining force be suddenly removed or overcome, the released body or fragment moves onward from the moment in a straight line, which therefore is tangent to its curvilinear path at the point. Now, since any body tends in virtue of an impulse, momentary or repeated, to move forward in a straight line, its inertia, in which this tendency inheres, becomes in effect a continual pull or reaction outward, or against the restraining force which is at every moment deflecting it into a curved path. The original impulse, tending to give motion in a right line, is the projectile force; the restraining gravitation or cohesion, which deflects the body into a curved path, is the centripetal force; the reaction against this force in a precisely opposite direction, due to inertia, and tending to tear the body outward in a radial line from the centre or axis, is the centrifugal force, so called, but which, being only a reaction, is not a force, and would be more properly named centrifugal pressure, or centrifugence. As an action and a reaction, the centripetal and centrifugal pressures are necessarily equal; or if not so, the path ceases to remain circular. In the case of a whirled ball or turning mass, the centripetal force is seldom the whole cohesion, but is only such part of it as is called into action by the amount of outward pull or pressure, while this latter bears a close relation with the whole momentum imparted by the force of projection. When the centripetal action has been in any way overcome, the force with which the body then moves off in a tangent to its curvilinear path is identical with the original force of projection, or with such part of it as remains; it is sometimes named the tangential force. The centrifugal pressure, C , of a mass M , revolving with an effective radius R , is $C = \frac{V^2}{R}$; and in terms of gravity, the weight being W , $C = \frac{W}{g} \cdot \frac{V^2}{R} = \frac{MV^2}{R}$. In a turning body, the number of revolutions in a given time being N , $C = \frac{2\pi^2}{g} \cdot W \cdot R \cdot N^2 = 1.2275 \cdot W \cdot R \cdot N^2$. And generally, for any whirled body, C varies as the product $W \cdot R \cdot V_1^2$; that is, as the weight of the body, into radius, into the square of the angular velocity. Familiar illustrations of centrifugal pressure are numerous; as, in the hurling of stones from a sling; the tendency of the rider in a circle, or of a carriage turning a corner, to be overthrown outward; the bursting and projection of grindstones or wheels too rapidly turned; the dishing outward and upward of the water to-

ward the edge of a whirlpool; and the meandering of streams which, deflected from one bank, are then borne against the opposite. Important applications in mechanism are seen in the machinery for sugar drying, in certain blowing machines, for furnaces, ventilation, &c., and in various forms of centrifugal pump. **VI. Oscillatory Motion; the Pendulum.** If a suspended body have its centre of mass drawn aside from the vertical line through the point of suspension, and be then released, it is by gravitation caused to move back to such vertical; but in thus descending it has acquired a momentum which, were there no impediments to the motion, must carry it through exactly the same distance on the opposite side, when it would be brought to rest, and return; and this movement would be repeated indefinitely. The movement consists in an excursion and return, through a circular arc, larger or smaller; it may be considered as a partial and alternating rotation; and it is termed oscillation, or vibration. The excursion and return constitute a double oscillation; either one of these, a single or simple oscillation; the point from which the swinging mass is suspended is the centre of suspension; the length of arc described is the amplitude, and the period in which it is described, the time, of an oscillation. Generally, the velocity acquired by a body descending, without friction, a curve vertically placed, equals at any point that which would be acquired in falling freely through the vertical depth of the curve to the same point; the time of descent depends on the nature of the curve. Now, in a circular arc, the time of vibration increases measurably when the amplitude increases; though by an extremely slight amount, until after the arc is made to exceed 2° . To obtain isochronous (equal-timed) vibrations, some other curve must be resorted to; and the cycloid, among other singular properties, has that also of causing an unresisted movement through its whole extent to occupy precisely the same time with an oscillation through any less arc of the curve, at its lowest part, and greater than 0. The importance of this problem of obtaining isochronous vibrations has arisen out of the use of a vibrating rod and ball—the pendulum—for dividing and indicating time, especially in nice philosophical investigations. The pendulum, as used, is distinguished as the actual or material pendulum; a true oscillatory motion would be exemplified by a single heavy particle at the end of a line destitute of weight, and this theoretical conception is spoken of as the mathematical or simple pendulum. The evolute of the cycloid consists of two reversed semi-cycloids, termed in practice the cycloidal cheeks. The line unwrapping from and wrapping upon these, the heavy particle moves in a cycloidal arc. The length of rod is just double the diameter of the generating circle. Now, from relations of parts of the cycloid it is shown, that the time of falling down the semi-cycloid is to the time of fall through the diameter of the generating circle, as quad-

rant of a circle to radius; that is, the time of a half vibration is to the time of falling down half the length of the pendulum, as the semi-circumference of a circle to its diameter; or,

$$\frac{T}{2} : \sqrt{\frac{L}{2g}} :: \frac{\pi}{2} : 1; \text{ whence, } T : \sqrt{\frac{L}{2g}} :: \pi : 1; \text{ and}$$

$$T = \pi \sqrt{\frac{L}{2g}}.$$

From this expression either the time or the length of the pendulum is obtained, when the other is known. As a consequence of the relation shown, also, π and $2g$ being constant, T varies as L ; that is, for the cycloid, the time of vibration depends on the length of the pendulum only, and is independent of the length of arc. Again, for different times, the lengths will vary as the squares of the times; so that, the length of a pendulum vibrating seconds in New York having been found by careful determination to be 39.10158 inches, that beating tenths of seconds must be about .891 inch long; beating once in 2 seconds, 156.4 inches; and so on. The practical length of a pendulum is the distance between the centre of suspension and another point theoretically determined as follows: If a uniform homogeneous rod be made to swing, the particles above the middle of its length tend to vibrate in less times than one at the middle; those below in longer times. But the whole quantity of action in the lower is also greater than that in the upper half, and the parts are by their cohesion constrained to move together; hence, at some part of the length of the rod there must be a particle that, owing to the length of the rod above it, would if alone vibrate in the same times as the whole rod actually does. In the rod supposed, this is at $\frac{1}{2}$ the whole length below the centre of suspension; it is the point in which the whole moving force of the swinging rod is concentrated, and hence is called the centre of oscillation. The effective length of every pendulum, now, is the distance between these two centres; and for convenience we lower this point, which is always below the centre of gravity, as much as possible, by collecting the matter of the pendulum mainly in a ball at its lower extremity. The inconvenience of the contrivance for securing cycloidal arcs has led to a return in practice to those that are circular; and this is the more readily done in view of the fact that oscillations in very small circular arcs approach almost exactly the cycloidal; while the elasticity of the thin tongue or ribbon of steel inserted to form the upper end of the rod, may be made to compensate the slight retardation, and secure almost absolute isochronism. Any weapon or implement, as a club or axe, which is swung, is in effect a pendulum; the point in which its moving force is concentrated is termed the centre of percussion, and is identical with that of oscillation. In order to exert upon the object struck the full effect of the blow, the impingence must be in the line of motion of this point; otherwise, part of the moving force remains unexpended, tends to rotate the weapon,

and inflicts a blow on the hands. VII. *Reaction, Momentum, and Collision of Bodies.* An invariable experience assures us that we cannot exert force upon that which opposes to such force no resistance. A blow is only possible when and to the extent to which the body struck inflicts on that striking it a counter blow. The body that attracts is equally attracted, and there is no push or pull actually applied save by means of an equal push or pull in return. This is as true when the body moves under the impulsion, as when it remains at rest; it will move only when and as its capability of acting against the force applied is less than the capability of action on the part of the force; but, in moving, it still acts back to the amount of the impulse it really experiences. The truth here discovered was generalized by Newton in the "third law" of motion, viz.: that to every action there is opposed an equal reaction; and this law holds alike for cases of pressure, collision, attraction, and repulsion. Unless, indeed, as now shown, force always pulls or pushes against force, there would be no fixed point, or point of application, and no effect. Aristotle had a glimpse of this principle, when he wrote: "Neither very small (light) nor very large (heavy) bodies can be thrown far;" adding the suggestion that the large body reacts so greatly, the small one so little, that there can be no throw or push. Yet Arriaga, as late as 1689, was troubled to know how, when several flat weights lie one upon another on a board, any but the lowest should exert pressure on the board; and Cardan about the same time puzzled himself with the question: "If two men each draw half a weight, should they not together draw $\frac{1}{2}$ of $\frac{1}{2} = \frac{1}{4}$ of the weight?" In another view, the law of reaction may be thus expressed: every change produced consumes the changing force; hence, in the disappearance of the acting force, the apparent rebut. The shock felt in a body arrested when in motion, is not so much a shock given to it by the body stopping it, but rather that arising by its own surrender of moving force, and stopping in consequence. Examples of action and reaction are numerous and familiar; none show the nature of the case better than that of a person pulling a boat in which he may be to shore; if the other end of the rope be attached to a post, this must pull in the opposite direction with the same force that he applies; for if a second man now take the place of the post, though the boat is moved only as rapidly as before, yet if the latter do not exert himself just as much as the former is doing, the movement of the boat flags, and the workman on shore is drawn into the water. The quantity of motion in a moving body, as indicated by the instantaneous blow it will impart to another movable object, is called the moving force or momentum, m , and its measure is $m = MV$; so that the momentum of a body is doubled by doubling either the mass or the velocity, and quadrupled when both these are doubled. The effect of momentum of a solid

body is seen in the blow of a cannon ball, and in the force with which a ship under sail strikes a rock, or crushes a small boat against a wharf; of a liquid body, in the energy imparted to water wheels, and in the devastation of torrents; of the air, in the impulsion of windmills and sailing ships, and the resistless sweep of the tornado. But while the measure of the power to inflict a momentary blow is that already stated, the case is different where the moving body has time to expend on the obstacle the whole work of which it is capable. It is then found to give a quantity of effect, which varies as the product, not of M into V , but into V^2 . But a body cannot thus restore more force than it has previously stored. Hence, to overcome all the inertia of a body moving with a certain velocity, or to impress on it at rest such velocity, the same whole quantity of action must in either case be exerted, and expended upon the body; this quantity of action is measured by $Q = \frac{1}{2}MV^2$; it is equal to the whole work exerted by gravity upon a body during its descent through the space through which it must fall freely to acquire the given velocity V , and hence, to the whole of the constant effort that must be exerted to uphold the body against gravity during the corresponding time; that is, again, to the work expended in moving a working point against a uniform equal resistance during the same time. Either of the three quantities last stated is a certain weight W , overcome through a certain height or distance H ; hence, for any one of these cases, $WH = \frac{1}{2}MV^2$. The quantity which is commonly known as the living force impressed during a certain action, or the *vis viva*, L , is the double of the quantity now found; or, $L = MV^2$. It is through an oversight of the necessary truth, in mechanics, that no body or machine can restore or expend a greater amount of force than it has been previously allowed to store or accumulate, or that no machine can within itself originate any moving energy, that the greater number of those predestined failures or frauds known as "perpetual motions" are undertaken. In the collision of inelastic bodies, both movable, one law properly interpreted covers all the cases: after collision, if their impact be in the line of their centres, and their moving forces equal, the bodies will both come to rest; if their moving forces be unequal, the motion will continue in the direction of the greater, and will be represented in velocity by the quotient obtained by dividing the algebraic sum of the momenta by the sum of the masses; or, $V' = \frac{MV + M'V'}{M + M'}$. So, all cases in which equal and perfectly elastic masses meet in their line of centres, are included in the single law, that the bodies, after impact, interchange velocities. VIII. *Elements of Machinery.* The necessity of overcoming a variety of mechanical resistances has confronted mankind from the earliest times; muscular power and certain external agencies quite as obviously presented themselves as the means.

But many of the resistances are too great to be thus directly attempted, or the power at hand is not in a form suited to them; hence the need of devices or contrivances for modifying the power or its effect. These, if highly simple and obvious, so as to partake but slightly of the character of machines, constitute tools; as a knife, a hammer, &c. On the other hand, if we thrust a long inflexible bar against an obstacle, or pull on it with a rope, the force exerted at one point is made available at a distant one. So, with a bar and prop suitably arranged, we overturn or lift a body of great weight; the power is exerted to unexpected advantage. Here discovery and ingenuity are more distinctly involved; and the result—a machine proper—we may define to be any contrivance by which the effect of a force is transmitted, being usually also, within a given time, augmented, diminished, or otherwise modified to the advantage of the user. In respect to their purposes, machines have been variously classified, but perhaps never completely. Rankine names two general divisions—machines for observing, and for work. Among the former are those for counting, measuring, copying or drawing, weighing, recording, &c. Working machines are those for: 1, lifting and lowering solid weights; 2, horizontal transporting of weights; 3, projecting of solid bodies; 4, lifting of fluids; 5, propelling or projecting of fluids; 6, dividing of solid bodies; 7, shaping of bodies by cutting; 8, shaping by pressure; 9, uniting materials into fabrics; 10, printing; 11, producing of sound; 12, miscellaneous purposes. In their relations to power and motion, the uses of machines are: 1, for transmitting force; 2, changing the direction of its action; 3, increasing or diminishing the velocity of movement, as in wheel work; hence, 4, prolonging action of the power, as in the watch; 5, changing the intensity of the effect, as with compound levers and pulleys; 6, changing the kind of motion, as from a rotating to a reciprocating (forth and back) movement, or some other; hence, 7, reducing the time of labor, as with the locomotive; 8, determining the nature of the effect to be produced, as is done by the last piece in mills, factories, &c.; hence, 9, insuring accuracy and uniformity of effect, as in the use of lathes. In every machine, a certain moving power or motor, the amount of application of which during a given time is P , is brought to act, at the point of application, on the first piece of the machine, called the “receiver” or “prime mover;” from this transmitted through various connections, communicators, to the last piece; this, urged directly against the resistance, is the “working part or piece;” the point at which it acts on the resistance is the working point. At such point, or collection of points, the resistance, weight, or load is moved or overcome; its amount is W . If a horse draw a load, the uniform or the average pull, as shown by the dynamometer, against friction and all resistances, being supposed 120 lbs., and through a distance of

50 feet, he performs precisely the work that, similarly harnessed and walking over the same ground, he must perform in elevating from a pit by a rope over a fixed pulley, and supposed to move with no loss from friction or other cause, a weight of 120 lbs. through 50 feet height against the pull of gravity. Properly averaged or summed, the total work of every machine is of like nature, and measurable in like units, whether the resistance be weight, cohesion, inflexibility of materials, friction, or any combination of these. Thus, “mechanical work” consists in moving against mechanical resistance. The capacity of any motor for performing such work is termed its “energy;” the amount of energy at any instant exerted upon the machine is the “effort.” Hence, the mechanical work done upon or through a machine is, universally, the product of a certain mean effort into the length of path through which the effort is exerted, equal to $W.H$, as found in the preceding section. The unit of work, or the unit of power, adopted by mechanists and engineers employing the English language, is one pound weight (avoirdupois) of matter raised without friction through one foot against gravity, termed a foot-pound, and which may be expressed by $p.l.$ The average power of man has been estimated at 100 $p.l.$ per second = 6,000 $p.l.$ per minute = 2,880,000 $p.l.$ for 8 working hours per day. The average power of a draught horse has been taken (probably too large) at 550 $p.l.$ per second = 33,000 $p.l.$ per minute; and this quantity, as a larger unit, used in estimating the power of water wheels, steam engines, &c., is termed a horse power. The French horse power, or *cheval-vapeur*, equals 32.562 $p.l.$ per minute; while the *dynama*, equal to 1,000 *kilog.* \times 1 *mètre* = 7,232.4 $p.l.$, has been proposed. The principal motors are: 1, man, acting by muscular power or by weight; 2, quadrupeds, do. do.; 3, water, by momentum or weight; 4, wind, by momentum; 5, weights, so called; 6, springs, by elasticity; 7, steam, and other aëriiform bodies, by expansive or elastic force; 8, electro-magnets; 9, the electric discharge or current, &c. All these find their origin in muscular contractility, gravity, and certain simple attractions and repulsions of the neighboring molecules of bodies. Animate motors exert their power to very different advantage, when the direction of action or other conditions are different. Quadrupeds are less serviceable in carrying than in drawing burdens; least of all, in carrying up or down a considerable slope. The horse works to best advantage in pulling nearly horizontally, walking straight forward, or, if in a circle, of not less than 20 feet radius. The work of carrying and of traction can hardly be compared; in the latter, a good day's work of a horse drawing a cart and load has been estimated at 12,441,600 $p.l.$ A horse may be so loaded that no motion is possible; or his speed may be made the utmost possible, and then he can carry no load. In either case, no work proper is done; there

must be some intermediate speed at which the work (product of resistance into length of path) will be a maximum; and as a rule, this occurs at 4 miles an hour. In carrying loads on his shoulders or up a hill, man becomes relatively superior to the quadrupeds. He exerts his strength to least advantage when reaching up and pushing or pulling horizontally above his head, or when dragging a barge or sledge by a rope over his shoulder; and to the best, when, being nearly erect, he lifts upward, or when seated, he pulls from the direction of the knees, as in rowing. If we call a fair working effort of man 75 *p.l.* per second, that of the ass is about 180, of the ox 300, of the mule 350, and of the draught horse 480, for the same time. The best continued practical working effect of animate motors generally, if the effort be in any degree severe, is obtained when the working hours do not exceed $\frac{1}{4}$ of the 24.—The whole power applied during a given time to any machine, is necessarily equal to the total resistance overcome, or work done, in and through such machine, during the time of expenditure of such power; or, universally, $P.H. = W.H.$ A man whose effort is 75 *p.l.*, can raise so many pounds through 10 feet in 10 seconds; he cannot move at all a load of 600 lbs. But if to this latter load he attach a pulley, supposed frictionless, of 8 cords, he will be enabled to move the load to such extent as will be due to his pulling and taking in 10 feet of the rope per second. His working effort will here as before be 75 *p.l.*; but in order to move the load through 10 feet, he must now exert this effort through 80 feet, in taking in so many feet of rope. If, then, there be no loss, he does the whole work; but is conveniently enabled to lessen the effort required down to his own capability, by distributing it over a longer period. That is, theoretically, the power and the load always move or act, or in case of balancing would do so if movement actually occurred, through spaces or with velocities that are inversely as their own magnitudes. This law, known therefore as that of “virtual velocities,” or of “equality of moments” of the power and load, and familiarly expressed by saying that what is gained in power is lost in velocity or in time, is, calling v the velocity of the weight, and V that of the power, formulated thus: $P : W :: v : V$; and this expresses the condition of equilibrium, for rest, of the power and resistance. Hence, the “mechanical advantage,” or theoretical gain of power of a machine, known also as the velocity-ratio, is $\frac{W}{P}$ or $\frac{V}{v}$. But in every actual machine, in operation, there will occur more or less both of necessary loss and waste of the power applied, chiefly owing to friction, and in a less degree to the imperfect flexibility of cordage, bands, &c., and to the resistance or adhesion of the fluid medium in which the parts move, and usually augmented by imperfections in the mechanism itself, and in the expenditure of the effort at the working point. The total loss due to these

causes being subtracted from the total work of the power, the remainder is the useful resistance overcome, or useful work performed. Calling this U , it follows that $\frac{U}{P}$ is the ratio of practical efficiency, and it is called the *modulus* of the machine.—Machines are either simple or complex. The simple machines are commonly known as the “mechanical powers,” a very inappropriate term, better replaced by that of elements of mechanism, or elementary machines. Of these, six are usually named: the lever, wheel and axle, pulley, inclined plane, wedge, and screw. The simplest lever is an inflexible bar, propped at some point in its length, and about which it turns; but the modifications of form and appearance are almost without end. The prop is called the fulcrum; measuring from this to the points of application of the power and the weight upon the bar on the two sides, we obtain the lengths of the arms; calling these A and a , $P : W :: a : A$; so that $\frac{A}{a}$ is the mechanical advantage, or leverage, or ratio of weight to power, required to produce equilibrium. Archimedes properly also explained the lever, by regarding the fulcrum as at the centre of parallel pressures. Levers may be straight, angular, or curved; the power and weight may act at any angles. The universal rule is that P and W balance when they are inversely as the lengths of two lines let fall from the fulcrum perpendicularly to the lines of direction of the action of P and W , respectively. Levers are of three kinds, according to the relative places of the power, weight, and fulcrum F , as in the following systems: 1, $P F W$; 2, $P W F$; 3, $F P W$. Examples of the 1st kind are, the handspike, crowbar, steelyard, balance, pump handle, the shipper handle of locomotives, scissors, pincers, or forceps; of the 2d, the crowbar in lifting, the oar, rudder, slicing knife, hand barrow, nut crackers, or any pole or bar sustaining a load, with power applied at both ends, which is the case of the whiffle-tree; of the 3d, the fishing rod, common safety-valve bar, tongs, or pliers. The first kind of lever may have its arms such as to involve either a gain or a loss of power; the second always affords a gain; the third, always a gain of velocity, at the expense of power. The gain in the compound lever is obviously found by compounding the ratios of the several single levers in it. The wheel and axle consists of a large and small wheel or cylinder rigidly joined so as to move together, and to opposite sides of which respectively the power and load are applied by a winding and an unwinding rope. The common axis is the fulcrum, the respective radii are the lever arms; so that this is a perpetual lever, the gain of power being invariably in the ratio of the radii, or $\frac{R}{r}$. In practice, this device is greatly modified, giving us the steering wheel, or wheel with or without pins in its periphery, as for working brakes and a variety of purposes,

the crank, windlass, capstan, windmill, tread-wheels, lathes, water wheels, in fact all wheel work. The pulley consists of one or more small wheels, turning by means of a cord or rope within a block. The small wheels are sheaves; by workmen the system is termed a block and tackle. Any fixed pulley or set of pulleys affords no gain of power, but serves only to change the direction of its action. The load suspended from a movable pulley bears equally on all the effective parts of the cord, the number of which is double the number of movable pulleys, or $2n$, save that, when the end of the rope is attached to the movable block (the most effective arrangement), it is $2n+1$. In these two commoner forms, the mechanical advantage is therefore, in theory, $\frac{2n}{1}$, and $\frac{2n+1}{1}$. Various peculiar arrangements, such as the Spanish barton, are resorted to with increased gain of power in particular cases. The inclined plane is a rigid surface sloping at any angle between the horizontal and vertical. The weight of any heavy body or load, placed on a plane so situated, and of course acting vertically downward, is necessarily decomposed into two pressures—a normal component, acting at right angles to the plane, and upheld by it, and a component parallel with the plane, which is the amount of tendency remaining, by which the body can roll or slide down the plane. These components, h and l , are geometrically shown to have to each other the ratio of the height of the plane to its length. The ratio of the weight to the power acting parallel with the plane, required to secure equilibrium on any such plane, is therefore $\frac{l}{h}$. When the power acts parallel with the base, b , the gain of power becomes less, being in the ratio $\frac{b}{h}$. The uses of the inclined plane are familiar; among them are the slopes employed for launching ships, and the inclines or gradients of railways. The wedge is essentially an inclined plane intended to move, so as to advance against or beneath the load. Much difference of opinion has unnecessarily arisen in respect to the theoretical gain of power in this instrument. Being a moving inclined plane, and in all cases, whatever its actual form or action, in effect a single-sloping body advancing between a fixed resistance on one side and a movable one on the other, its "height" is always equal to the width of its whole back; so that the gain is, in the same cases as above, either $\frac{l}{h}$ or $\frac{b}{h}$, l being its slant length, h its whole back, and b its length in the direction of an axis or base. It is practically difficult to estimate the peculiar kinds of work done by the wedge. Most cutting and sawing implements are among the examples of it. The screw is a cylinder worked by a lever, and having upon it a winding inclined plane, the thread, along which, in effect, the load is always made to advance, being applied by means of a fixed or movable nut, or corresponding hollow screw. While the power at the end

of the lever sweeps through the circumference C , determined by its length as a radius, the load is moved through the vertical distance d , between the corresponding sides of two adjacent turns of the thread. Hence, always, the gain of power is in theory $\frac{C}{d}$, a ratio that may become enormously great. The uses of the screw are familiar. Thus, the so called six are really resolved into two elements of mechanism, the lever and inclined plane. But beside the six now described, there are other devices which scarcely come under any of them; as the knee lever (knee joint), eccentrics, and cams of great variety, unless, indeed, all three of these are resolvable into the wedge with variously curved surfaces; and beside these, Hooke's joint, &c. The practical loss of power in the various simple machines varies, from a very small percentage in the simple lever and wheel and axle, to $\frac{1}{4}$, $\frac{1}{3}$, or $\frac{1}{2}$ the entire power applied, as in compound pulleys and the screw; while in the latter the loss is often, and in the wedge usually, greater than the entire acting load. As a necessary consequence of the loss arising in all machines, when put in motion, the power must always exceed that theoretically found, namely, that which gives equilibrium in the state of rest. If, of the power P required in any machine to balance the load at rest, a part Y is lost, the remainder is U , the useful work; $\frac{U}{P}$ is the part of the theoretical power that takes effect. Hence, to find the practical power necessary to maintain the machinery in motion at a certain speed, it is necessary first to find the value of P by theory, then to find the loss Y at the required speed, to subtract this from P , finding U , and then to increase the power already found in, or to multiply it by, the ratio $\frac{P}{U}$. This will give the practical power required for the given load and speed, and uniform movement at such speed. If the velocity be increased, the loss increases; and the reverse.

MECHELN, or MECKENEN, ISRAEL VON, the name of a German engraver and goldsmith, or according to some of two engravers, father and son, who were probably born in Mecheln, Westphalia, and flourished in the latter half of the 15th and the commencement of the 16th century. From the difference observable in the style of the prints passing under the name, of which upward of 300 are known, it is almost certain that there were two artists named Von Mecheln who practised engraving. Their works are among the earliest specimens of the art. About the latter half of the 16th century flourished an artist of the school of Cologne, whose name has been lost, but to whom, says Kugler, "formerly, though without sufficient ground, that of a contemporary goldsmith and engraver, Israel von Mecheln or Meckenen, was given." He is generally designated as the "master of the Passion," from his chief work, a representation of the Passion on 8 panels. Several other works

by the same hand are extant in Germany, painted in the stiff, Gothic style, with something of the manner of the Van Eycks. By some this unknown artist is supposed to have been identical with Israel von Mecheln the younger.

MECHERINO. See **BRCCAFUMI, DOMENICO.**

MECHI, JOHN JOSEPH, an English agriculturist of Italian extraction, born about 1800. His father removed in early life from Rome to France, and thence to England, where he became attached to the royal household. The son, on account of his proficiency in modern languages, obtained employment in a mercantile house. For the last 25 years he has been engaged in the cutlery and hardware business, and has establishments in various parts of London. "Mechi's magic strop" and liberal advertising have been his passports to fortune. He was elected alderman, and in 1857 was senior sheriff of London and Middlesex. His reputation is however principally owing to his experiments in scientific agriculture on his estate of Tiptree Hall in Essex. He collects the manure in a vast reservoir, liquefies it, and distributes it by a steam engine, through subterraneous pipes over all parts of the farm, which it fertilizes and irrigates at the same time. He has written "Experience in Drainage," "Letters on Agricultural Improvement," and "How to Farm Profitably, or Sayings and Doings of Mr. Alderman Mechi" (London, 1859).

MECHITAR, the founder of a congregation of Armenian monks, called after him Mechitarists, born in Sebaste (Sivas) in Armenia Minor, died April 27, 1749. The name Mechitar (also written Mehitar or Mochtar), which signifies "comforter," was given him on entering a convent of the Antonian monks; his original name was Manuk. He showed in early life an insatiable thirst for knowledge, and a desire to elevate the literary culture of his people to a level with that of the most educated nations of Europe. For this purpose he laid the foundation of a new religious congregation at Constantinople in 1701. The persecution which he and his congregation had to endure on the part of the Armenian patriarch, on account of their union with Rome, induced him to send a number of his disciples to the Morea, at that time belonging to the republic of Venice, from which the congregation received in 1703 permission to build a church and convent at Modon. In 1715, when a war between Venice and Turkey had broken out, Mechitar went, with 11 of his disciples, to Venice, whither the rest of the congregation, about 70 in number, followed him in 1717, after the capture of Modon and the destruction of the buildings by the Turks. The government of Venice gave to the congregation possession of the island San Lazaro, near Venice, "for all future times." Here the congregation soon began to prosper beyond expectation. The Mechitarists take the usual monastic vows, and pledge themselves to go wherever their superiors may send them, and to labor especially for the advancement of a Christian Armenian litera-

ture. The merits of the Mechitarists in this respect are very great. They have not only furnished the best editions of all classic Armenian writers, but also translated a number of standard works of European literature into the Armenian language. Not only Catholic literature, but even works like Ranke's "History of Germany during the Reformation," appear in the list of their publications. Among the most valuable original works composed by them are a "History of Armenia," by Father Tchamtchenanz (died 1823), in 8 vols.; and a "History of Armenian Literature," by Father Somal, abbot of San Lazaro (Venice, 1829). From San Lazaro the congregation have spread to all countries in which Armenians reside, in particular over Italy, Austria (5 houses), Turkey (4 houses), Russia, and Persia. Next to San Lazaro, their most important establishment is that of Vienna, founded in 1810, which has devoted itself to the publication of German Catholic books, and from 1830 to 1850 issued 445,989 volumes. A legacy of a rich Armenian in Madras enabled them to establish a learned institution in Padua, principally for the education of young laymen, as the school of San Lazaro serves mostly for the education of Armenian clergymen. In 1846 they founded a college in Paris, which has already a high reputation.

MECHLIN, or **MECHELEN** (Fr. *Malines*), a Belgian city, in the province of Antwerp, on the Dyle, 12½ m. N. by E. from Brussels, 88 m. E. by S. from Ostend, and 137 m. W. from Cologne; pop. about 30,000. It is the great railway centre of Belgium, the chief lines radiating from the town, which however presents a deserted appearance, vividly contrasting with the bustle at the station, which is ½ m. outside the gates. Mechlin is one of the most picturesque Flemish cities, Kraam street and most other streets abounding with quaint houses and numerous signs over the shops. The Place d'Armes is a very large and handsome square. In the Grande Place is the cathedral and a statue of Margaret of Austria by Geefs. The principal public edifices are the cathedral, the massive, unfinished tower of which is 348 feet high, the churches of Notre Dame, St. Peter and St. Paul, St. John the Baptist, and St. John the Evangelist; the archiepiscopal palace; the Beguinage, an asylum for aged widows; and the college. There are manufactories of woollens, linens, lace, beer, &c. The lace manufacture, formerly celebrated, has greatly fallen off both in quantity and quality. Mechlin is the seat of an archbishop, who is primate of Belgium, and has authority over 8 suffragans. Its churches contain some fine paintings by Rubens and Vandyke.

MECKLENBURG. I. A S. E. co. of Va., bordering on N. C., bounded N. by the Meherrin river, intersected by the Roanoke and drained by its tributaries; area, 640 sq. m.; pop. in 1850, 20,630, of whom 12,462 were slaves. The surface is undulating and well timbered, and the soil generally fertile. The productions in 1850 were 118,016 bushels of wheat, 552,466

of Indian corn, 4,863,184 lbs. of tobacco, and 25,655 of wool. There were 8 grist mills, 10 saw mills, 4 tanneries, 30 churches, and 574 pupils attending public schools. Value of real estate in 1856, \$8,527,264; increase since 1850, 29 per cent. Capital, Boydtown. II. A S. W. co. of N. C., bordering on S. C., bounded W. by the Catawba river; area estimated at 700 sq. m.; pop. in 1850, 18,914, of whom 5,478 were slaves. It has an elevated surface and fertile soil, and contains several gold mines. The productions in 1850 were 56,375 bushels of wheat, 549,162 of Indian corn, and 4,219 bales of cotton. There were 25 grist mills, 2 saw mills, 8 tanneries, 31 churches, and 1,854 pupils attending public schools. The Charlotte and South Carolina and the North Carolina central railroads have their termini at the capital, Charlotte. The people of Mecklenburg took an early and spirited part in the resistance to Great Britain; and in May, 1775, they publicly renounced allegiance to the crown and proclaimed their independence.

MECKLENBURG, a territory of northern Germany, divided into the two grand duchies of Mecklenburg-Schwerin and Mecklenburg-Strelitz, bounded N. by the Baltic sea, N. E. by Pomerania, S. E. and S. by Brandenburg, S. W. by Lüneburg, and W. by Lauenburg and Lübeck; area, 5,401 sq. m. The house of Mecklenburg is the oldest in Germany. Carlyle in his "Frederic the Great" says: "Mecklenburg is reckoned peculiarly Wendish. There are still to be seen there the physiognomies of a Wendish or Vandalic type, more of cheek than there ought to be, and less of brow; otherwise good enough physiognomies of their kind." The original inhabitants of Mecklenburg were of Germanic race, but were conquered during the great migration of nations by Slavic tribes. After long wars against the German monarchs, under the lead of native princes, the country was conquered by Henry the Lion of Saxony, who divided it among his nobles, and gave a part of it to Pribislav, the descendant of a native dynasty, under the name of the principality of Mecklenburg. The reigning house was subsequently divided into two branches. The elder line was founded by Johannes Theologus, whose grandson Henry II. (1302-'29) enriched it by the domain of Stargard. The sons of the latter, Albrecht and Johann, were made dukes in 1349; and a great-grandson of the former became duke of the whole of Mecklenburg. Afterward it was again divided into two lines until 1627, when, on account of a supposed alliance with Denmark, Wallenstein was made ruler of the country. In 1632 the expelled dukes were restored to power by Gustavus Adolphus, and shortly after the final division of the country into the two parts took place.—MECKLENBURG-SCHWERIN has an area of 4,701 sq. m.; pop. in 1858, 542,148, chiefly Lutherans. A ridge of hills traverses the country, but its surface is generally level. It abounds with forests and lakes. Lake Müritz is the largest, and Lake Malchinar most

remarkable for its fine scenery. The chief river is the Warnow, which at Rostock expands to a breadth of about 2,500 feet, and falls into the sea at Warnemünde. The soil is fertile and well cultivated. Agriculture is the chief employment of the population. The principal product is wheat. Horned cattle, horses, and sheep are numerous. The exports were valued in 1857 at \$20,000,000, and the imports at near \$10,000,000. The registered shipping comprised in 1859 nearly 400 seafaring vessels and 6 steamers, beside about 60 coasting vessels. The principal seat of learning is the university of Rostock, beside which there are 5 gymnasia, a normal school, and 50 public schools. The seat of the supreme court of appeal for Mecklenburg-Schwerin as well as for Mecklenburg-Strelitz is Rostock, the legislature of the two duchies being united, and assembling at Sternberg and Malchin alternately. The grand duke (in 1860, Frederic Francis), assisted by a ministry of state, wields the executive power, and proposes laws, which must be ratified by the legislature, who must also give their consent to the imposition of taxes. The legislature consists of about 600 rich and powerful land owners, chiefly nobles, and of the deputies of the towns. In 1849 a new constitution was promulgated, but it was opposed by the legislature, and withdrawn in 1850. The aggregate receipts and expenditures are about \$5,000,000 annually. The public debt is \$600,000. The military force comprises 5,880 men, 1,408 horses, and 14 cannons. The country is divided into the provinces of Mecklenburg and Wenden, the principality of Schwerin, the city of Rostock, and the lordship of Wismar. It contains 40 towns, the largest of which, and the principal trading port, is Rostock. Capital, Schwerin.—MECKLENBURG-STRELITZ consists of two distinct portions, viz.: the duchy of Strelitz or county of Stargard (area, 560 sq. m.; pop. in 1851, 88,276) on the E., and the principality of Ratzeburg (area, 140 sq. m.; pop. 16,852) on the W. of Mecklenburg-Schwerin. Stargard contains 53 lakes, of which the Tollen lake is the largest. The principal river there is the Havel, and in Ratzeburg the Trave. The imports and exports amount to about \$500,000. The government is the same as in Mecklenburg-Schwerin, excepting in Ratzeburg, which is not represented in the legislature. The grand duke (in 1816, George, succeeded 1816) is assisted by a cabinet, and is noted for his great wealth. The receipts and expenditures amount to about \$500,000; the public debt amounts to nearly \$1,500,000. The contingent to the federal army consists of 718 men. Capital, Strelitz.

MEDALS. See NUMISMATICS.

MEDE, JOSEPH, an English clergyman and author, born in Berden, Essex, in Oct. 1566, died in Cambridge in Oct. 1638. He was graduated at Christ's college, Cambridge, in 1610, and subsequently obtained a fellowship. The most esteemed of his works is the *Clavis Apocalyptica*, which appeared in Latin in 1627, and in English in 1643. This was the first re-

tional attempt on the part of an English theologian to explain the Apocalypse. A collective edition of his works was published in London in 1672.

MEDEA, a mythical princess, a daughter of Eetes, king of Colchis, by the oceanid Idyia, or Hecate, daughter of Persea. She was famous for her skill in sorcery, and it was through her instrumentality that Jason, with whom she had fallen in love, was enabled to possess himself of the golden fleece. Medea accompanied her lover to Greece (see **ARGONAUTS**), and lived with him as his wife, but was subsequently deserted by Jason, who was fascinated by Creusa, the daughter of Creon, king of Corinth. In the fury of revenge Medea destroyed her own children by Jason, and sent to Creusa a poisoned garment which burned her to death. Then fleeing to Athens in a chariot drawn by winged dragons, she there married Ægeus, by whom she had several sons. Having been afterward detected however in laying snares for the destruction of Theseus, she was driven from Attica, and withdrew into Asia accompanied by her son Medus, who became the founder of the Median nation.

MEDFORD, a township of Middlesex co., Mass., at the head of navigation on Mystic river, 5 m. N. W. from Boston; pop. in 1855, 3,749. The Boston and Lowell railroad passes through this town, and a branch of the Boston and Maine leads to its centre. The town is noted for ship building. From 1800 to 1855, 513 vessels were built here, the tonnage of which was 232,906 tons, and the value \$10,449,270. The other productions are railroad cars, coaches, tin ware, leather, boots and shoes, sashes, doors, blades, distilled liquors, bread, casks, hats, caps, cabinet ware, saddles, harnesses, and trunks. Tufts college is situated in Medford, on Walnut hill, near the boundary line of the adjoining town of Somerville. It was founded by Universalists, the first steps being taken by a convention at New York in May, 1847, and the subscriptions amounting in 1851 to \$100,000. Medford having been selected as the site of the college, the corner stone of the edifice was laid July 19, 1853, and the building finished in the spring of 1854. It is a brick structure, 100 by 50 feet, and 3 stories high. The college was named in honor of Charles Tufts, who made to it a donation of 70 acres of valuable land for a site. Beside this property, it has received from subscriptions, bequests, and state appropriations nearly \$200,000. It has small but well-selected philosophical and chemical apparatus, a mineralogical cabinet, and a library of 8,000 vols. The institution was opened in Aug. 1854. The first president (1860) is the Rev. Hosea Ballou, 2d, D.D., elected in 1853, who is assisted by 4 professors. The number of alumni is 22; of students in 1860, 58.

MEDHURST, **WALTER HENRY**, an English oriental scholar and missionary, born in London in 1796, died there Jan. 24, 1857. He was educated for the ministry, and in 1816, under the auspices of the church missionary society,

made a tour through India and Malacca, establishing himself in 1822 in Batavia in the island of Java, where he remained 8 years. During this interval and for several years afterward he pursued his missionary labors also in Borneo and on the coasts of China. After a residence of 2 years in England, he returned to the East, and in 1843 settled in Shanghai. Subsequently he passed 6 years of considerable labor and peril in the interior of China, and in 1856 returned in ill health to London, where he died 8 days after his arrival. Apart from his duties as a missionary, he was an industrious and intelligent student of the languages and literatures of eastern Asia, being well versed in the Chinese, Japanese, Javanese, and other dialects, beside Dutch, French, and English, in all of which he wrote. Beside a Chinese version of the Bible, he was engaged in four works of considerable magnitude and importance: "Chinese Repository" (20 vols., Canton, 1838-'51); "Chinese Miscellanies" (8 vols., Shanghai, 1849-'53); a "Chinese and English Dictionary" (2 vols., Batavia, 1842-'8); and an "English and Chinese Dictionary" (2 vols., Shanghai, 1847-'8). His remaining philosophical works are: "English and Japanese Vocabulary" (Batavia, 1830); "Dictionary of the Hokkien Dialect" (Macao, 1832-'9); "Translation of a Comparative Vocabulary of the Languages of China, Corea, and Japan" (Batavia, 1835); "Notes on Chinese Grammar" (Batavia, 1842); "Chinese Dialogues" (Shanghai, 1844), &c. In 1838 he published in London an interesting work entitled "China, its State and Prospects," which has been a text book with those taking an interest in missionary enterprises in that part of the world. He is also the author of an "Account of the Malayan Archipelago," "A Glance at the Interior of China," and several minor works.

MEDIA (Old Pers. *Mada*; Heb. *Maday*), an ancient country of Asia, bounded N. by Armenia, from which it was partly separated by the Araxes (Aras) river and the Caspian sea; E. by Hyrcania, Parthia, and the desert of Aria; S. by Persis, S. W. by Susiana, and W. by Assyria and Armenia. It thus corresponded nearly to the modern Persian province of Irak-Ajeme. It formed the westernmost part of the tableland of Iran, being for the most part fertile, and producing wine, figs, and oranges, and an excellent breed of horses, the Nisæan plain, near Rhagæ, being renowned in the times of the Persian dominion as supplying the studs of the great king and his nobles. The most important mountain range in the interior was the Caspian (now Elburz) mountains, the territory between which and the Caspian sea was inhabited by independent tribes; one of the principal rivers was the Amardus, emptying into that sea. Media was well peopled, originally by Turanian Scythæ, who, according to Berosus, seem even to have founded one of the earliest dynasties of Babylon. In the times of Herodotus, and according to his statement, it was occupied by 6 tribes, the Buze, Parataceni, Struchates, Arizanti, Bu-

dii, and Magi, who are said by the Halicarnassian historian and believed by the principal modern critics to have been a kindred race to the Persians, that is, a branch of the great Aryan family. In the time of the Persian power they, or at least a large part of them, spoke the same language as the dominant race, and had the same laws, manners, and religion. On the other hand, there is great difficulty in determining when the supremacy of the Aryan element over the original Turanian or Scythic began, how far the two were blended together, and what relation they occupied to each other during the period of special Median history. According to Ctesias, the Medes revolted from the Assyrians and became independent under Arbaces about 875 B. C.; but his whole story about the fall of that empire and the death of its king Sardanapalus is now discredited, as being either entirely fictitious, or at least inaccurate in dates and names. About the same period the Medes first appear in real history, occupying the region S. of the Caspian, when the Assyrian monarch whose expeditions are recorded on the black obelisk in the British museum, made the earliest authentic assault on their independence. Thus also the list of 8 successors to Arbaces on the throne of Media, given by Ctesias, can find no credit with critics, especially as his names and dates are entirely at variance with those given by Herodotus. According to the latter, Media, having been for centuries under the sway of the Assyrian monarchs, afforded the first example of a successful revolt to the nations suffering under the same yoke, apparently in the latter half of the 8th century. The people, however, having elected no common chief, suffered greatly from anarchy until a popular judge, Deioces, secured by stratagem his appointment as ruler of the united state (about 708), by common consent of the Medes, when he also founded a fortified capital, Ecbatana. He was succeeded by his son Phraortes, who, says Herodotus, "not being satisfied with a dominion which did not extend beyond the single people of the Medes," attacked and subdued the Persians, and with the united forces of these two nations engaged in war with the Assyrians, but perished with the greater part of his army, about 688. The authenticity of this Herodotean account of the two first Median reigns is, however, almost unconditionally rejected by the latest critical expounder of the Greek historian, Rawlinson, chiefly on the ground that the time fixed by Herodotus for the Median war of independence can be proved from the monuments to be the same in which Sargon, king of Assyria, made several successful expeditions for the subjugation of Media, which in his palace at Khorsabad also appears as a portion of his dominions. But this evidence against the accuracy of Herodotus's information is greatly invalidated by the testimony of other monuments erected by Sargon's successors Sennacherib and Esarhaddon; and Rawlinson himself acknowledges that "the condition of Media

during this period, like that of the other countries upon the borders of the great Assyrian kingdom, seems one which cannot properly be termed either subjection or independence." It would, therefore, be easy to reconcile the principal facts related by Herodotus, though not his entire account, with monumental history, by supposing his Deioces and Phraortes to have been either half independent viceroys of the Assyrian monarchs, or rulers in parts of Media which succeeded in conquering and maintaining their independence. But, without subscribing to the opinion of the learned critic concerning the imposition probably practised on Herodotus by his Median informant, who, "desirous of hiding the shame of his native land, purposely took the very date of its subjection, and represented it as that of the foundation of the monarchy," we must admire the ingenuity with which he fixes the Median chronology of his author. (See essay iii., book i.) According to Rawlinson, the Median kingdom was probably first established about 653 by Cyaxares, the third king of Herodotus. At all events, it was probably that monarch, generally regarded by Greeks and Asians as the founder of a dynasty, who made the Aryan element, to which he may have belonged, paramount in the kingdom, after a hard struggle against native and foreign Turanian tribes. The Aryan emigration from the East had for centuries been pressing upon the Turanian populations of the regions E. and S. of the Caspian, and under Cyaxares a violent struggle of the two races was after many years decided in favor of the former. This struggle Herodotus brings in connection with the invasion of Asia by the Cimmerians, relating that the Scythians, their pursuers, interrupted the conquests of the warlike Cyaxares, whose greatest achievement was the conquest of Nineveh in conjunction with Nabopolassar of Babylonia, and spread the terror of their arms as far as the confines of Egypt, holding sway over Asia for 28 years. A treacherous massacre is said to have terminated this sway, when Media, which under Cyaxares also waged a celebrated war against Alyattes of Lydia, became the first among the nations of Asia, another empire being simultaneously founded by its Babylonian ally. "The nature and duration of the struggle with the Scythians, the circumstances of the various wars, and even the order of their occurrence, are points to which no little doubt attaches." Nor can it be absolutely determined "whether the great Median prince began his career from the country about Rhages and the Caspian gates, where the Medes had been settled for two centuries, or led a fresh immigration from the region further to the eastward." The reign of Astyages, the son of Cyaxares, which lasted 35 years, was peaceful, but ended (about 550), with a catastrophe, which changed the united kingdom of "Media and Persia," as it is called in Scripture, into another styled Persia and Media, in which the people of the con-

queror, Cyrus, became the predominant race. The difficulty, however, which arises from the fact of a Darius Medus being represented in the book of Daniel as king of Babylon, has induced some critics to accept the relation of Xenophon, strengthened by that of Josephus, concerning the reign of a Cyaxares II., son and successor of Astyages, for whom Cyrus, his nephew, conquered Babylon, in preference to the detailed story of Herodotus; while others find Darius the Mede, not in a Cyaxares II., but in Astyages, who may have maintained a shadow of royalty under his grandson Cyrus. Both Media as a province, and its undoubtedly mixed population, continued prominent in the history of the new Aryan empire, though two great struggles for the recovery of independence, under Darius Hystaspes and Darius Nothus, failed. Many of the highest offices in the state were held by Medes; and the Scythic inscriptions on the Persian monuments prove the importance which was attached to the populations of the ancient Median provinces. The relation of the influential caste of the Magi to the Median tribe of the same name, as well as of the Scythic element of the Medo-Persian religion to the Aryan, is not yet satisfactorily cleared up. After the Macedonian conquest and the death of Alexander, a governor of the latter, Atropates, made himself independent in the N. W. part of Media, hence called Atropatene, which continued to exist as a kingdom down to the time of Augustus, while Great Media was under the successive rule of the Seleucids and Parthians. Both parts of ancient Media, the inhabitants of which had long lost their renown as warriors, were again united under the Neo-Persian kings.

MEDICAL JURISPRUDENCE, or the science of legal or forensic medicine, teaches the employment of the principles of medical science in the administration of law. In its relations to jurisprudence, medical learning is a branch of evidence in which the physician or surgeon is called in as an expert. The employment of medical experience in legislation is the proper province of sanitary or medical police, but with that subject the present has no necessary connection. There are traces both in the Jewish and Roman systems of the recognition of medical science in the application of laws; but forensic medicine cannot be said to have attained the dignity of a science until many centuries after the completion of the Justinian code—certainly not until anatomy was studied in the human subject in the 14th century; perhaps not before the publication of the Carolinian criminal code in 1552. The Roman law had referred all medical questions which arose in legal processes to “the authority of the learned Hippocrates.” The code of Charles V. enjoined the magistrate, in all cases of doubt respecting asserted pregnancy, infanticide, the means of homicide, and in other cases of death by violence, to consult the opinions of living medical men. During the latter part of the 16th century and
